| 23421 |                           | D1, XCU, ERN 287 (as modified by email #297) suggests the following replacement text for <b>ifelse</b> : "This function takes 3n+0 or 3n+1 arguments. For each group of 3 arguments, if the first and second are the same, the result is the third of the group. If the strings are not equal, and no arguments remain, the defining text is null. If one argument remains, it becomes the defining text. If three or more arguments remain, the process is repeated with the new group of three arguments. If 3n+2 arguments are provided, the evaluation proceeds as above, but a warning is generated and the last argument ignored.                                                                                     |
| 23422 |                           | If there are more than four arguments, the initial comparison of the first and second arguments are repeated for each group of three arguments. If no match is found, the defining text is the argument following the last set of three compared; otherwise, it is null.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 23483 |                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 23484 |                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 23485 | <b>EXIT STATUS</b>                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 23486 | The following exit values shall be returned: |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 23487 | 0                                            | Successful completion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

23488 >0 An error occurred

23489 If the **m4exit** macro is used, the exit value can be specified by the input file.

## 23490 CONSEQUENCES OF ERRORS

23491 Default.

## 23492 APPLICATION USAGE

23493 The **defn** macro is useful for renaming macros, especially built-ins.

## 23494 EXAMPLES

23495 An example of a single *m4* input file capable of generating two output files follows. The file  
23496 **file1.m4** could contain lines such as:

23497 `if(VER, 1, do_something)`

23498 `if(VER, 2, do_something)`

23499 The makefile for the program might include:

23500 `file1.1.c : file1.m4`

23501 `m4 -D VER=1 file1.m4 > file1.1.c`

23502 `...`

23503 `file1.2.c : file1.m4`

23504 `m4 -D VER=2 file1.m4 > file1.2.c`

23505 `...`

23506 The **-U** option can be used to undefine **VER**. If **file1.m4** contains:

23507 `if(VER, 1, do_something)`

23508 `if(VER, 2, do_something)`

23509 `ifndef(VER, do_something)`

23510 then the makefile would contain:

23511 `file1.0.c : file1.m4`

23512 `m4 -U VER file1.m4 > file1.0.c`

23513 `...`

23514 `file1.1.c : file1.m4`

23515 `m4 -D VER=1 file1.m4 > file1.1.c`

23516 `...`

23517 `file1.2.c : file1.m4`

23518 `m4 -D VER=2 file1.m4 > file1.2.c`

23519 `...`

## 23520 RATIONALE

23521 None.

## 23522 FUTURE DIRECTIONS

23523 None.

## 23524 SEE ALSO

23525 *c89*

## 23526 CHANGE HISTORY

23527 First released in Issue 2.

## 23528 Issue 4

23529 Format reorganized.

23530 Utility Syntax Guideline support mandated.

23531 Internationalized environment variable support mandated.

23532 **Issue 5**

23533 The phrase “the defined text for macros written by the **dumpdef** macro” is added to the  
23534 description of **STDERR**, and the description of **dumpdef** is updated to indicate that output is  
23535 written to standard error. The description of **eval** is updated to indicate that the list of excluded  
23536 C operators excludes unary **&** and **.**. In the description of **ifdef**, the phrase “and it is not  
23537 defined to be zero” is deleted.

23538 **Issue 6**

23539 In the EXTENDED DESCRIPTION, the **eval** text is updated to include a **&** character in the  
23540 excepted list. |

23541 The normative text is reworded to avoid use of the term “must” for application requirements. |

23542 **NAME**

23543           mailx — process messages

23544 **SYNOPSIS**23545           **Send Mode**23546           mailx [-s *subject*] *address...*23547           **Receive Mode**

23548           mailx -e

23549 MAN      mailx [-HiNn] [-F] [-u *user*]23550 MAN      mailx -f [-HiNn] [-F] [*file*]23551 **DESCRIPTION**

23552           The *mailx* utility provides a message sending and receiving facility. It has two major modes,  
 23553           selected by the options used: Send Mode and Receive Mode.

23554           On systems that do not support the User Portability Utilities option, an application using *mailx*  
 23555           shall have the ability to send messages in an unspecified manner (Send Mode). Unless the first  
 23556           character of one or more lines is tilde ('~'), all characters in the input message shall appear in  
 23557           the delivered message, but additional characters may be inserted in the message before it is  
 23558           retrieved.

23559           On systems supporting the User Portability Utilities option, mail-receiving capabilities and other  
 23560           interactive features, Receive Mode, described below, also shall be enabled.

23561           **Send Mode**

23562           Send Mode can be used by applications or users to send messages from the text in standard  
 23563           input.

23564           **Receive Mode**

23565           Receive Mode is more oriented to interactive users. Mail can be read and sent in this interactive  
 23566           mode.

23567           When reading mail, *mailx* provides commands to facilitate saving, deleting, and responding to  
 23568           messages. When sending mail, *mailx* allows editing, reviewing, and other modification of the  
 23569           message as it is entered.

23570           Incoming mail shall be stored in one or more unspecified locations for each user, collectively  
 23571           called the system *mailbox* for that user. When *mailx* is invoked in Receive Mode, the system  
 23572           mailbox shall be the default place to find new mail. As messages are read, they shall be marked  
 23573           to be moved to a secondary file for storage, unless specific action is taken. This secondary file is  
 23574           called the **mbox** and is normally located in the directory referred to by the *HOME* environment  
 23575           variable (see *MBOX* in the ENVIRONMENT VARIABLES section for a description of this file).  
 23576           Messages shall remain in this file until explicitly removed. When the -f option is used to read  
 23577           mail messages from secondary files, messages shall be retained in those files unless specifically  
 23578           removed. All three of these locations—system mailbox, **mbox**, and secondary file—are referred  
 23579           to in this section as simply “mailboxes”, unless more specific identification is required.

## 23580 OPTIONS

23581 The *mailx* utility shall conform to the System Interface Definitions volume of  
23582 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

23583 The following options shall be supported. (Only the **-s subject** option shall be required on all  
23584 systems. The other options are required only on systems supporting the User Portability Utilities  
23585 option.)

23586 **-e** Test for the presence of mail in the system mailbox. The *mailx* utility shall write  
23587 nothing and exit with a successful return code if there is mail to read.

23588 **-** Read messages from the file named by the *file* operand instead of the system  
23589 mailbox. (See also **folder**.) If no *file* operand is specified, read messages from the  
23590 **mbox** instead of the system mailbox.

23591 MAN **-F** Record the message in a file named after the first recipient. The name is the login-  
23592 name portion of the address found first on the **To:** line in the mail header.  
23593 Overrides the **record** variable, if set (see **Internal Variables in mailx** on page 626.)

23594 **-H** Write a header summary only.

23595 **-i** Ignore interrupts. (See also **ignore**).

23596 **-n** Do not initialize from the system default start-up file. See the EXTENDED  
23597 DESCRIPTION section.

23598 **-N** Do not write an initial header summary.

23599 **-s subject** Set the **Subject** header field to *subject*. All characters in the *subject* string shall  
23600 appear in the delivered message. The results are unspecified if *subject* is longer  
23601 than {LINE\_MAX} – 10 bytes or contains a <newline> character.

23602 **-u user** Read the system mailbox of the login name *user*. This shall only be successful if  
23603 the invoking user has the appropriate privileges to read the system mailbox of that  
23604 user.

## 23605 OPERANDS

23606 The following operands shall be supported:

23607 *address* Addressee of message. When **-n** is specified and no user start-up files are accessed  
23608 (see the EXTENDED DESCRIPTION section), the user or application shall ensure  
23609 this is an address to pass to the mail delivery system. Any system or user start-up  
23610 files may enable aliases (see **alias** under **Commands in mailx** on page 629) that  
23611 may modify the form of *address* before it is passed to the mail delivery system.

23612 *file* A path name of a file to be read instead of the system mailbox when **-f** is specified.  
23613 The meaning of the *file* option-argument shall be affected by the contents of the  
23614 **folder** internal variable; see **Internal Variables in mailx** on page 626.

## 23615 STDIN

23616 When *mailx* is invoked in Send Mode (the first synopsis line), standard input shall be the  
23617 message to be delivered to the specified addresses. When in Receive Mode, user commands are  
23618 accepted from *stdin*. If the User Portability Utilities option is not supported, standard input lines  
23619 beginning with a tilde ( '~ ') character produce unspecified results.

23620 If the User Portability Utilities option is supported, then in both Send and Receive Modes,  
23621 standard input lines beginning with the escape character (usually tilde ( '~ ')) affect processing  
23622 as described in **Command Escapes in mailx** on page 637.

## 23623 INPUT FILES

23624 When *mailx* is used as described by this volume of IEEE Std. 1003.1-200x, the *file* option-  
 23625 argument (see the *-f* option) and the **mbox** shall be text files containing mail messages,  
 23626 formatted as described in the OUTPUT FILES section. The nature of the system mailbox is  
 23627 unspecified; it need not be a file.

## 23628 ENVIRONMENT VARIABLES

23629 The following environment variables shall affect the execution of *mailx*:

23630 **DEAD** Determine the path name of the file in which to save partial messages in case of  
 23631 interrupts or delivery errors. The default shall be **dead.letter** in the directory  
 23632 named by the *HOME* variable. The behavior of *mailx* in saving partial messages is  
 23633 unspecified if the User Portability Utilities option is not supported and *DEAD* is  
 23634 not defined with the value */dev/null*.

23635 **EDITOR** Determine the name of a utility to invoke when the **edit** (see **Commands in mailx**  
 23636 on page 629) or **~e** (see **Command Escapes in mailx** on page 637) command is  
 23637 XSI used. The default editor is *ed*. The effects of this variable are unspecified if the User  
 23638 Portability Utilities option is not supported.

23639 **HOME** Determine the path name of the user's home directory.

23640 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 23641 If *LANG* is unset or null, the corresponding value from the implementation-  
 23642 dependent default locale shall be used. If any of the internationalization variables  
 23643 contains an invalid setting, the utility shall behave as if none of the variables had  
 23644 been defined.

23645 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 23646 internationalization variables.

23647 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 23648 characters (for example, single-byte as opposed to multi-byte characters in  
 23649 arguments and input files) and the handling of case-insensitive address and  
 23650 header-field comparisons.

23651 **LC\_TIME** Determine the format and contents of the date and time strings written by *mailx*.

## 23652 LC\_MESSAGES

23653 Determine the locale that should be used to affect the format and contents of  
 23654 diagnostic messages written to standard error and informative messages written to  
 23655 standard output.

23656 **LISTER** Determine a string representing the command for writing the contents of the  
 23657 **folder** directory to standard output when the **folders** command is given (see  
 23658 **folders** in **Commands in mailx** on page 629). Any string acceptable as a  
 23659 *command\_string* operand to the *sh -c* command shall be valid. If this variable is null  
 23660 or not set, the output command shall be *ls*. The effects of this variable are  
 23661 unspecified if the User Portability Utilities option is not supported.

23662 **MAILRC** Determine the path name of the start-up file. The default shall be **.mailrc** in the  
 23663 directory referred to by the *HOME* environment variable. The behavior of *mailx* is  
 23664 unspecified if the User Portability Utilities option is not supported and *MAILRC* is  
 23665 not defined with the value */dev/null*.

23666 **MBOX** Determine a path name of the file to save messages from the system mailbox that  
 23667 have been read. The **exit** command shall override this function, as shall saving the  
 23668 message explicitly in another file. The default shall be **mbox** in the directory

|       |                            |                                                                                                          |
|-------|----------------------------|----------------------------------------------------------------------------------------------------------|
| 23669 |                            | named by the <i>HOME</i> variable. The effects of this variable are unspecified if the                   |
| 23670 |                            | User Portability Utilities option is not supported.                                                      |
| 23671 | XSI                        | <b>NLSPATH</b> Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .     |
| 23672 |                            | <b>PAGER</b> Determine a string representing an output filtering or pagination command for               |
| 23673 |                            | writing the output to the terminal. Any string acceptable as a <i>command_string</i>                     |
| 23674 |                            | operand to the <i>sh -c</i> command shall be valid. When standard output is a terminal                   |
| 23675 |                            | device, the message output shall be piped through the command if the <i>mailx</i>                        |
| 23676 |                            | internal variable <b>crf</b> is set to a value less the number of lines in the message; see              |
| 23677 |                            | <b>Internal Variables in mailx</b> on page 626. If the <i>PAGER</i> variable is null or not set,         |
| 23678 |                            | the paginator shall be either <i>more</i> or another paginator utility documented in the                 |
| 23679 |                            | system documentation. The effects of this variable are unspecified if the User                           |
| 23680 |                            | Portability Utilities option is not supported.                                                           |
| 23681 |                            | <b>SHELL</b> Determine the name of a preferred command interpreter. The default shall be <i>sh</i> .     |
| 23682 |                            | The effects of this variable are unspecified if the User Portability Utilities option is                 |
| 23683 |                            | not supported.                                                                                           |
| 23684 |                            | <b>TERM</b> Determine the name of the terminal type, to indicate in an unspecified manner, if            |
| 23685 |                            | the internal variable <b>screen</b> is not specified, the number of lines in a screenful of              |
| 23686 |                            | headers. If <i>TERM</i> is not set or is set to null, an unspecified default terminal type               |
| 23687 |                            | shall be used and the value of a screenful is unspecified. The effects of this variable                  |
| 23688 |                            | are unspecified if the User Portability Utilities option is not supported.                               |
| 23689 |                            | <b>VISUAL</b> Determine a path name of a utility to invoke when the <b>visual</b> command (see           |
| 23690 |                            | <b>Commands in mailx</b> on page 629) or <i>~v</i> command-escape (see <b>Command Escapes</b>            |
| 23691 |                            | <b>in mailx</b> on page 637) is used. If this variable is null or not set, the full-screen               |
| 23692 |                            | editor shall be <i>vi</i> . The effects of this variable are unspecified if the User Portability         |
| 23693 |                            | Utilities option is not supported.                                                                       |
| 23694 | <b>ASYNCHRONOUS EVENTS</b> |                                                                                                          |
| 23695 |                            | When <i>mailx</i> is in Send Mode and standard input is not a terminal, it shall take the standard       |
| 23696 |                            | action for all signals.                                                                                  |
| 23697 |                            | In Receive Mode, or in Send Mode when standard input is a terminal, if a SIGINT signal is                |
| 23698 |                            | received:                                                                                                |
| 23699 |                            | 1. If in command mode, the current command, if there is one, shall be aborted, and a                     |
| 23700 |                            | command-mode prompt shall be written.                                                                    |
| 23701 |                            | 2. If in input mode:                                                                                     |
| 23702 |                            | a. If <b>ignore</b> is set, <i>mailx</i> shall write "@\n", discard the current input line, and continue |
| 23703 |                            | processing, bypassing the message-abort mechanism described in item 2b.                                  |
| 23704 |                            | b. If the interrupt was received while sending mail, either when in Receive Mode or in                   |
| 23705 |                            | Send Mode, a message shall be written, and another subsequent interrupt, with no                         |
| 23706 |                            | other intervening characters typed, shall be required to abort the mail message. If in                   |
| 23707 |                            | Receive Mode and another interrupt is received, a command-mode prompt shall be                           |
| 23708 |                            | written. If in Send Mode and another interrupt is received, <i>mailx</i> shall terminate with            |
| 23709 |                            | a non-zero status.                                                                                       |
| 23710 |                            | In both cases listed in item b, if the message is not empty:                                             |
| 23711 |                            | i. If <b>save</b> is enabled and the file named by <i>DEAD</i> can be created, the message               |
| 23712 |                            | shall be written to the file named by <i>DEAD</i> . If the file exists, the message shall                |
| 23713 |                            | be written to replace the contents of the file.                                                          |

23714                   ii. If **save** is not enabled, or the file named by *DEAD* cannot be created, the  
23715                   message shall not be saved.

23716           The *mailx* utility shall take the standard action for all other signals.

## 23717 **STDOUT**

23718           In command and input modes, all output, including prompts and messages, shall be written to  
23719           standard output.

## 23720 **STDERR**

23721           Used only for diagnostic messages.

## 23722 **OUTPUT FILES**

23723           Various *mailx* commands and command escapes can create or add to files, including the **mbox**,  
23724           the dead-letter file, and secondary mailboxes. When *mailx* is used as described in this volume of  
23725           IEEE Std. 1003.1-200x, these files shall be text files, formatted as follows:

23726           line beginning with **From**<space>  
23727           [one or more *header-lines*; see **Commands in mailx** on page 629]  
23728           *empty line*  
23729           [zero or more *body lines*  
23730           *empty line*]  
23731           [line beginning with **From**<space>...]

23732           where each message begins with the **From** <space> line shown, preceded by the beginning of  
23733           the file or an empty line. (The **From** <space> line is considered to be part of the message header,  
23734           but not one of the header-lines referred to in **Commands in mailx** on page 629; thus, it shall not  
23735           be affected by the **discard**, **ignore**, or **retain** commands.) The formats of the remainder of the  
23736           **From** <space> line and any additional header lines are unspecified, except that none shall be  
23737           empty. The format of a message body line is also unspecified, except that no line following an  
23738           empty line shall start with **From** <space>; *mailx* shall modify any such user-entered message  
23739           body lines (following an empty line and beginning with **From** <space>) by adding one or more  
23740           characters to precede the 'F'; it may add these characters to **From** <space> lines that are not  
23741           preceded by an empty line.

23742           When a message from the system mailbox or entered by the user is not a text file, it is  
23743           implementation-dependent how such a message is stored in files written by *mailx*.

## 23744 **EXTENDED DESCRIPTION**

23745           The entire Extended Description section shall apply only to implementations supporting the  
23746           User Portability Utilities option.

23747           The *mailx* utility cannot guarantee support for all character encodings in all circumstances. For  
23748           example, inter-system mail may be restricted to 7-bit data by the underlying network, 8-bit data  
23749           need not be portable to non-internationalized systems, and so on. Under these circumstances, it  
23750           is recommended that only characters defined in the ISO/IEC 646:1991 standard International  
23751           Reference Version (equivalent to ASCII) 7-bit range of characters be used.

23752           When *mailx* is invoked using one of the Receive Mode synopsis forms, it shall write a page of  
23753           header-summary lines (if **-N** was not specified and there are messages, see below), followed by  
23754           a prompt indicating that *mailx* can accept regular commands (see **Commands in mailx** on page  
23755           629); this is termed *command mode*. The page of header-summary lines shall contain the first new  
23756           message if there are new messages, or the first unread message if there are unread messages, or  
23757           the first message. When *mailx* is invoked using the Send Mode synopsis and standard input is a  
23758           terminal, if no subject is specified on the command line and the **asksub** variable is set, a prompt  
23759           for the subject shall be written. At this point, *mailx* is in input mode. This input mode is also  
23760           entered when using one of the Receive Mode synopsis forms and a reply or new message is

23761 composed using the **reply**, **Reply**, **followup**, **Followup**, or **mail** commands and standard input  
 23762 is a terminal. When the message is typed and the end of message is encountered, the message  
 23763 shall be passed to the mail delivery software. Commands can be entered by beginning a line  
 23764 with the escape character (by default, tilde ('~')) followed by a single command letter and  
 23765 optional arguments. See **Commands in mailx** on page 629 for a summary of these commands. It  
 23766 is unspecified what effect these commands will have if standard input is not a terminal when a  
 23767 message is entered using either the Send Mode synopsis, or the Read Mode commands **reply**,  
 23768 **Reply**, **followup**, **Followup**, or **mail**.

23769 **Note:** For notational convenience, this section uses the default escape character, tilde, in all  
 23770 references and examples.

23771 At any time, the behavior of *mailx* shall be governed by a set of environmental and internal  
 23772 variables. These are flags and valued parameters that can be set and cleared via the *mailx* **set**  
 23773 and **unset** commands.

23774 Regular commands are of the form:

23775 `[command] [msglist] [argument ...]`

23776 If no *command* is specified in command mode, **next** shall be assumed. In input mode, commands  
 23777 shall be recognized by the escape character, and lines not treated as commands shall be taken as  
 23778 input for the message.

23779 In command mode, each message shall be assigned a sequential number, starting with 1.

23780 All messages have a state that affects how they are displayed in the header summary and how  
 23781 they are retained or deleted upon termination of *mailx*. There is at any time the notion of a  
 23782 *current* message, marked by a '**>**' at the beginning of a line in the header summary. When *mailx*  
 23783 is invoked using one of the Receive Mode synopsis forms, the current message shall be the first  
 23784 new message, if there is a new message, or the first unread message if there is an unread  
 23785 message, or the first message if there are any messages, or unspecified if there are no messages  
 23786 in the mailbox. Each command that takes an optional list of messages (*msglist*) or an optional  
 23787 single message (*message*) on which to operate shall leave the current message set to the highest-  
 23788 numbered message of the messages specified, unless the command deletes messages, in which  
 23789 case the current message shall be set to the first undeleted message (that is, a message not in the  
 23790 deleted state) after the highest-numbered message deleted by the command, if one exists, or the  
 23791 first undeleted message before the highest-numbered message deleted by the command, if one  
 23792 exists, or to an unspecified value if there are no remaining undeleted messages. All messages are  
 23793 in one of the following states:

|       |               |                                                                                                                                                                                      |
|-------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 23794 | <i>new</i>    | The message is present in the system mailbox and has not been viewed by the user                                                                                                     |
| 23795 |               | or moved to any other state. Messages in state <i>new</i> when <i>mailx</i> quits shall be                                                                                           |
| 23796 |               | retained in the system mailbox.                                                                                                                                                      |
| 23797 | <i>unread</i> | The message has been present in the system mailbox for more than one invocation                                                                                                      |
| 23798 |               | of <i>mailx</i> and has not been viewed by the user or moved to any other state.                                                                                                     |
| 23799 |               | Messages in state <i>unread</i> when <i>mailx</i> quits shall be retained in the system mailbox.                                                                                     |
| 23800 | <i>read</i>   | The message has been processed by one of the following commands: <b>~f</b> , <b>~m</b> , <b>~F</b> , <b>~M</b> ,                                                                     |
| 23801 |               | <b>copy</b> , <b>mbox</b> , <b>next</b> , <b>pipe</b> , <b>print</b> , <b>Print</b> , <b>top</b> , <b>type</b> , <b>Type</b> , <b>undelete</b> . The <b>delete</b> , <b>dp</b> , and |
| 23802 |               | <b>dt</b> commands may also cause the next message to be marked as <i>read</i> , depending on                                                                                        |
| 23803 |               | the value of the <b>autoprint</b> variable. Messages that are in the system mailbox and in                                                                                           |
| 23804 |               | state <i>read</i> when <i>mailx</i> quits shall be saved in the <b>mbox</b> , unless the internal variable                                                                           |
| 23805 |               | <b>hold</b> was set. Messages that are in the <b>mbox</b> or in a secondary mailbox and in state                                                                                     |
| 23806 |               | <i>read</i> when <i>mailx</i> quits shall be retained in their current location.                                                                                                     |

|       |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 23807 | <i>deleted</i>   | The message has been processed by one of the following commands: <b>delete</b> , <b>dp</b> , <b>dt</b> . Messages in state <i>deleted</i> when <i>mailx</i> quits shall be deleted. Deleted messages shall be ignored until <i>mailx</i> quits or changes mailboxes or they are specified to the undelete command; for example, the message specification <i>/string</i> shall only search the subject lines of messages that have not yet been deleted, unless the command operating on the list of messages is <b>undelete</b> . No deleted message or deleted message header shall be displayed by any <i>mailx</i> command other than <b>undelete</b> . |

| 23817 | <i>saved</i>     | The message has been processed by one of the following commands: <b>save</b> or <b>write</b> . If the current mailbox is the system mailbox, and the internal variable <b>keepsave</b> is set, messages in the state <i>saved</i> shall be saved to the file designated by the <i>MBOX</i> variable (see the ENVIRONMENT VARIABLES section). If the current mailbox is the system mailbox, messages in the state <i>saved</i> shall be deleted from the current mailbox, when the <b>quit</b> or <b>file</b> command is used to exit the current mailbox.                                                                                                   |
| 23818 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

23849 Other arguments are usually arbitrary strings whose usage depends on the command involved.

## 23850 Start-Up in mailx

23851 At start-up time, *mailx* shall take the following steps in sequence:

- 23852 1. Establish all variables at their stated default values.
- 23853 2. Process command line options, overriding corresponding default values.
- 23854 3. Import any of the *DEAD*, *EDITOR*, *MBOX*, *LISTER*, *PAGER*, *SHELL*, or *VISUAL* variables  
23855 that are present in the environment, overriding the corresponding default values.
- 23856 4. Read *mailx* commands from an unspecified system start-up file, unless the **-n** option is  
23857 given, to initialize any internal *mailx* variables and aliases.
- 23858 5. Process the start-up file of *mailx* commands named in the user *MAILRC* variable.

23859 Most regular *mailx* commands are valid inside start-up files, the most common use being to set  
23860 up initial display options and alias lists. The following commands shall be invalid in the start-up  
23861 file: **!**, **edit**, **hold**, **mail**, **preserve**, **reply**, **Reply**, **shell**, **visual**, **Copy**, **followup**, and **Followup**. Any  
23862 errors in the start-up file shall either cause *mailx* to terminate with a diagnostic message and a  
23863 non-zero status or to continue after writing a diagnostic message, ignoring the remainder of the  
23864 lines in the start-up file.

23865 A blank line in a start-up file shall be ignored.

## 23866 Internal Variables in mailx

23867 The following variables are internal *mailx* variables. Each internal variable can be set via the  
23868 *mailx set* command at any time. The **unset** and **set no name** commands can be used to erase  
23869 variables.

23870 In the following list, variables shown as:

23871 variable

23872 represent Boolean values. Variables shown as:

23873 variable=value

23874 shall be assigned string or numeric values. For string values, the rules in **Commands in mailx** on  
23875 page 629 concerning file names and quoting also apply.

23876 The defaults specified here may be changed by the implementation-dependent system start-up  
23877 file unless the user specifies the **-n** option.

23878 **allnet** All network names whose login name components match are treated as identical.  
23879 This shall cause the *msglist* message specifications to behave similarly. The default  
23880 shall be **noallnet**. See also the **alternates** command and the **metoo** variable.

23881 **append** Append messages to the end of the **mbox** file upon termination instead of placing  
23882 them at the beginning. The default shall be **noappend**. This variable shall not  
23883 affect the **save** command when saving to the **mbox**.

## 23884 ask, asksub

23885 Prompt for a subject line on outgoing mail if one is not specified on the command  
23886 line with the **-s** option. The **ask** and **asksub** forms are synonyms; the system shall  
23887 refer to **asksub** and **noasksub** in its messages, but shall accept **ask** and **noask** as  
23888 user input to mean **asksub** and **noasksub**. It shall not be possible to set both **ask**  
23889 and **noasksub**, or **noask** and **asksub**. The default shall be **asksub**, but no

|           |                         |                                                                                                                                                                                                                                                                                                                                                                        |

| 23899     | <b>cmd=command</b>      |                                                                                                                                                                                                                                                                                                                                                                        |
| 23900     |                         | Set the default command to be invoked by the <b>pipe</b> command. The default shall be <b>nocmd</b> .                                                                                                                                                                                                                                                                  |
| 23901     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23902     | <b>crt=number</b>       | Pipe messages having more than <i>number</i> lines through the command specified by the value of the <i>PAGER</i> variable. The default shall be <b>nocrt</b> . If it is set to null, the value used is implementation-dependent.                                                                                                                                      |
| 23903     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23904     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23905 XSI | <b>debug</b>            | Enable verbose diagnostics for debugging. Messages are not delivered. The default shall be <b>nodebug</b> .                                                                                                                                                                                                                                                            |
| 23906     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23907     | <b>dot</b>              | When <b>dot</b> is set, a period on a line by itself during message input from a terminal shall also signify end-of-file (in addition to normal end-of-file). The default shall be <b>nodot</b> . If <i>ignoreeof</i> is set (see below), a setting of <b>nodot</b> shall be ignored and the period is the only method to terminate input mode.                        |
| 23908     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23909     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23910     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23911     | <b>escape=c</b>         | Set the command escape character to be the character ' c '. By default, the command escape character shall be tilde. If <b>escape</b> is unset, tilde shall be used; if it is set to null, command escaping shall be disabled.                                                                                                                                         |
| 23912     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23913     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23914     | <b>flipr</b>            | Reverse the meanings of the <b>R</b> and <b>r</b> commands. The default shall be <b>noflipr</b> .                                                                                                                                                                                                                                                                      |
| 23915     | <b>folder=directory</b> |                                                                                                                                                                                                                                                                                                                                                                        |
| 23916     |                         | The default directory for saving mail files. User-specified file names beginning with a plus sign ( ' + ' ) shall be expanded by preceding the file name with this directory name to obtain the real path name. If <i>directory</i> does not start with a slash ( ' / ' ), the contents of <i>HOME</i> shall be prefixed to it. The default shall be <b>nofolder</b> . |
| 23917     |                         | If <b>folder</b> is unset or set to null, user-specified file names beginning with ' + ' shall refer to files in the current directory that begin with the literal ' + ' character. See also <b>outfolder</b> below. The <b>folder</b> value need not affect the processing of the files named in <i>MBOX</i> and <i>DEAD</i> .                                        |
| 23918     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23919     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23920     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23921     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23922     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23923     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23924     | <b>header</b>           | Enable writing of the header summary when entering <i>mailx</i> in Receive Mode. The default shall be <b>header</b> .                                                                                                                                                                                                                                                  |
| 23925     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23926     | <b>hold</b>             | Preserve all messages that are read in the system mailbox instead of putting them in the <b>mbox</b> save file. The default shall be <b>nohold</b> .                                                                                                                                                                                                                   |
| 23927     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23928     | <b>ignore</b>           | Ignore interrupts while entering messages. The default shall be <b>noignore</b> .                                                                                                                                                                                                                                                                                      |
| 23929     | <i>ignoreeof</i>        |                                                                                                                                                                                                                                                                                                                                                                        |
| 23930     |                         | Ignore normal end-of-file during message input. Input can be terminated only by entering a period ( ' . ' ) on a line by itself or by the ~. command escape. The default shall be <b>noignoreeof</b> . See also <b>dot</b> above.                                                                                                                                      |
| 23931     |                         |                                                                                                                                                                                                                                                                                                                                                                        |
| 23932     |                         |                                                                                                                                                                                                                                                                                                                                                                        |

|           |                            |                                                                                                            |
|-----------|----------------------------|------------------------------------------------------------------------------------------------------------|
| 23933     | <b>indentprefix=string</b> |                                                                                                            |
| 23934     |                            | A string that shall be added as a prefix to each line that is inserted into the message                    |
| 23935     |                            | by the <b>~m</b> command escape. This variable shall default to one <tab> character.                       |
| 23936     | <b>keep</b>                | When a system mailbox, secondary mailbox, or <b>mbox</b> is empty, truncate it to zero                     |
| 23937     |                            | length instead of removing it. The default shall be <b>nokeep</b> .                                        |
| 23938     | <b>keepsave</b>            | Keep the messages that have been saved from the system mailbox into other files                            |
| 23939     |                            | in the file designated by the variable <i>MBOX</i> , instead of deleting them. The default                 |
| 23940     |                            | shall be <b>nokeepsave</b> .                                                                               |
| 23941     | <b>metoo</b>               | Suppress the deletion of the login name of the user from the recipient list when                           |
| 23942     |                            | replying to a message or sending to a group. The default shall be <b>nometoo</b> .                         |
| 23943 XSI | <b>onehop</b>              | When responding to a message that was originally sent to several recipients, the                           |
| 23944     |                            | other recipient addresses are normally forced to be relative to the originating                            |
| 23945     |                            | author's machine for the response. This flag disables alteration of the recipients'                        |
| 23946     |                            | addresses, improving efficiency in a network where all machines can send directly                          |
| 23947     |                            | to all other machines (that is, one hop away). The default shall be <b>noonehop</b> .                      |
| 23948     | <b>outfolder</b>           | Cause the files used to record outgoing messages to be located in the directory                            |
| 23949     |                            | specified by the <b>folder</b> variable unless the path name is absolute. The default shall                |
| 23950     |                            | be <b>nooutfolder</b> . See the <b>record</b> variable.                                                    |
| 23951     | <b>page</b>                | Insert a <form-feed> after each message sent through the pipe created by the <b>pipe</b>                   |
| 23952     |                            | command. The default shall be <b>nopage</b> .                                                              |
| 23953     | <b>prompt=string</b>       |                                                                                                            |
| 23954     |                            | Set the command-mode prompt to <i>string</i> . If <i>string</i> is null or if <b>noprompt</b> is set, no   |
| 23955     |                            | prompting shall occur. The default shall be to prompt with the string " ? ".                               |
| 23956     | <b>quiet</b>               | Refrain from writing the opening message and version when entering <i>mailx</i> . The                      |
| 23957     |                            | default shall be <b>noquiet</b> .                                                                          |
| 23958     | <b>record=file</b>         | Record all outgoing mail in the file with the path name <i>file</i> . The default shall be                 |
| 23959     |                            | <b>no record</b> . See also <b>outfolder</b> above.                                                        |
| 23960     | <b>save</b>                | Enable saving of messages in the dead-letter file on interrupt or delivery error. See                      |
| 23961     |                            | the variable <i>DEAD</i> for the location of the dead-letter file. The default shall be <b>save</b> .      |
| 23962     | <b>screen=number</b>       |                                                                                                            |
| 23963     |                            | Set the number of lines in a screenful of headers for the <b>headers</b> and <b>z</b> commands.            |
| 23964     |                            | If <b>screen</b> is not specified, a value based on the terminal type identified by the                    |
| 23965     |                            | <i>TERM</i> environment variable, the window size, the baud rate, or some combination                      |
| 23966     |                            | of these shall be used.                                                                                    |
| 23967 MAN | <b>sendwait</b>            | Wait for the background mailer to finish before returning. The default shall be                            |
| 23968     |                            | <b>no sendwait</b> .                                                                                       |
| 23969     | <b>showto</b>              | When the sender of the message was the user who is invoking <i>mailx</i> , write the                       |
| 23970     |                            | information from the <b>To:</b> line instead of the <b>From:</b> line in the header summary.               |
| 23971     |                            | The default shall be <b>noshowto</b> .                                                                     |
| 23972     | <b>sign=string</b>         | Set the variable inserted into the text of a message when the <b>~a</b> command escape is                  |
| 23973     |                            | given. The default shall be <b>no sign</b> . The character sequences ' <b>\t</b> ' and ' <b>\n</b> ' shall |
| 23974     |                            | be recognized in the variable as <tab> and <newline> characters, respectively. (See                        |
| 23975     |                            | also <b>~i</b> in <b>Command Escapes in mailx</b> on page 637.)                                            |
| 23976     | <b>Sign=string</b>         | Set the variable inserted into the text of a message when the <b>~A</b> command escape is                  |
| 23977     |                            | given. The default shall be <b>no Sign</b> . The character sequences ' <b>\t</b> ' and ' <b>\n</b> ' shall |

23978 be recognized in the variable as <tab> and <newline> characters, respectively.

23979 **toplines=number**

23980 Set the number of lines of the message to write with the **top** command. The default  
23981 shall be 5.

## 23982 **Commands in mailx**

23983 The following *mailx* commands shall be provided. In the following list, header refers to lines  
23984 from the message header, as shown in the OUTPUT FILES section. Header-line refers to lines  
23985 within the header that begin with one or more non-white-space characters, immediately  
23986 followed by a colon and white space and continuing until the next line beginning with a non-  
23987 white-space character or an empty line. Header-field refers to the portion of a header line prior  
23988 to the first colon in that line.

23989 For each of the commands listed below, the command can be entered as the abbreviation (those  
23990 characters in the Synopsis command word preceding the '[ ' '), the full command (all characters  
23991 shown for the command word, omitting the '[ ' ' and ' ] ' '), or any truncation of the full  
23992 command down to the abbreviation. For example, the **exit** command (shown as **ex[it]** in the  
23993 Synopsis) can be entered as **ex**, **exi**, or **exit**.

23994 The arguments to commands can be quoted, using the following methods:

- 23995 • An argument can be enclosed between paired double-quotes (" ") or single-quotes (" ' ' ");  
23996 any white space, shell word expansion, or backslash characters within the quotes shall be  
23997 treated literally as part of the argument. A double-quote shall be treated literally within  
23998 single-quotes and *vice versa*. These special properties of the quote marks shall occur only  
23999 when they are paired at the beginning and end of the argument.
- 24000 • A backslash outside of the enclosing quotes shall be discarded and the following character  
24001 treated literally as part of the argument.
- 24002 • An unquoted backslash at the end of a command line shall be discarded and the next line  
24003 shall continue the command.

24004 File names, where expected, shall be subjected to the process of shell word expansions (see  
24005 Section 2.6 on page 49); if more than a single path name results and the command is expecting  
24006 one file, the effects are unspecified. If the file name begins with an unquoted plus sign, it shall  
24007 not be expanded, but treated as the named file (less the leading plus) in the **folder** directory. (See  
24008 the **folder** variable.)

## 24009 **Declare Aliases**

24010 *Synopsis:*     a[lias] [alias [address...]]  
24011               g[roup] [alias [address...]]

24012 Add the given addresses to the alias specified by *alias*. The names shall be substituted when  
24013 *alias* is used as a recipient address specified by the user in an outgoing message (that is, other  
24014 recipients addressed indirectly through the **reply** command shall not be substituted in this  
24015 manner). Mail address alias substitution shall apply only when the alias string is used as a full  
24016 address; for example, when **hlj** is an alias, **hlj@posix.com** does not trigger the alias substitution. If  
24017 no arguments are given, write a listing of the current aliases to standard output. If only an *alias*  
24018 argument is given, write a listing of the specified alias to standard output. These listings need  
24019 not reflect the same order of addresses that were entered.

24020 **Declare Alternatives**

24021 *Synopsis:*     alt[ernates] *name...*

24022 (See also the **metoo** command.) Declare a list of alternative names for the user's login. When  
 24023 responding to a message, these names shall be removed from the list of recipients for the  
 24024 response. The comparison of names shall be in a case-insensitive manner. With no arguments,  
 24025 **alternates** shall write the current list of alternative names.

24026 **Change Current Directory**

24027 *Synopsis:*     cd [*directory*]  
 24028                 ch[dir] [*directory*]

24029 Change directory. If *directory* is not specified, the contents of *HOME* shall be used.

24030 **Copy Messages**

24031 *Synopsis:*     c[opy] [*file*]  
 24032                 c[opy] [*msglist*] *file*  
 24033 MAN           C[opy] [*msglist*]

24034 Copy messages to the file named by the path name *file* without marking the messages as saved.  
 24035 Otherwise, it shall be equivalent to the **save** command.

24036 MAN In the capitalized form, save the specified messages in a file whose name is derived from the  
 24037 author of the message to be saved, without marking the messages as saved. Otherwise, it shall  
 24038 be equivalent to the **Save** command.

24039 **Delete Messages**

24040 *Synopsis:*     d[ele]te [*msglist*]

24041 Mark messages for deletion from the mailbox. The deletions shall not occur until *mailx* quits (see  
 24042 the **quit** command) or changes mailboxes (see the **folder** command). If **autoprint** is set and there  
 24043 are messages remaining after the **delete** command, the current message shall be written as  
 24044 described for the **print** command (see the **print** command); otherwise, the *mailx* prompt shall be  
 24045 written.

24046 **Discard Header Fields**

24047 *Synopsis:*     di[scard] [*header-field...*]  
 24048                 ig[nore] [*header-field...*]

24049 Suppress the specified header fields when writing messages. Specified *header-fields* shall be  
 24050 added to the list of suppressed header fields. Examples of header fields to ignore are **status** and  
 24051 **cc**. The fields shall be included when the message is saved. The **Print** and **Type** commands shall  
 24052 override this command. The comparison of header fields shall be in a case-insensitive manner. If  
 24053 no arguments are specified, write a list of the currently suppressed header fields to standard  
 24054 output; the listing need not reflect the same order of header fields that were entered.

24055 If both **retain** and **discard** commands are given, **discard** commands shall be ignored.

## 24056 Delete Messages and Display

24057 *Synopsis:*    dp [*msglist*]  
 24058               dt [*msglist*]

24059 Delete the specified messages as described for the **delete** command, except that the **autoprint**  
 24060 variable shall have no effect, and the current message shall be written only if it was set to a  
 24061 message after the last message deleted by the command. Otherwise, an informational message  
 24062 to the effect that there are no further messages in the mailbox shall be written, followed by the  
 24063 *mailx* prompt.

## 24064 Echo a String

24065 *Synopsis:*    ec[ho] *string* ...

24066 Echo the given strings, equivalent to the shell *echo* utility.

## 24067 Edit Messages

24068 *Synopsis:*    e[dit] [*msglist*]

24069 Edit the given messages. The messages shall be placed in a temporary file and the utility named  
 24070 by the *EDITOR* variable is invoked to edit each file in sequence. The default *EDITOR* is  
 24071 unspecified.

24072 The **edit** command does not modify the contents of those messages in the mailbox.

## 24073 Exit

24074 *Synopsis:*    ex[it]  
 24075               x[it]

24076 Exit from *mailx* without changing the mailbox. No messages shall be saved in the **mbox** (see also  
 24077 **quit**).

## 24078 Change Folder

24079 *Synopsis:*    fi[le] [*file*]  
 24080               fold[er] [*file*]

24081 Quit (see the **quit** command) from the current file of messages and read in the file named by the  
 24082 path name *file*. If no argument is given, the name and status of the current mailbox shall be  
 24083 written.

24084 Several unquoted special characters shall be recognized when used as *file* names, with the  
 24085 following substitutions:

24086 %           The system mailbox for the invoking user.

24087 %*user*      The system mailbox for *user*.

24088 #           The previous file.

24089 &           The current **mbox**.

24090 +*file*      The named file in the **folder** directory. (See the **folder** variable.)

24091 The default file shall be the current mailbox.

24092 **Display List of Folders**24093 *Synopsis:*     **folders**

24094 Write the names of the files in the directory set by the **folder** variable. The command specified by  
 24095 the *LISTER* environment variable shall be used (see the ENVIRONMENT VARIABLES section).

24096 **Follow Up Specified Messages**24097 **Notes to Reviewers**24098 *This section with side shading will not appear in the final copy. - Ed.*

24099 D1, XCU, ERN 300 raises an issue re this text. An action item is outstanding.

24100 MAN *Synopsis:*     **fo**[llowup] [*message*]24101               **F**[ollowup] [*msglist*]

24102 In the lowercase form, respond to a message, recording the response in a file whose name is  
 24103 derived from the author of the message. Overrides the **record** variable, if set. See also the **save**  
 24104 and **copy** commands and **outfolder**.

24105 In the capitalized form, respond to the first message in the *msglist*, sending the message to the  
 24106 author of each message in the *msglist*. The subject line shall be taken from the first message and  
 24107 the response shall be recorded in a file whose name is derived from the author of the first  
 24108 message. See also the **Save** and **Copy** commands and **outfolder**.

24109 **Display Header Summary for Specified Messages**24110 *Synopsis:*     **f**[rom] [*msglist*]

24111 Write the header summary for the specified messages.

24112 **Display Header Summary**24113 *Synopsis:*     **h**[eaders] [*message*]

24114 Write the page of headers that includes the message specified. If the *message* argument is not  
 24115 specified, the current message shall not change. However, if the *message* argument is specified,  
 24116 the current message shall become the message that appears at the top of the page of headers that  
 24117 includes the message specified. The **screen** variable sets the number of headers per page. See  
 24118 also the **z** command.

24119 **Help**24120 *Synopsis:*     **hel**[p]

24121               ?

24122 Write a summary of commands.

24123 **Hold Messages**24124 *Synopsis:*     **ho**[ld] [*msglist*]24125               **pre**[serve] [*msglist*]

24126 Mark the messages in *msglist* to be retained in the mailbox when *mailx* terminates. This shall  
 24127 override any commands that might previously have marked the messages to be deleted. During  
 24128 the current invocation of *mailx*, only the **delete**, **dp**, or **dt** commands shall remove the *preserve*  
 24129 marking of a message.

24130        **Execute Commands Conditionally**

24131        *Synopsis:*     i[f] s|r  
 24132                    mail-commands  
 24133                    el[se]  
 24134                    mail-commands  
 24135                    en[dif]

24136        Execute commands conditionally, where **if s** executes the following *mail-commands*, up to an  
 24137        **else** or **endif**, if the program is in Send Mode, and **if r** shall cause the *mail-commands* to be  
 24138        executed only in Receive Mode.

24139        **List Available Commands**

24140        *Synopsis:*     l[ist]

24141        Write a list of all commands available. No explanation shall be given.

24142        **Mail a Message**

24143        *Synopsis:*     m[ail] address...

24144        Mail a message to the specified addresses or aliases.

24145        **Direct Messages to mbox**

24146        *Synopsis:*     mb[ox] [msglist]

24147        Arrange for the given messages to end up in the **mbox** save file when *mailx* terminates normally.  
 24148        See *MBOX*. See also the **exit** and **quit** commands.

24149        **Process Next Specified Message**

24150        *Synopsis:*     n[ext] [message]

24151        If the current message has not been written (for example, by the **print** command) since *mailx*  
 24152        started or since any other message was the current message, behave as if the **print** command  
 24153        was entered. Otherwise, if there is an undeleted message after the current message, make it the  
 24154        current message and behave as if the **print** command was entered. Otherwise, an informational  
 24155        message to the effect that there are no further messages in the mailbox shall be written, followed  
 24156        by the *mailx* prompt.

24157        **Pipe Message**

24158        *Synopsis:*     pi[pe] [[msglist] command]  
 24159                    | [[msglist] command]

24160        Pipe the messages through the given *command* by invoking the command interpreter specified  
 24161        by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) The application shall ensure  
 24162        that the command is given as a single argument. Quoting, described previously, can be used to  
 24163        accomplish this. If no arguments are given, the current message shall be piped through the  
 24164        command specified by the value of the **cmd** variable. If the **page** variable is set, a <form-feed>  
 24165        character shall be inserted after each message.

24166        **Display Message with Headers**

24167        *Synopsis:*     P[rint] [msglist]  
 24168                    T[ype] [msglist]

24169        Write the specified messages, including all header lines, to standard output. Override  
 24170        suppression of lines by the **discard**, **ignore**, and **retain** commands. If **crt** is set, the messages  
 24171        longer than the number of lines specified by the **crt** variable shall be paged through the  
 24172        command specified by the *PAGER* environment variable.

24173        **Display Message**

24174        *Synopsis:*     p[rint] [msglist]  
 24175                    t[ype] [msglist]

24176        Write the specified messages to standard output. If **crt** is set, the messages longer than the  
 24177        number of lines specified by the **crt** variable shall be paged through the command specified by  
 24178        the *PAGER* environment variable.

24179        **Quit**

24180        *Synopsis:*     q[uit]  
 24181                    end-of-file

24182        Terminate *mailx*, storing messages that were read in **mbox** (if the current mailbox is the system  
 24183        mailbox and unless **hold** is set), deleting messages that have been explicitly saved (unless  
 24184        **keepsave** is set), discarding messages that have been deleted, and saving all remaining messages  
 24185        in the mailbox.

24186        **Reply to a Message List**

24187        *Synopsis:*     R[eply] [msglist]  
 24188                    R[espond] [msglist]

24189        Mail a reply message to the sender of each message in the *msglist*. The subject line shall be  
 24190        formed by concatenating **Re:**<space> (unless it already begins with that string) and the subject  
 24191        from the first message. If **record** is set to a file name, the response shall be saved at the end of  
 24192        that file.

24193        See also the **flipr** variable.

24194        **Reply to a Message**

24195        *Synopsis:*     r[eply] [message]  
 24196                    r[espond] [message]

24197        Mail a reply message to all recipients included in the header of the message. The subject line  
 24198        shall be formed by concatenating **Re:**<space> (unless it already begins with that string) and the  
 24199        subject from the message. If **record** is set to a file name, the response shall be saved at the end of  
 24200        that file.

24201        See also the **flipr** variable.

24202      **Retain Header Fields**24203      *Synopsis:*      `ret[ain] [header-field...]`

24204      Retain the specified header fields when writing messages. This command shall override all  
 24205      **discard** and **ignore** commands. The comparison of header fields shall be in a case-insensitive  
 24206      manner. If no arguments are specified, write a list of the currently retained header fields to  
 24207      standard output; the listing need not reflect the same order of header fields that were entered.

24208      **Save Messages**

24209      *Synopsis:*      `s[ave] [file]`  
 24210                    `s[ave] [msglist] file`  
 24211 MAN            `S[ave] [msglist]`

24212      Save the specified messages in the file named by the path name *file*, or the **mbox** if the *file*  
 24213      argument is omitted. The file shall be created if it does not exist; otherwise, the messages shall be  
 24214      appended to the file. The message shall be put in the state *saved*, and shall behave as specified in  
 24215      the description of the *saved* state when the current mailbox is exited by the **quit** or **file**  
 24216      command.

24217 MAN      In the capitalized form, save the specified messages in a file whose name is derived from the  
 24218      author of the first message. The name of the file shall be taken to be the author's name with all  
 24219      network addressing stripped off. See also the **Copy**, **followup**, and **Followup** commands and  
 24220      **outfolder** variable.

24221      **Set Variables**24222      *Synopsis:*      `se[t] [name=[string]] ...] [name=number ...] [noname ...]`

24223      Define one or more variables called *name*. The variable can be given a null, string, or numeric  
 24224      value. Quoting and backslash escapes can occur anywhere in *string*, as described previously, as  
 24225      if the *string* portion of the argument were the entire argument. The forms *name* and *name*= shall  
 24226      be equivalent to *name*="" for variables that take string values. The **set** command without  
 24227      arguments shall write a list of all defined variables and their values. The **no name** form shall be  
 24228      equivalent to **unset name**.

24229      **Invoke a Shell**24230      *Synopsis:*      `sh[ell]`24231      Invoke an interactive command interpreter (see also *SHELL*).24232      **Display Message Size**24233      *Synopsis:*      `si[ze] [msglist]`

24234      Write the size in bytes of each of the specified messages.

24235      **Read mailx Commands From a File**24236      *Synopsis:*      `so[urce] file`

24237      Read and execute commands from the file named by the path name *file* and return to command  
 24238      mode.

### 24239 **Display Beginning of Messages**

24240 *Synopsis:*    to[p] [msglist]

24241 Write the top few lines of each of the specified messages. If the **toplines** variable is set, it is taken  
24242 as the number of lines to write. The default shall be 5.

### 24243 **Touch Messages**

24244 *Synopsis:*    tou[ch] [msglist]

24245 Touch the specified messages. If any message in *msglist* is not specifically deleted nor saved in a  
24246 file, it shall be placed in the **mbox** upon normal termination. See **exit** and **quit**.

### 24247 **Delete Aliases**

24248 *Synopsis:*    una[lias] [alias]...

24249 Delete the specified alias names. If a specified alias does not exist, the results are unspecified.

### 24250 **Undelete Messages**

24251 *Synopsis:*    u[ndelete] [msglist]

24252 Change the state of the specified messages from deleted to read. If **autoprint** is set, the last  
24253 message of those restored shall be written. If *msglist* is not specified, the message shall be  
24254 selected as follows:

- 24255       • If there are any deleted messages that follow the current message, the first of these shall be  
24256       chosen.
- 24257       • Otherwise, the last deleted message that also precedes the current message shall be chosen.

### 24258 **Unset Variables**

24259 *Synopsis:*    uns[et] name...

24260 Cause the specified variables to be erased.

### 24261 **Edit Message with Full-Screen Editor**

24262 *Synopsis:*    v[isual] [msglist]

24263 Edit the given messages with a screen editor. Each message shall be placed in a temporary file,  
24264 and the utility named by the *VISUAL* variable shall be invoked to edit each file in sequence. The  
24265 default editor shall be *vi*.

24266 The **visual** command does not modify the contents of those messages in the mailbox.

### 24267 **Write Messages to a File**

24268 *Synopsis:*    w[rite] [msglist] file

24269 Write the given messages to the file specified by the path name *file*, minus the message header.  
24270 Otherwise, it shall be equivalent to the **save** command.

24271 **Scroll Header Display**24272 *Synopsis:*      `z [+|-]`

24273 Scroll the header display forward (if '+' is specified or if no option is specified) or backward (if  
 24274 '-' is specified) one screenful. The number of headers written shall be set by the **screen**  
 24275 variable.

24276 **Invoke Shell Command**24277 *Synopsis:*      `!command`

24278 Invoke the command interpreter specified by *SHELL* with two arguments: `-c` and *command*.  
 24279 (See also *sh -c*.) If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall  
 24280 be replaced with the command executed by the previous ! command or ~! command escape.

24281 **Null Command**24282 *Synopsis:*      `# comment`24283 This null command (comment) shall be ignored by *mailx*.24284 **Display Current Message Number**24285 *Synopsis:*      `=`

24286 Write the current message number.

24287 **Command Escapes in mailx**

24288 The following commands can be entered only from input mode, by beginning a line with the  
 24289 escape character (by default, tilde ('~')). See the **escape** variable description for changing this  
 24290 special character. The format for the commands shall be:

24291 `<ESC><command-char><separator>[<arguments>]`24292 where the `<separator>` can be zero or more `<blank>` characters.

24293 In the following descriptions, the application shall ensure that the argument *command* (but not  
 24294 *mailx-command*) is a shell command string. Any string acceptable to the command interpreter  
 24295 specified by the *SHELL* variable when it is invoked as *SHELL -c command\_string* shall be valid.  
 24296 The command can be presented as multiple arguments (that is, quoting is not required).

24297 Command escapes that are listed with *msglist* or *mailx-command* arguments are invalid in Send  
 24298 Mode and produce unspecified results.

24299 ~! *command* Invoke the command interpreter specified by *SHELL* with two arguments: `-c` and  
 24300 *command*; and then return to input mode. If the **bang** variable is set, each  
 24301 unescaped occurrence of '!' in *command* shall be replaced with the command  
 24302 executed by the previous ! command or ~! command escape.

24303 ~. Simulate end-of-file (terminate message input).

24304 ~: *mailx-command*, ~\_ *mailx-command*  
 24305 Perform the command-level request.

24306 ~? Write a summary of command escapes.

24307 ~A This shall be equivalent to ~i **Sign**.24308 ~a This shall be equivalent to ~i **sign**.

|       |                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                          |

| 24352 |                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                          |

24353       ~x           Exit as with ~q, except the message shall not be saved in the dead-letter file.

24354       ~| *command* Pipe the body of the message through the given *command* by invoking the  
 24355           command interpreter specified by *SHELL* with two arguments: -c and *command*.  
 24356           If the *command* returns a successful exit status, the standard output of the  
 24357           command shall replace the message. Otherwise, the message shall remain  
 24358           unchanged. If the *command* fails, an error message giving the exit status shall be  
 24359           written.

24360 **EXIT STATUS**

24361       When the -e option is specified, the following exit values are returned:

24362       0   Mail was found.

24363       >0   Mail was not found or an error occurred.

24364       Otherwise, the following exit values are returned:

24365       0   Successful completion; note that this status implies that all messages were *sent*, but it gives  
 24366           no assurances that any of them were actually *delivered*.

24367       >0   An error occurred.

24368 **CONSEQUENCES OF ERRORS**

24369       When in input mode (Receive Mode) or Send Mode:

24370       • If an error is encountered processing a command escape (see **Command Escapes in mailx** on  
 24371         page 637), a diagnostic message shall be written to standard error, and the message being  
 24372         composed may be modified, but this condition shall not prevent the message from being  
 24373         sent.

24374       • Other errors shall prevent the sending of the message.

24375       When in command mode:

24376       • Default.

24377 **APPLICATION USAGE**

24378       Delivery of messages to remote systems requires the existence of communication paths to such  
 24379       systems. These need not exist.

24380       Input lines are limited to {LINE\_MAX} bytes, but mailers between systems may impose more  
 24381       severe line-length restrictions. This volume of IEEE Std. 1003.1-200x does not place any  
 24382       restrictions on the length of messages handled by *mailx*, and for delivery of local messages the  
 24383       only limitations should be the normal problems of available disk space for the target mail file.  
 24384       When sending messages to external machines, applications are advised to limit messages to less  
 24385       than 100 kilobytes because some mail gateways impose message-length restrictions.

24386       The format of the system mailbox is intentionally unspecified. Not all systems implement  
 24387       system mailboxes as flat files, particularly with the advent of multimedia mail messages. Some  
 24388       system mailboxes may be multiple files, others records in a database. The internal format of the  
 24389       messages themselves are specified with the historical format from Version 7, but only after they  
 24390       have been saved in some file other than the system mailbox. This was done so that many  
 24391       historical applications expecting text-file mailboxes are not broken.

24392       Some new formats for messages can be expected in the future, probably including binary data,  
 24393       bit maps, and various multimedia objects. As described here, *mailx* is not prohibited from  
 24394       handling such messages, but it must store them as text files in secondary mailboxes (unless  
 24395       some extension, such as a variable or command line option, is used to change the stored format).  
 24396       Its method of doing so is implementation-dependent and might include translating the data into

24397 text file-compatible or readable form or omitting certain portions of the message from the stored  
24398 output.

24399 The **discard** and **ignore** commands are not inverses of the **retain** command. The **retain**  
24400 command discards all header-fields except those explicitly retained. The **discard** command  
24401 keeps all header-fields except those explicitly discarded. If headers exist on the retained header  
24402 list, **discard** and **ignore** commands are ignored.

#### 24403 EXAMPLES

24404 None.

#### 24405 RATIONALE

24406 The standard developers felt strongly that a method for applications to send messages to  
24407 specific users was necessary. The obvious example is a batch utility, running non-interactively,  
24408 that wishes to communicate errors or results to a user. However, the actual format, delivery  
24409 mechanism, and method of reading the message are clearly beyond the scope of this volume of  
24410 IEEE Std. 1003.1-200x.

24411 The intent of this command is to provide a simple, portable interface for sending messages non-  
24412 interactively. It merely defines a “front-end” to the historical mail system. It is suggested that  
24413 implementations explicitly denote the sender and recipient in the body of the delivered message.  
24414 Further specification of formats for either the message envelope or the message itself were  
24415 deliberately not made, as the industry is in the midst of changing from the current standards to a  
24416 more internationalized standard and it is probably incorrect, at this time, to require either one.

24417 Implementations are encouraged to conform to the various delivery mechanisms described in  
24418 the CCITT X.400 standards or to the equivalent Internet standards, described in Internet Request  
24419 for Comment (RFC) documents RFC 819, RFC 822, RFC 920, RFC 921, and RFC 1123.

24420 Many historical systems modified each body line that started with **From** by prefixing the ‘F’  
24421 with ‘>’. It is unnecessary, but allowed, to do that when the string does not follow a blank line  
24422 because it cannot be confused with the next header.

24423 XSI-conformant systems support the following internal variable:

24424 **debug** Enable verbose diagnostics for debugging. Messages shall not be delivered. The  
24425 default shall be **nodebug**.

24426 The *edit* and *visual* commands merely edit the specified messages in a temporary file. They do  
24427 not modify the contents of those messages in the mailbox; such a capability could be added as an  
24428 extension, such as by using different command names.

24429 The restriction on a subject line being {LINE\_MAX}–10 bytes is based on the historical format  
24430 that consumes 10 bytes for **Subject:** and the trailing <newline>. Many historical mailers that a  
24431 message may encounter on other systems are not able to handle lines that long, however.

24432 Like the utilities *logger* and *lp*, *mailx* admittedly is difficult to test. This was not deemed sufficient  
24433 justification to exclude this utility from this volume of IEEE Std. 1003.1-200x. It is also arguable  
24434 that it is, in fact, testable, but that the tests themselves are not portable.

24435 When *mailx* is being used by an application that wishes to receive the results as if none of the  
24436 User Portability Utilities option features were supported, the *DEAD* environment variable must  
24437 be set to **/dev/null**. Otherwise, it may be subject to the file creations described in *mailx*  
24438 ASYNCHRONOUS EVENTS. Similarly, if the *MAILRC* environment variable is not set to  
24439 **/dev/null**, historical versions of *mailx* and *Mail* read initialization commands from a file before  
24440 processing begins. Since the initialization that a user specifies could alter the contents of  
24441 messages an application is trying to send, such applications must set *MAILRC* to **/dev/null**.

24442 The description of *LC\_TIME* uses “may affect” because many historical implementations do not  
24443 or cannot manipulate the date and time strings in the incoming mail headers. Some headers  
24444 found in incoming mail do not have enough information to determine the timezone in which the  
24445 mail originated, and, therefore, *mailx* cannot convert the date and time strings into the internal  
24446 form that then is parsed by routines like *strftime()* that can take *LC\_TIME* settings into account.  
24447 Changing all these times to a user-specified format is allowed, but not required.

24448 The paginator selected when *PAGER* is null or unset is partially unspecified to allow the System  
24449 V historical practice of using *pg* as the default. Bypassing the pagination function, such as by  
24450 declaring that *cat* is the paginator, would not meet with the intended meaning of this  
24451 description. However, any “portable user” would have to set *PAGER* explicitly to get his or her  
24452 preferred paginator on all systems. The paginator choice was made partially unspecified, unlike  
24453 the *VISUAL* editor choice (mandated to be *vi*) because most historical pagers follow a common  
24454 theme of user input, whereas editors differ dramatically.

24455 Options to specify addresses as **cc** (carbon copy) or **bcc** (blind carbon copy) were considered to  
24456 be format details and were omitted.

24457 A zero exit status implies that all messages were *sent*, but it gives no assurances that any of them  
24458 were actually *delivered*. The reliability of the delivery mechanism is unspecified and is an  
24459 appropriate marketing distinction between systems.

24460 In order to conform to the Utility Syntax Guidelines, a solution was required to the optional *file*  
24461 option-argument to **-f**. By making *file* an operand, the guidelines are satisfied and users remain  
24462 portable. However, it does force implementations to support usage such as:

24463 `mailx -fin mymail.box`

24464 The **no name** method of unsetting variables is not present in all historical systems, but it is in  
24465 System V and provides a logical set of commands corresponding to the format of the display of  
24466 options from the *mailx set* command without arguments.

24467 The **ask** and **asksub** variables are the names selected by BSD and System V, respectively, for the  
24468 same feature. They are synonyms in this volume of IEEE Std. 1003.1-200x.

24469 The *mailx echo* command was not documented in the BSD version and has been omitted here  
24470 because it is not obviously useful for interactive users.

24471 The default prompt on the System V *mailx* is a question mark, on BSD *Mail* an ampersand. Since  
24472 this volume of IEEE Std. 1003.1-200x chose the *mailx* name, it kept the System V default,  
24473 assuming that BSD users would not have difficulty with this minor incompatibility (that they  
24474 can override).

24475 The meanings of **r** and **R** are reversed between System V *mailx* and SunOS *Mail*. Once again,  
24476 since this volume of IEEE Std. 1003.1-200x chose the *mailx* name, it kept the System V default,  
24477 but allows the SunOS user to achieve the desired results using **flipr**, an internal variable in  
24478 System V *mailx*, although it has not been documented in the SVID

24479 The **indentprefix** variable, the **retain** and **unalias** commands, and the **~F** and **~M** command  
24480 escapes were adopted from 4.3 BSD *Mail*.

24481 The **version** command was not included because no sufficiently general specification of the  
24482 version information could be devised that would still be useful to a portable user. This  
24483 command name should be used by suppliers who wish to provide version information about the  
24484 *mailx* command.

24485 The “implementation-specific (unspecified) system start-up file” historically has been named  
24486 **/etc/mailx.rc**, but this specific name and location are not required.

24487 The intent of the wording for the **next** command is that if any command has already displayed  
 24488 the current message it should display a following message, but, otherwise, it should display the  
 24489 current message. Consider the command sequence:

```
24490 next 3
24491 delete 3
24492 next
```

24493 where the **autoprint** option was not set. The normative text specifies that the second **next**  
 24494 command should display a message following the third message, because even though the  
 24495 current message has not been displayed since it was set by the **delete** command, it has been  
 24496 displayed since the current message was anything other than message number 3. This does not  
 24497 always match historical practice in some implementations, where the command file address  
 24498 followed by **next** (or the default command) would skip the message for which the user had  
 24499 searched.

#### 24500 FUTURE DIRECTIONS

24501 None.

#### 24502 SEE ALSO

24503 *ed, ls, more, vi*

#### 24504 CHANGE HISTORY

24505 First released in Issue 2.

#### 24506 Issue 4

24507 Aligned with the ISO/IEC 9945-2: 1993 standard.

24508 This utility is now mandatory; it is optional in Issue 3.

#### 24509 Issue 5

24510 The description of the EDITOR environment variable is changed to indicate that *ed* is the default  
 24511 editor if this variable is not set. In previous issues, this default was not stated explicitly at this  
 24512 point but was implied further down in the text.

24513 FUTURE DIRECTIONS section added.

#### 24514 Issue 6

24515 The following new requirements on POSIX implementations derive from alignment with the  
 24516 Single UNIX Specification:

- 24517 • The **-F** option is added.
- 24518 • The **allnet**, **debug**, and **sendwait** internal variables are added.
- 24519 • The **C**, **ec**, **fo**, **F**, and **S** *mailx* commands are added.

24520 In the DESCRIPTION and ENVIRONMENT VARIABLES sections, text stating “*HOME*  
 24521 directory” is replaced by “directory referred to by the *HOME* environment variable”.

24522 The *mailx* utility is aligned with the IEEE P1003.2b draft standard, which included various  
 24523 clarifications to resolve PASC Interpretations submitted for the ISO POSIX-2: 1993 standard. In  
 24524 particular, the changes here address PASC Interpretations 1003.2-92 #10, 11, 103, 106, 108, 114,  
 24525 115, 122, and 129.

24526 The normative text is reworded to avoid use of the term “must” for application requirements.

24527 **NAME**24528       **make** — maintain, update, and regenerate groups of programs (**DEVELOPMENT**)24529 **SYNOPSIS**

```
24530 SD make [-einpqrst][-f makefile...] [-k | -S][macro=value]...
24531 [target_name...]
```

24532

24533 **DESCRIPTION**

24534       The *make* utility can be used as a part of software development to update files that are derived  
 24535       from other files. A typical case is one where object files are derived from the corresponding  
 24536       source files. The *make* utility examines time relationships and updates those derived files (called  
 24537       targets) that have modified times earlier than the modified times of the files (called  
 24538       prerequisites) from which they are derived. A description file (makefile) contains a description  
 24539       of the relationships between files, and the commands that the application shall execute to  
 24540       update the targets to reflect changes in their prerequisites. Each specification, or rule, shall  
 24541       consist of a target, optional prerequisites, and optional commands to be executed when a  
 24542       prerequisite is newer than the target. There are two types of rule:

24543           1. *Inference rules*, which have one target name with at least one period ( ' . ' ) and no slash  
 24544            ( ' / ' )

24545           2. *Target rules*, which can have more than one target name

24546       In addition, *make* shall have a collection of built-in macros and inference rules that infer  
 24547       prerequisite relationships to simplify maintenance of programs.

24548       To receive exactly the behavior described in this section, the user shall ensure that a portable  
 24549       makefile:

- 24550       • Includes the special target **.POSIX**
- 24551       • Omits any special target reserved for implementations (a leading period followed by  
 24552        uppercase letters) that has not been specified by this section

24553       The behavior of *make* is unspecified if either or both of these conditions are not met.

24554 **OPTIONS**

24555       The *make* utility shall conform to the System Interface Definitions volume of  
 24556       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

24557       The following options shall be supported:

24558       **-e**           Cause environment variables, including those with null values, to override macro  
 24559       assignments within makefiles.

24560       **-f *makefile***   Specify a different makefile. The argument *makefile* is a path name of a description  
 24561       file, which is also referred to as the *makefile*. A path name of ' - ' shall denote the  
 24562       standard input. There can be multiple instances of this option, and they shall be  
 24563       processed in the order specified. The effect of specifying the same option-  
 24564       argument more than once is unspecified.

24565       **-i**           Ignore error codes returned by invoked commands. This mode is the same as if the  
 24566       special target **.IGNORE** were specified without prerequisites.

24567       **-k**           Continue to update other targets that do not depend on the current target if a non-  
 24568       ignored error occurs while executing the commands to bring a target up-to-date.

24569       **-n**           Write commands that would be executed on standard output, but do not execute  
 24570       them. However, lines with a plus sign ( ' + ' ) prefix shall be executed. In this mode,

24571 lines with an at sign ('@') character prefix shall be written to standard output.

24572       **-p**       Write to standard output the complete set of macro definitions and target  
24573       descriptions. The output format is unspecified.

24574       **-q**       Return a zero exit value if the target file is up-to-date; otherwise, return an exit  
24575       value of 1. Targets shall not be updated if this option is specified. However, a  
24576       makefile command line (associated with the targets) with a plus sign ('+') prefix  
24577       shall be executed.

24578       **-r**       Clear the suffix list and does not use the built-in rules.

24579       **-S**       Terminate *make* if an error occurs while executing the commands to bring a target  
24580       up-to-date. This shall be the default and the opposite of **-k**.

24581       **-s**       Do not write makefile command lines or touch messages (see **-t**) to standard  
24582       output before executing. This mode shall be the same as if the special target  
24583       **.SILENT** were specified without prerequisites.

24584       **-t**       Update the modification time of each target as though a *touch target* had been  
24585       executed. Targets that have prerequisites but no commands (see **Target Rules** on  
24586       page 647), or that are already up-to-date, shall not be touched in this manner.  
24587       Write messages to standard output for each target file indicating the name of the  
24588       file and that it was touched. Normally, the makefile command lines associated  
24589       with each target are not executed. However, a command line with a plus sign  
24590       ('+') prefix shall be executed.

24591       Any options specified in the *MAKEFLAGS* environment variable shall be evaluated before any  
24592       options specified on the *make* utility command line. If the **-k** and **-S** options are both specified  
24593       on the *make* utility command line or by the *MAKEFLAGS* environment variable, the last option  
24594       specified shall take precedence. If the **-f** or **-p** options appear in the *MAKEFLAGS* environment  
24595       variable, the result is undefined.

## 24596 OPERANDS

24597       The following operands shall be supported:

24598       *target\_name*   Target names, as defined in the EXTENDED DESCRIPTION section. If no target is  
24599       specified, while *make* is processing the makefiles, the first target that *make*  
24600       encounters that is not a special target or an inference rule shall be used.

24601       *macro=value*   Macro definitions, as defined in **Macros** on page 649.

24602       If the *target\_name* and *macro=value* operands are intermixed on the *make* utility command line,  
24603       the results are unspecified.

## 24604 STDIN

24605       The standard input shall be used only if the *makefile* option-argument is '-'. See the INPUT  
24606       FILES section.

## 24607 INPUT FILES

24608       The input file, otherwise known as the makefile, is a text file containing rules, macro definitions,  
24609       and comments.

## 24610 ENVIRONMENT VARIABLES

24611       The following environment variables shall affect the execution of *make*:

24612       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
24613       If *LANG* is unset or null, the corresponding value from the implementation-  
24614       dependent default locale shall be used. If any of the internationalization variables  
24615       contains an invalid setting, the utility shall behave as if none of the variables had

|       |                    |                                                                                                      |
|-------|--------------------|------------------------------------------------------------------------------------------------------|
| 24616 |                    | been defined.                                                                                        |
| 24617 | <i>LC_ALL</i>      | If set to a non-empty string value, override the values of all the other                             |
| 24618 |                    | internationalization variables.                                                                      |
| 24619 | <i>LC_CTYPE</i>    | Determine the locale for the interpretation of sequences of bytes of text data as                    |
| 24620 |                    | characters (for example, single-byte as opposed to multi-byte characters in                          |
| 24621 |                    | arguments and input files).                                                                          |
| 24622 | <i>LC_MESSAGES</i> |                                                                                                      |
| 24623 |                    | Determine the locale that should be used to affect the format and contents of                        |
| 24624 |                    | diagnostic messages written to standard error.                                                       |
| 24625 | <i>MAKEFLAGS</i>   |                                                                                                      |
| 24626 |                    | This variable shall be interpreted as a character string representing a series of                    |
| 24627 |                    | option characters to be used as the default options. The implementation shall                        |
| 24628 |                    | accept both of the following formats (but need not accept them when intermixed):                     |
| 24629 |                    | • The characters are option letters without the leading hyphens or <blank>                           |
| 24630 |                    | character separation used on a <i>make</i> utility command line.                                     |
| 24631 |                    | • The characters are formatted in a manner similar to a portion of the <i>make</i> utility           |
| 24632 |                    | command line: options are preceded by hyphens and <blank> character-                                 |
| 24633 |                    | separated as described in the System Interface Definitions volume of                                 |
| 24634 |                    | IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines. The <i>macro=value</i>               |
| 24635 |                    | macro definition operands can also be included. The difference between the                           |
| 24636 |                    | contents of <i>MAKEFLAGS</i> and the <i>make</i> utility command line is that the contents           |
| 24637 |                    | of the variable shall not be subjected to the word expansions (see Section 2.6 on                    |
| 24638 |                    | page 49) associated with parsing the command line values.                                            |
| 24639 |                    | The value of the <i>SHELL</i> environment variable shall not be used as a macro and                  |
| 24640 |                    | shall not be modified by defining the <i>SHELL</i> macro in a makefile or on the <i>make</i>         |
| 24641 |                    | utility command line. All other environment variables, including those with null                     |
| 24642 |                    | values, shall be used as macros.                                                                     |
| 24643 | XSI                | <i>NLSPATH</i> Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> . |
| 24644 | XSI                | <i>PROJECTDIR</i>                                                                                    |
| 24645 |                    | Provide a directory to be used to search for SCCS files not found in the current                     |
| 24646 |                    | directory. In all of the following cases, the search for SCCS files is made in the                   |
| 24647 |                    | directory <b>SCCS</b> in the identified directory. If the value of <i>PROJECTDIR</i> begins          |
| 24648 |                    | with a slash, it shall be considered an absolute path name; otherwise, the value of                  |
| 24649 |                    | <i>PROJECTDIR</i> is treated as a user name and that user's initial working directory                |
| 24650 |                    | shall be examined for a subdirectory <b>src</b> or <b>source</b> . If such a directory is found, it  |
| 24651 |                    | shall be used. Otherwise, the value is used as a relative path name.                                 |
| 24652 |                    | If <i>PROJECTDIR</i> is not set or has a null value, the search for SCCS files shall be              |
| 24653 |                    | made in the directory <b>SCCS</b> in the current directory.                                          |
| 24654 |                    | The setting of <i>PROJECTDIR</i> affects all files listed in the remainder of this utility           |
| 24655 |                    | description for files with a component named <b>SCCS</b> .                                           |
| 24656 |                    | The value of the <i>SHELL</i> environment variable shall not be used as a macro and shall not be     |
| 24657 |                    | modified by defining the <b>SHELL</b> macro in a makefile or on the command line. All other          |
| 24658 |                    | environment variables, including those with null values, shall be used as macros, as defined in      |
| 24659 |                    | <b>Macros</b> on page 649.                                                                           |

24660 **ASYNCHRONOUS EVENTS**

24661 If not already ignored, *make* shall trap SIGHUP, SIGTERM, SIGINT, and SIGQUIT and remove  
 24662 the current target unless the target is a directory or the target is a prerequisite of the special  
 24663 target **.PRECIOUS** or unless one of the **-n**, **-p**, or **-q** options was specified. Any targets removed  
 24664 in this manner shall be reported in diagnostic messages of unspecified format, written to  
 24665 standard error. After this cleanup process, if any, *make* shall take the standard action for all other  
 24666 signals.

24667 **STDOUT**

24668 The *make* utility shall write all commands to be executed to standard output unless the **-s** option  
 24669 was specified, the command is prefixed with an at sign, or the special target **.SILENT** has either  
 24670 the current target as a prerequisite or has no prerequisites. If *make* is invoked without any work  
 24671 needing to be done, it shall write a message to standard output indicating that no action was  
 24672 taken. If the **-t** option is present and a file is touched, *make* shall write to standard output a  
 24673 message of unspecified format indicating that the file was touched, including the file name of  
 24674 the file.

24675 **STDERR**

24676 Used only for diagnostic messages.

24677 **OUTPUT FILES**

24678 Files can be created when the **-t** option is present. Additional files can also be created by the  
 24679 utilities invoked by *make*.

24680 **EXTENDED DESCRIPTION**

24681 The *make* utility attempts to perform the actions required to ensure that the specified targets are  
 24682 up-to-date. A target is considered out-of-date if it is older than any of its prerequisites or if it  
 24683 does not exist. The *make* utility shall treat all prerequisites as targets themselves and recursively  
 24684 ensure that they are up-to-date, processing them in the order in which they appear in the rule.  
 24685 The *make* utility shall use the modification times of files to determine whether the corresponding  
 24686 targets are out-of-date.

24687 After *make* has ensured that all of the prerequisites of a target are up-to-date and if the target is  
 24688 out-of-date, the commands associated with the target entry shall be executed. If there are no  
 24689 commands listed for the target, the target shall be treated as up-to-date.

24690 **Makefile Syntax**

24691 A makefile can contain rules, macro definitions (see **Macros** on page 649), and comments. There  
 24692 are two kinds of rules: *inference rules* and *target rules*. The *make* utility shall contain a set of  
 24693 built-in inference rules. If the **-r** option is present, the built-in rules shall not be used and the  
 24694 suffix list shall be cleared. Additional rules of both types can be specified in a makefile. If a rule  
 24695 is defined more than once, the value of the rule shall be that of the last one specified. Macros can  
 24696 also be defined more than once, and the value of the macro is specified in **Macros** on page 649.  
 24697 Comments start with a number sign (**#**) and continue until an unescaped <newline> character  
 24698 is reached.

24699 XSI By default, the following files shall be tried in sequence: **./makefile**, **./Makefile**, **./s.makefile**,  
 24700 **SCCS/s.makefile**, **./s.Makefile**, and **SCCS/s.Makefile**.

24701 The **-f** option shall direct *make* to ignore any of these default files and use the specified argument  
 24702 as a makefile instead. If the **-** argument is specified, standard input shall be used.

24703 The term *makefile* is used to refer to any rules provided by the user, whether in **./makefile** or its  
 24704 variants, or specified by the **-f** option.

24705 The rules in makefiles shall consist of the following types of lines: target rules, including special  
 24706 targets (see **Target Rules**), inference rules (see **Inference Rules** on page 650), macro definitions  
 24707 (see **Macros** on page 649), empty lines, and comments. Comments start with a number sign  
 24708 (`'#'`) and continue until an unescaped `<newline>` character is reached.

24709 When an escaped `<newline>` (one preceded by a backslash) is found anywhere in the makefile  
 24710 except in a command line, it shall be replaced, along with any leading white space on the  
 24711 following line, with a single `<space>`. When an escaped `<newline>` is found in a command line  
 24712 in a makefile, the command line shall contain the backslash, the `<newline>`, and the next line,  
 24713 except that the first character of the next line shall not be included if it is a `<tab>`.

## 24714 **Makefile Execution**

24715 Makefile command lines shall be processed one at a time by writing the makefile command line  
 24716 to the standard output (unless one of the conditions listed under `'@'` suppresses the writing)  
 24717 and executing the command(s) in the line. A `<tab>` character may precede the command to  
 24718 standard output. Command execution shall be as if the makefile command line were the  
 24719 argument to the `system()` function. The environment for the command being executed shall  
 24720 contain all of the variables in the environment of *make*.

24721 By default, when *make* receives a non-zero status from the execution of a command, it terminates  
 24722 with an error message to standard error.

24723 Makefile command lines can have one or more of the following prefixes: a hyphen (`'-'`), an at  
 24724 sign (`'@'`), or a plus sign (`'+'`). These modify the way in which *make* processes the command.  
 24725 When a command is written to standard output, the prefix shall not be included in the output.

24726 – If the command prefix contains a hyphen, or the `-i` option is present, or the special target  
 24727 `.IGNORE` has either the current target as a prerequisite or has no prerequisites, any error  
 24728 found while executing the command shall be ignored.

24729 @ If the command prefix contains an at sign and the *make* utility command line `-n` option is  
 24730 not specified, or the `-s` option is present, or the special target `.SILENT` has either the current  
 24731 target as a prerequisite or has no prerequisites, the command shall not be written to  
 24732 standard output before it is executed.

24733 + If the command prefix contains a plus sign, this indicates a makefile command line that  
 24734 shall be executed even if `-n`, `-q`, or `-t` is specified.

## 24735 **Target Rules**

24736 Target rules are formatted as follows:

```
24737 target [target...]: [prerequisite...][;command]
24738 [<tab>command
24739 <tab>command
24740 ...]
```

24741 *line that does not begin with `<tab>`*

24742 Target entries are specified by a `<blank>` character-separated, non-null list of targets, then a  
 24743 colon, then a `<blank>` character-separated, possibly empty list of prerequisites. Text following a  
 24744 semicolon, if any, and all following lines that begin with a `<tab>` character, are makefile  
 24745 command lines to be executed to update the target. The first non-empty line that does not begin  
 24746 with a `<tab>` character or `'#'` shall begin a new entry. An empty or blank line, or a line  
 24747 beginning with `'#'`, may begin a new entry.

24748 Applications shall select target names from the set of characters consisting solely of periods,  
 24749 underscores, digits, and alphabets from the portable character set (see the System Interface  
 24750 Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable Character Set).  
 24751 Implementations may allow other characters in target names as extensions. The interpretation of  
 24752 targets containing the characters '%' and ' ' is implementation-dependent.

24753 A target that has prerequisites, but does not have any commands, can be used to add to the  
 24754 prerequisite list for that target. Only one target rule for any given target can contain commands.

24755 Lines that begin with one of the following are called *special targets* and control the operation of  
 24756 *make*:

24757 **.DEFAULT** If the makefile uses this special target, the application shall ensure that it is  
 24758 specified with commands, but without prerequisites. The commands shall be used  
 24759 by *make* if there are no other rules available to build a target.

24760 **.IGNORE** Prerequisites of this special target are targets themselves; this shall cause errors  
 24761 from commands associated with them to be ignored in the same manner as  
 24762 specified by the **-i** option. Subsequent occurrences of **.IGNORE** shall add to the  
 24763 list of targets ignoring command errors. If no prerequisites are specified, *make* shall  
 24764 behave as if the **-i** option had been specified and errors from all commands  
 24765 associated with all targets shall be ignored.

24766 **.POSIX** The application shall ensure that this special target is specified without  
 24767 prerequisites or commands. If it appears before the first non-comment line in the  
 24768 makefile, *make* shall process the makefile as specified by this section; otherwise, the  
 24769 behavior of *make* is unspecified.

24770 **.PRECIOUS** Prerequisites of this special target shall not be removed if *make* receives one of the  
 24771 asynchronous events explicitly described in the ASYNCHRONOUS EVENTS  
 24772 section. Subsequent occurrences of **.PRECIOUS** shall add to the list of precious  
 24773 files. If no prerequisites are specified, all targets in the makefile shall be treated as  
 24774 if specified with **.PRECIOUS**.

24775 XSI **.SCCS\_GET** The application shall ensure that this special target is specified without  
 24776 prerequisites. If this special target is included in a makefile, the commands  
 24777 specified with this target shall replace the default commands associated with this  
 24778 special target (see **Default Rules** on page 653). The commands specified with this  
 24779 target are used to get all SCCS files that are not found in the current directory.

24780 When source files are named in a dependency list, *make* treats them just like any  
 24781 other target. Because the source file is presumed to be present in the directory,  
 24782 there is no need to add an entry for it to the makefile. When a target has no  
 24783 dependencies, but is present in the directory, *make* assumes that that file is up-to-  
 24784 date. If, however, an SCCS file named **SCCS/s.source\_file** is found for a target  
 24785 *source\_file*, *make* does some additional checking to assure that the target is up-to-  
 24786 date. If the target is missing, or if the SCCS file is newer, *make* automatically issues  
 24787 the commands specified for the **.SCCS\_GET** special target to retrieve the most  
 24788 recent version. However, if the target is writable by anyone, *make* does not retrieve  
 24789 a new version.

24790 **.SILENT** Prerequisites of this special target are targets themselves; this shall cause  
 24791 commands associated with them to not be written to the standard output before  
 24792 they are executed. Subsequent occurrences of **.SILENT** shall add to the list of  
 24793 targets with silent commands. If no prerequisites are specified, *make* shall behave  
 24794 as if the **-s** option had been specified and no commands or touch messages  
 24795 associated with any target shall be written to standard output.

24796 **.SUFFIXES** Prerequisites of **.SUFFIXES** shall be appended to the list of known suffixes and are  
 24797 used in conjunction with the inference rules (see **Inference Rules** on page 650). If  
 24798 **.SUFFIXES** does not have any prerequisites, the list of known suffixes shall be  
 24799 cleared.

24800 The special targets **.IGNORE**, **.POSIX**, **.PRECIOUS**, **.SILENT**, and **.SUFFIXES** shall be specified  
 24801 without commands.

24802 Targets with names consisting of a leading period followed by the uppercase letters "POSIX"  
 24803 and then any other characters are reserved for future standardization. Targets with names  
 24804 consisting of a leading period followed by one or more uppercase letters are reserved for  
 24805 implementation extensions.

## 24806 **Macros**

24807 Macro definitions are in the form:

24808 *string1* = [*string2*]

24809 The macro named *string1* is defined as having the value of *string2*, where *string2* is defined as all  
 24810 characters, if any, after the equal sign, up to a comment character ('#') or an unescaped  
 24811 <newline> character. Any <blank> characters immediately before or after the equal sign shall be  
 24812 ignored.

24813 Applications shall select macro names from the set of characters consisting solely of periods,  
 24814 underscores, digits, and alphabets from the portable character set (see the System Interface  
 24815 Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable Character Set). A macro name  
 24816 shall not contain an equals sign. Implementations may allow other characters in macro names  
 24817 as extensions.

24818 Macros can appear anywhere in the makefile.  $\$(string1)$  or  $\${string1}$  shall be replaced by  
 24819 *string2*, as follows:

- 24820 • Macros in target lines shall be evaluated when the target line is read.
- 24821 • Macros in makefile command lines shall be evaluated when the command is executed.
- 24822 • Macros in the string before the equals sign in a macro definition shall be evaluated when the  
 24823 macro assignment is made.
- 24824 • Macros after the equals sign in a macro definition shall not be evaluated until the defined  
 24825 macro is used in a rule or command, or before the equals sign in a macro definition.

24826 The parentheses or braces are optional if *string1* is a single character. The macro **\$\$** shall be  
 24827 replaced by the single character '\$'.

24828 The forms  $\$(string1[:subst1=[subst2]])$  or  $\${string1[:subst1=[subst2]]}$  can be used to replace all  
 24829 occurrences of *subst1* with *subst2* when the macro substitution is performed. The *subst1* to be  
 24830 replaced shall be recognized when it is a suffix at the end of a word in *string1* (where a *word*, in  
 24831 this context, is defined to be a string delimited by the beginning of the line, a <blank> or  
 24832 <newline> character).

24833 Macro definitions shall be taken from the following sources, in the following logical order,  
 24834 before the makefile(s) are read.

- 24835 1. Macros specified on the *make* utility command line, in the order specified on the command  
 24836 line. It is unspecified whether the internal macros defined in **Internal Macros** on page 652  
 24837 are accepted from this source.

2. Macros defined by the *MAKEFLAGS* environment variable, in the order specified in the environment variable. It is unspecified whether the internal macros defined in **Internal Macros** on page 652 are accepted from this source.
3. The contents of the environment, excluding the *MAKEFLAGS* and *SHELL* variables and including the variables with null values.
4. Macros defined in the inference rules built into *make*.

Macro definitions from these sources shall not override macro definitions from a lower-numbered source. Macro definitions from a single source (for example, the *make* utility command line, the *MAKEFLAGS* environment variable, or the other environment variables) shall override previous macro definitions from the same source.

Macros defined in the makefile(s) shall override macro definitions that occur before them in the makefile(s) and macro definitions from source 4. If the *-e* option is not specified, macros defined in the makefile(s) shall override macro definitions from source 3. Macros defined in the makefile(s) shall not override macro definitions from source 1. or source 2.

Before the makefile(s) are read, all of the *make* utility command line options (except *-f* and *-p*) and *make* utility command line macro definitions (except any for the *MAKEFLAGS* macro), not already included in the *MAKEFLAGS* macro, shall be added to the *MAKEFLAGS* macro. Other implementation-dependent options and macros may also be added to the *MAKEFLAGS* macro. If this modifies the value of the *MAKEFLAGS* macro, or, if the *MAKEFLAGS* macro is modified at any subsequent time, the *MAKEFLAGS* environment variable shall be modified to match the new value of the *MAKEFLAGS* macro.

Before the makefile(s) are read, all of the *make* utility command line macro definitions (except the *MAKEFLAGS* macro or the *SHELL* macro) shall be added to the environment of *make*. Other implementation-dependent variables may also be added to the environment of *make*.

The **SHELL** macro shall be treated specially. It shall be provided by *make* and set to the path name of the shell command language interpreter (see *sh* on page 888). The *SHELL* environment variable shall not affect the value of the **SHELL** macro. If **SHELL** is defined in the makefile or is specified on the command line, it shall replace the original value of the **SHELL** macro, but shall not affect the *SHELL* environment variable. Other effects of defining **SHELL** in the makefile or on the command line are implementation-dependent.

## Inference Rules

Inference rules are formatted as follows:

```
target:
<tab>command
[<tab>command]
...

line that does not begin with <tab> or #
```

The application shall ensure that the *target* portion is a valid target name (see **Target Rules** on page 647) of the form *.s2* or *.s1.s2* (where *.s1* and *.s2* are suffixes that have been given as prerequisites of the **.SUFFIXES** special target and *s1* and *s2* do not contain any slashes or periods.) If there is only one period in the target, it is a single-suffix inference rule. Targets with two periods are double-suffix inference rules. Inference rules can have only one target before the colon.

The application shall ensure that the makefile does not specify prerequisites for inference rules; no characters other than white space shall follow the colon in the first line, except when creating

24883 the *empty rule*, described below. Prerequisites are inferred, as described below.

24884 Inference rules can be redefined. A target that matches an existing inference rule shall overwrite  
 24885 the old inference rule. An empty rule can be created with a command consisting of simply a  
 24886 semicolon (that is, the rule still exists and is found during inference rule search, but since it is  
 24887 empty, execution has no effect). The empty rule also can be formatted as follows:

24888 `rule: ;`

24889 where zero or more <blank> characters separate the colon and semicolon.

24890 The *make* utility uses the suffixes of targets and their prerequisites to infer how a target can be  
 24891 made up-to-date. A list of inference rules defines the commands to be executed. By default, *make*  
 24892 contains a built-in set of inference rules. Additional rules can be specified in the makefile.

24893 The special target **.SUFFIXES** contains as its prerequisites a list of suffixes that shall be used by  
 24894 the inference rules. The order in which the suffixes are specified defines the order in which the  
 24895 inference rules for the suffixes are used. New suffixes shall be appended to the current list by  
 24896 specifying a **.SUFFIXES** special target in the makefile. A **.SUFFIXES** target with no prerequisites  
 24897 shall clear the list of suffixes. An empty **.SUFFIXES** target followed by a new **.SUFFIXES** list is  
 24898 required to change the order of the suffixes.

24899 Normally, the user would provide an inference rule for each suffix. The inference rule to update  
 24900 a target with a suffix **.s1** from a prerequisite with a suffix **.s2** is specified as a target **.s2.s1**. The  
 24901 internal macros provide the means to specify general inference rules (see **Internal Macros** on  
 24902 page 652).

24903 When no target rule is found to update a target, the inference rules shall be checked. The suffix  
 24904 of the target (**.s1**) to be built is compared to the list of suffixes specified by the **.SUFFIXES** special  
 24905 targets. If the **.s1** suffix is found in **.SUFFIXES**, the inference rules shall be searched in the order  
 24906 defined for the first **.s2.s1** rule whose prerequisite file (**\$\*.s2**) exists. If the target is out-of-date  
 24907 with respect to this prerequisite, the commands for that inference rule shall be executed.

24908 If the target to be built does not contain a suffix and there is no rule for the target, the single  
 24909 suffix inference rules shall be checked. The single-suffix inference rules define how to build a  
 24910 target if a file is found with a name that matches the target name with one of the single suffixes  
 24911 appended. A rule with one suffix **.s2** is the definition of how to build *target* from **target.s2**. The  
 24912 other suffix (**.s1**) is treated as null.

24913 XSI A tilde ('~') in the above rules refers to an SCCS file in the current directory. Thus, the rule **.c~.o**  
 24914 would transform an SCCS C-language source file into an object file (**.o**). Because the **s.** of the  
 24915 SCCS files is a prefix, it is incompatible with *make*'s suffix point of view. Hence, the '~' is a way  
 24916 of changing any file reference into an SCCS file reference.

24917 **Libraries**

24918 If a target or prerequisite contains parentheses, it shall be treated as a member of an archive  
 24919 library. For the *lib(member.o)* expression *lib* refers to the name of the archive library and *member.o*  
 24920 to the member name. The application shall ensure that the member is an object file with the **.o**  
 24921 suffix. The modification time of the expression is the modification time for the member as kept  
 24922 in the archive library; see *ar* on page 168. The **.a** suffix refers to an archive library. The **.s2.a** rule  
 24923 is used to update a member in the library from a file with a suffix **.s2**.

24924      **Internal Macros**

24925      The *make* utility shall maintain five internal macros that can be used in target and inference rules.  
 24926      In order to clearly define the meaning of these macros, some clarification of the terms *target rule*,  
 24927      *inference rule*, *target*, and *prerequisite* is necessary.

24928      Target rules are specified by the user in a makefile for a particular target. Inference rules are  
 24929      user-specified or *make*-specified rules for a particular class of target name. Explicit prerequisites  
 24930      are those prerequisites specified in a makefile on target lines. Implicit prerequisites are those  
 24931      prerequisites that are generated when inference rules are used. Inference rules are applied to  
 24932      implicit prerequisites or to explicit prerequisites that do not have target rules defined for them in  
 24933      the makefile. Target rules are applied to targets specified in the makefile.

24934      Before any target in the makefile is updated, each of its prerequisites (both explicit and implicit)  
 24935      shall be updated. This shall be accomplished by recursively processing each prerequisite. Upon  
 24936      recursion, each prerequisite shall become a target itself. Its prerequisites in turn shall be  
 24937      processed recursively until a target is found that has no prerequisites, at which point the  
 24938      recursion stops. The recursion then shall back up, updating each target as it goes.

24939      In the definitions that follow, the word *target* refers to one of:

- 24940      • A target specified in the makefile
- 24941      • An explicit prerequisite specified in the makefile that becomes the target when *make*  
 24942      processes it during recursion
- 24943      • An implicit prerequisite that becomes a target when *make* processes it during recursion

24944      In the definitions that follow, the word *prerequisite* refers to one of the following:

- 24945      • An explicit prerequisite specified in the makefile for a particular target
- 24946      • An implicit prerequisite generated as a result of locating an appropriate inference rule and  
 24947      corresponding file that matches the suffix of the target

24948      The five internal macros are:

24949      **\$@**      The **\$@** shall evaluate to the full target name of the current target, or the archive file  
 24950      name part of a library archive target. It shall be evaluated for both target and inference  
 24951      rules.

24952      For example, in the **.c.a** inference rule, **\$@** represents the out-of-date **.a** file to be built.  
 24953      Similarly, in a makefile target rule to build **lib.a** from **file.c**, **\$@** represents the out-of-  
 24954      date **lib.a**.

24955      **\$%**      The **\$%** macro shall be evaluated only when the current target is an archive library  
 24956      member of the form *libname(member.o)*. In these cases, **\$@** shall evaluate to *libname* and  
 24957      **\$%** shall evaluates to *member.o*. The **\$%** macro shall be evaluated for both target and  
 24958      inference rules.

24959      For example, in a makefile target rule to build **lib.a(file.o)**, **\$%** represents **file.o**, as  
 24960      opposed to **\$@**, which represents **lib.a**.

24961      **\$?**      The **\$?** macro shall evaluate to the list of prerequisites that are newer than the current  
 24962      target. It shall be evaluated for both target and inference rules.

24963      For example, in a makefile target rule to build *prog* from **file1.o**, **file2.o**, and **file3.o**, and  
 24964      where *prog* is not out of date with respect to **file1.o**, but is out of date with respect to  
 24965      **file2.o** and **file3.o**, **\$?** represents **file2.o** and **file3.o**.

24966       \$<       In an inference rule, the \$< macro shall evaluate to the file name whose existence  
 24967               allowed the inference rule to be chosen for the target. In the **.DEFAULT** rule, the \$<  
 24968               macro shall evaluate to the current target name. The meaning of the \$< macro is  
 24969               otherwise unspecified.

24970               For example, in the **.c.a** inference rule, \$< represents the prerequisite **.c** file.

24971       \$\*       The \$\* macro shall evaluate to the current target name with its suffix deleted. It shall be  
 24972               evaluated at least for inference rules.

24973               For example, in the **.c.a** inference rule, \$\*.o represents the out-of-date **.o** file that  
 24974               corresponds to the prerequisite **.c** file.

24975       Each of the internal macros has an alternative form. When an uppercase 'D' or 'F' is appended  
 24976       to any of the macros, the meaning is changed to the *directory part* for 'D' and *file name part* for  
 24977       'F'. The directory part is the path prefix of the file without a trailing slash; for the current  
 24978       directory, the directory part is ' '. When the \$? macro contains more than one prerequisite file  
 24979       name, the \$(?D) and \$(?F) (or \${?D} and \${?F}) macros expand to a list of directory name parts  
 24980       and file name parts respectively.

24981       For the target *lib(member.o)* and the **s2.a** rule, the internal macros are defined as:

24982       \$<       *member.s2*

24983       \$\*       *member*

24984       \$@       *lib*

24985       \$?       *member.s2*

24986       \$%       *member.o*

## 24987       Default Rules

24988       The default rules for *make* shall achieve results that are the same as if the following were used.  
 24989       Implementations that do not support the C-Language Development Utilities option may omit  
 24990       **CC**, **CFLAGS**, **YACC**, **YFLAGS**, **LEX**, **LFLAGS**, **LDFLAGS**, and the **.c**, **.y**, and **.l** inference rules.  
 24991       Implementations that do not support FORTRAN may omit **FC**, **FFLAGS**, and the **.f** inference  
 24992       rules. Implementations may provide additional macros and rules.

## 24993       SPECIAL TARGETS

24994 XSI       .SCCS\_GET: sccs \$(SCCSFLAGS) get \$(SCCSGETFLAGS) \$@

24995

24996 XSI       .SUFFIXES: .o .c .y .l .a .sh .f .c~ .y~ .l~ .sh~ .f~

## 24997       MACROS

24998       MAKE=make

24999       AR=ar

25000       ARFLAGS=-rv

25001       YACC=yacc

25002       YFLAGS=

25003       LEX=lex

25004       LFLAGS=

25005       LDFLAGS=

25006       CC=c89

25007       CFLAGS=-O

25008       FC=fort77

```

25009 FFLAGS=-O 1
25010 XSI GET=get
25011 GFLAGS=
25012 SCCSFLAGS=
25013 SCCSGETFLAGS=-s
25014

```

#### 25015 *SINGLE SUFFIX RULES*

```

25016 .c:
25017 $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $<
25018 .f:
25019 $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $<
25020 .sh:
25021 cp $< $@
25022 chmod a+x $@

```

```

25023 XSI .c~:
25024 $(GET) $(GFLAGS) -p $< > $*.c
25025 $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $*.c

```

```

25026 .f~:
25027 $(GET) $(GFLAGS) -p $< > $*.f
25028 $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $*.f

```

```

25029 .sh~:
25030 $(GET) $(GFLAGS) -p $< > $*.sh
25031 cp $*.sh $@
25032 chmod a+x $@
25033

```

#### 25034 *DOUBLE SUFFIX RULES*

```

25035 .c.o:
25036 $(CC) $(CFLAGS) -c $<

```

```

25037 .f.o:
25038 $(FC) $(FFLAGS) -c $<

```

```

25039 .y.o:
25040 $(YACC) $(YFLAGS) $<
25041 $(CC) $(CFLAGS) -c y.tab.c
25042 rm -f y.tab.c
25043 mv y.tab.o $@

```

```

25044 .l.o:
25045 $(LEX) $(LFLAGS) $<
25046 $(CC) $(CFLAGS) -c lex.yy.c
25047 rm -f lex.yy.c
25048 mv lex.yy.o $@

```

```

25049 .y.c:
25050 $(YACC) $(YFLAGS) $<
25051 mv y.tab.c $@

```

```

25052 .l.c:
25053 $(LEX) $(LFLAGS) $<

```

```

25054 mv lex.yy.c $@
25055 xsi .c~.o:
25056 $(GET) $(GFLAGS) -p $< > $*.c
25057 $(CC) $(CFLAGS) -c $*.c
25058
25059 .f~.o:
25059 $(GET) $(GFLAGS) -p $< > $*.f
25060 $(FC) $(FFLAGS) -c $*.f
25061
25062 .y~.o:
25062 $(GET) $(GFLAGS) -p $< > $*.y
25063 $(YACC) $(YFLAGS) $*.y
25064 $(CC) $(CFLAGS) -c y.tab.c
25065 rm -f y.tab.c
25066 mv y.tab.o $@
25067
25068 .l~.o:
25068 $(GET) $(GFLAGS) -p $< > $*.l
25069 $(LEX) $(LFLAGS) $*.l
25070 $(CC) $(CFLAGS) -c lex.yy.c
25071 rm -f lex.yy.c
25072 mv lex.yy.o $@
25073
25074 .y~.c:
25074 $(GET) $(GFLAGS) -p $< > $*.y
25075 $(YACC) $(YFLAGS) $*.y
25076 mv y.tab.c $@
25077
25078 .l~.c:
25078 $(GET) $(GFLAGS) -p $< > $*.l
25079 $(LEX) $(LFLAGS) $*.l
25080 mv lex.yy.c $@
25081
25082 .c.a:
25083 $(CC) -c $(CFLAGS) $<
25084 $(AR) $(ARFLAGS) $@ $*.o
25085 rm -f $*.o
25086
25087 .f.a:
25087 $(FC) -c $(FFLAGS) $<
25088 $(AR) $(ARFLAGS) $@ $*.o
25089 rm -f $*.o
25090 EXIT STATUS
25091 When the -q option is specified, the make utility shall exit with one of the following values:
25092 0 Successful completion.
25093 1 The target was not up-to-date.
25094 >1 An error occurred.
25095 When the -q option is not specified, the make utility shall exit with one of the following values:
25096 0 Successful completion.
25097 >0 An error occurred.

```

## 25098 CONSEQUENCES OF ERRORS

25099 Default.

## 25100 APPLICATION USAGE

25101 If there is a source file (such as *./source.c*) and there are two SCCS files corresponding to it  
 25102 (*./s.source.c* and *./SCCS/s.source.c*), on XSI-conformant systems *make* uses the SCCS file in the  
 25103 current directory. However, users are advised to use the underlying SCCS utilities (*admin*, *delta*,  
 25104 *get*, and so on) or the *sccs* utility for all source files in a given directory. If both forms are used for  
 25105 a given source file, future developers are very likely to be confused.

25106 It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to  
 25107 guarantee that they are not affected by local extensions.

25108 The **-k** and **-S** options are both present so that the relationship between the command line, the  
 25109 **MAKEFLAGS** variable, and the makefile can be controlled precisely. If the **k** flag is passed in  
 25110 **MAKEFLAGS** and a command is of the form:

25111 \$(MAKE) -S foo

25112 then the default behavior is restored for the child *make*.

25113 When the **-n** option is specified, it is always added to **MAKEFLAGS**. This allows a recursive  
 25114 *make -n target* to be used to see all of the action that would be taken to update *target*.

25115 Because of widespread historical practice, interpreting a '#' number sign inside a variable as  
 25116 the start of a comment has the unfortunate side effect of making it impossible to place a number  
 25117 sign in a variable, thus forbidding something like:

25118 CFLAGS = "-D COMMENT\_CHAR='#'"

25119 Many historical *make* utilities stop chaining together inference rules when an intermediate target  
 25120 is nonexistent. For example, it might be possible for a *make* to determine that both *.y.c* and *.c.o*  
 25121 could be used to convert *.y* to a *.o*. Instead, in this case, *make* requires the use of a *.y.o* rule.

25122 The best way to provide portable makefiles is to include all of the rules needed in the makefile  
 25123 itself. The rules provided use only features provided by other parts of this volume of  
 25124 IEEE Std. 1003.1-200x. The default rules include rules for optional commands in this volume of  
 25125 IEEE Std. 1003.1-200x. Only rules pertaining to commands that are provided are needed in an  
 25126 implementation's default set.

25127 Macros used within other macros are evaluated when the new macro is used rather than when  
 25128 the new macro is defined. Therefore:

```
25129 MACRO = value1
25130 NEW = $(MACRO)
25131 MACRO = value2
```

```
25132 target:
25133 echo $(NEW)
```

25134 would produce *value2* and not *value1* since **NEW** was not expanded until it was needed in the  
 25135 *echo* command line.

25136 Some historical applications have been known to intermix *target\_name* and *macro=name* operands  
 25137 on the command line, expecting that all of the macros are processed before any of the targets are  
 25138 dealt with. Portable applications do not do this, although some backward compatibility support  
 25139 may be included in some implementations.

25140 The following characters in file names may give trouble: '=', ':', '\', '\'', and '@'. For  
 25141 inference rules, the description of \$< and \$? seem similar. However, an example shows the

25142 minor difference. In a makefile containing:  
 25143 `foo.o: foo.h`  
 25144 if **foo.h** is newer than **foo.o**, yet **foo.c** is older than **foo.o**, the built-in rule to make **foo.o** from  
 25145 **foo.c** is used, with `$<` equal to **foo.c** and `$?` equal to **foo.h**. If **foo.c** is also newer than **foo.o**, `$<` is  
 25146 equal to **foo.c** and `$?` is equal to **foo.h foo.c**.

#### 25147 EXAMPLES

25148 1. The following command:  
 25149 `make`  
 25150 makes the first target found in the makefile.

25151 2. The following command:  
 25152 `make junk`  
 25153 makes the target **junk**.

25154 3. The following makefile says that **pgm** depends on two files, **a.o** and **b.o**, and that they in  
 25155 turn depend on their corresponding source files (**a.c** and **b.c**), and a common file **incl.h**:

```
25156 pgm: a.o b.o
25157 c89 a.o b.o -o pgm
25158 a.o: incl.h a.c
25159 c89 -c a.c
25160 b.o: incl.h b.c
25161 c89 -c b.c
```

25162 4. An example for making optimized **.o** files from **.c** files is:

```
25163 .c.o:
25164 c89 -c -O $*.c
```

25165 or:

```
25166 .c.o:
25167 c89 -c -O $<
```

25168 5. The most common use of the archive interface follows. Here, it is assumed that the source  
 25169 files are all C-language source:

```
25170 lib: lib(file1.o) lib(file2.o) lib(file3.o)
25171 @echo lib is now up-to-date
```

25172 The **.c.a** rule is used to make **file1.o**, **file2.o**, and **file3.o** and insert them into **lib**.

25173 The treatment of escaped <newline> characters throughout the makefile is historical  
 25174 practice. For example, the inference rule:

```
25175 .c.o\
25176 :
```

25177 works, and the macro:

```
25178 f= bar baz\
25179 biz
25180 a:
25181 echo ==$f==
```

```

25182 echoes "==bar baz biz==".
25183 If $? were:
25184 /usr/include/stdio.h /usr/include/unistd.h foo.h
25185 then $(?D) would be:
25186 /usr/include /usr/include .
25187 and $(?F) would be:
25188 stdio.h unistd.h foo.h
25189 6. The contents of the built-in rules can be viewed by running:
25190 make -p -f /dev/null 2>/dev/null

```

#### 25191 RATIONALE

25192 The *make* utility described in this volume of IEEE Std. 1003.1-200x is intended to provide the  
 25193 means for changing portable source code into executables that can be run on a  
 25194 IEEE Std. 1003.1-200x-conforming system. It reflects the most common features present in  
 25195 System V and BSD *makes*.

25196 Historically, the *make* utility has been an especially fertile ground for vendor and research  
 25197 organization-specific syntax modifications and extensions. Examples include:

- 25198 • Syntax supporting parallel execution (such as from various multiprocessor vendors, GNU,  
 25199 and others)
- 25200 • Additional “operators” separating targets and their prerequisites (System V, BSD, and  
 25201 others)
- 25202 • Specifying that command lines containing the strings `$(MAKE)` and `$(MAKE)` are executed  
 25203 when the `-n` option is specified (GNU and System V)
- 25204 • Modifications of the meaning of internal macros when referencing libraries (BSD and others)
- 25205 • Using a single instance of the shell for all of the command lines of the target (BSD and others)
- 25206 • Allowing spaces as well as tabs to delimit command lines (BSD)
- 25207 • Adding C preprocessor-style “include” and “ifdef” constructs (System V, GNU, BSD, and  
 25208 others)
- 25209 • Remote execution of command lines (Sprite and others)
- 25210 • Specifying additional special targets (BSD, System V, and most others)

25211 Additionally, many vendors and research organizations have rethought the basic concepts of  
 25212 *make*, creating vastly extended, as well as completely new, syntaxes. Each of these versions of  
 25213 *make* fulfills the needs of a different community of users; it is unreasonable for this volume of  
 25214 IEEE Std. 1003.1-200x to require behavior that would be incompatible (and probably inferior) to  
 25215 historical practice for such a community.

25216 In similar circumstances, when the industry has enough sufficiently incompatible formats as to  
 25217 make them irreconcilable, this volume of IEEE Std. 1003.1-200x has followed one or both of two  
 25218 courses of action. Commands have been renamed (*cksum*, *echo*, and *pax*) and/or command line  
 25219 options have been provided to select the desired behavior (*grep*, *od*, and *pax*).

25220 Because the syntax specified for the *make* utility is, by and large, a subset of the syntaxes  
 25221 accepted by almost all versions of *make*, it was decided that it would be counter-productive to  
 25222 change the name. And since the makefile itself is a basic unit of portability, it would not be

25223 completely effective to reserve a new option letter, such as *make -P*, to achieve the portable  
25224 behavior. Therefore, the special target **.POSIX** was added to the makefile, allowing users to  
25225 specify “standard” behavior. This special target does not preclude extensions in the *make* utility,  
25226 nor does it preclude such extensions being used by the makefile specifying the target; it does,  
25227 however, preclude any extensions from being applied that could alter the behavior of previously  
25228 valid syntax; such extensions must be controlled via command line options or new special  
25229 targets. It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to  
25230 guarantee that they are not affected by local extensions.

25231 The portable version of *make* described in this reference page is not intended to be the state-of-  
25232 the-art software generation tool and, as such, some newer and more leading-edge features have  
25233 not been included. An attempt has been made to describe the portable makefile in a manner that  
25234 does not preclude such extensions as long as they do not disturb the portable behavior described  
25235 here.

25236 When the **-n** option is specified, it is always added to **MAKEFLAGS**. This allows a recursive  
25237 *make -n target* to be used to see all of the action that would be taken to update *target*.

25238 The definition of **MAKEFLAGS** allows both the System V letter string and the BSD command line  
25239 formats. The two formats are sufficiently different to allow implementations to support both  
25240 without ambiguity.

25241 Early proposals stated that an “unquoted” number sign was treated as the start of a comment.  
25242 The *make* utility does not pay any attention to quotes. A number sign starts a comment  
25243 regardless of its surroundings.

25244 The text about “other implementation-dependent path names may also be tried” in addition to  
25245 **./makefile** and **./Makefile** is to allow such extensions as **SCCS/s.Makefile** and other variations.  
25246 It was made an implementation-dependent requirement (as opposed to unspecified behavior) to  
25247 highlight surprising implementations that might select something unexpected like  
25248 **/etc/Makefile**.

25249 Early proposals contained the macro **NPROC** as a means of specifying that *make* should use *n*  
25250 processes to do the work required. While this feature is a valuable extension for many systems, it  
25251 is not common usage and could require other non-trivial extensions to makefile syntax. This  
25252 extension is not required by this volume of IEEE Std. 1003.1-200x, but could be provided as a  
25253 compatible extension. The macro **PARALLEL** is used by some historical systems with essentially  
25254 the same meaning (but without using a name that is a common system limit value). It is  
25255 suggested that implementors recognize the existing use of **NPROC** and/or **PARALLEL** as  
25256 extensions to *make*.

25257 The default rules are based on System V. The default **CC=** value is *c89* instead of *cc* because this  
25258 volume of IEEE Std. 1003.1-200x does not standardize the utility named *cc*. Thus, every  
25259 conforming application would be required to define **CC=c89** to expect to run. There is no  
25260 advantage conferred by the hope that the makefile might hit the “preferred” compiler because  
25261 this cannot be guaranteed to work. Also, since the portable makescript can only use the *c89*  
25262 options, no advantage is conferred in terms of what the script can do. It is a quality-of-  
25263 implementation issue as to whether *c89* is as valuable as *cc*.

25264 The **-d** option to *make* is frequently used to produce debugging information, but is too  
25265 implementation-dependent to add to this volume of IEEE Std. 1003.1-200x.

25266 The **-p** option is not passed in **MAKEFLAGS** on most historical implementations and to change  
25267 this would cause many implementations to break without sufficiently increased portability.

25268 Commands that begin with a plus sign (**' + '**) are executed even if the **-n** option is present. Based  
25269 on the GNU version of *make*, the behavior of **-n** when the plus-sign prefix is encountered has

been extended to apply to `-q` and `-t` as well. However, the System V convention of forcing command execution with `-n` when the command line of a target contains either of the strings `$(MAKE)` or `${MAKE}` has not been adopted. This functionality appeared in early proposals, but the danger of this approach was pointed out with the following example of a portion of a makefile:

```
subdir:
 cd subdir; rm all_the_files; $(MAKE)
```

The loss of the System V behavior in this case is well-balanced by the safety afforded to other makefiles that were not aware of this situation. In any event, the command line plus-sign prefix can provide the desired functionality.

The double colon in the target rule format is supported in BSD systems to allow more than one target line containing the same target name to have commands associated with it. Since this is not functionality described in the SVID or XPG3 it has been allowed as an extension, but not mandated.

The default rules are provided with text specifying that the built-in rules shall be the same *as if* the listed set were used. The intent is that implementations should be able to use the rules without change, but will be allowed to alter them in ways that do not affect the primary behavior.

The best way to provide portable makefiles is to include all of the rules needed in the makefile itself. The rules provided use only features provided by other portions of this volume of IEEE Std. 1003.1-200x. The default rules include rules for optional commands in this volume of IEEE Std. 1003.1-200x. Only rules pertaining to commands that are provided are needed in the default set of an implementation.

One point of discussion was whether to drop the default rules list from this volume of IEEE Std. 1003.1-200x. They provide convenience, but do not enhance portability of applications. The prime benefit is in portability of users who wish to type *make command* and have the command build from a **command.c** file.

The historical *MAKESHELL* feature was omitted. In some implementations it is used to let a user override the shell to be used to run *make* commands. This was confusing; for a portable *make*, the shell should be chosen by the makefile writer or specified on the *make* command line and not by a user running *make*.

The *make* utilities in most historical implementations process the prerequisites of a target in left-to-right order, and the makefile format requires this. It supports the standard idiom used in many makefiles that produce yacc programs; for example:

```
foo: y.tab.o lex.o main.o
 $(CC) $(CFLAGS) -o $@ t.tab.o lex.o main.o
```

In this example, if *make* chose any arbitrary order, the **lex.o** might not be made with the correct **y.tab.h**. Although there may be better ways to express this relationship, it is widely used historically. Implementations that desire to update prerequisites in parallel should require an explicit extension to *make* or the makefile format to accomplish it, as described previously.

The algorithm for determining a new entry for target rules is partially unspecified. Some historical *makes* allow blank, empty, or comment lines within the collection of commands marked by leading `<tab>s`. A conforming makefile must ensure that each command starts with a `<tab>`, but implementations are free to ignore blank, empty, and comment lines without triggering the start of a new entry.

The ASYNCHRONOUS EVENTS section includes having SIGTERM and SIGHUP, along with the more traditional SIGINT and SIGQUIT, remove the current target unless directed not to do so. SIGTERM and SIGHUP were added to parallel other utilities that have historically cleaned up their work as a result of these signals. When *make* receives any signal other than SIGQUIT, it is required to resend itself the signal it received so that it exits with a status that reflects the signal. The results from SIGQUIT are partially unspecified because, on systems that create **core** files upon receipt of SIGQUIT, the **core** from *make* would conflict with a core file from the command that was running when the SIGQUIT arrived. The main concern was to prevent damaged files from appearing up-to-date when *make* is rerun.

The **.PRECIOUS** special target was extended to affect all targets globally (by specifying no prerequisites). The **.IGNORE** and **.SILENT** special targets were extended to allow prerequisites; it was judged to be more useful in some cases to be able to turn off errors or echoing for a list of targets than for the entire makefile. These extensions to the *make* in System V were made to match historical practice from the BSD *make*.

Macros are not exported to the environment of commands to be run. This was never the case in any historical *make* and would have serious consequences. The environment is the same as the environment to *make* except that **MAKEFLAGS** and macros defined on the *make* command line are added.

Some implementations do not use *system()* for all command lines, as required by the portable makefile format; as a performance enhancement, they select lines without shell metacharacters for direct execution by *execve()*. There is no requirement that *system()* be used specifically, but merely that the same results be achieved. The metacharacters typically used to bypass the direct *execve()* execution have been any of:

```
= | ^ () ; & < > * ? [] : $ \ ' " \ \n
```

The default in some advanced versions of *make* is to group all the command lines for a target and execute them using a single shell invocation; the System V method is to pass each line individually to a separate shell. The single-shell method has the advantages in performance and the lack of a requirement for many continued lines. However, converting to this newer method has caused portability problems with many historical makefiles, so the behavior with the POSIX makefile is specified to be the same as that of System V. It is suggested that the special target **.ONESHELL** be used as an implementation extension to achieve the single-shell grouping for a target or group of targets.

Novice users of *make* have had difficulty with the historical need to start commands with a <tab> character. Since it is often difficult to discern differences between <tab> and <space> characters on terminals or printed listings, confusing bugs can arise. In early proposals, an attempt was made to correct this problem by allowing leading <blank>s instead of <tab>s. However, implementors reported many makefiles that failed in subtle ways following this change, and it is difficult to implement a *make* that unambiguously can differentiate between macro and command lines. There is extensive historical practice of allowing leading spaces before macro definitions. Forcing macro lines into column 1 would be a significant backwards-compatibility problem for some makefiles. Therefore, historical practice was restored.

The System V **INCLUDE** feature was considered, but not included. This would treat a line that began in the first column and contained **INCLUDE <filename>** as an indication to read <filename> at that point in the makefile. This is difficult to use in a portable way, and it raises concerns about nesting levels and diagnostics. System V, BSD, GNU, and others have used different methods for including files.

The System V dynamic dependency feature was not included. It would support:

25362        `cat: $$@.c`

25363        that would expand to;

25364        `cat: cat.c`

25365        This feature exists only in the new version of System V *make* and, while useful, is not in wide  
25366        usage. This means that macros are expanded twice for prerequisites: once at makefile parse time  
25367        and once at target update time.

25368        Consideration was given to adding metarules to the POSIX *make*. This would make `%o: %c` the  
25369        same as `.c.o:`. This is quite useful and available from some vendors, but it would cause too many  
25370        changes to this *make* to support. It would have introduced rule chaining and new substitution  
25371        rules. However, the rules for target names have been set to reserve the `'%'` and `' '` characters.  
25372        These are traditionally used to implement metarules and quoting of target names, respectively.  
25373        Implementors are strongly encouraged to use these characters only for these purposes.

25374        A request was made to extend the suffix delimiter character from a period to any character. The  
25375        metarules feature in newer *makes* solves this problem in a more general way. This volume of  
25376        IEEE Std. 1003.1-200x is staying with the more conservative historical definition.

25377        The standard output format for the `-p` option is not described because it is primarily a  
25378        debugging option and because the format is not generally useful to programs. In historical  
25379        implementations the output is not suitable for use in generating makefiles. The `-p` format has  
25380        been variable across historical implementations. Therefore, the definition of `-p` was only to  
25381        provide a consistently named option for obtaining *make* script debugging information.

25382        Some historical implementations have not cleared the suffix list with `-r`.

25383        Implementations should be aware that some historical applications have intermixed *target\_name*  
25384        and *macro=value* operands on the command line, expecting that all of the macros are processed  
25385        before any of the targets are dealt with. Portable applications do not do this, but some  
25386        backwards-compatibility support may be warranted.

25387        Empty inference rules are specified with a semicolon command rather than omitting all  
25388        commands, as described in an early proposal. The latter case has no traditional meaning and is  
25389        reserved for implementation extensions, such as in GNU *make*.

## 25390 **FUTURE DIRECTIONS**

25391        None.

25412 **NAME**

25413       man — display system documentation

25414 **SYNOPSIS**25415       man [-k] *name*...25416 **DESCRIPTION**

25417       The *man* utility shall write information about each of the *name* operands. If *name* is the name of a  
 25418       standard utility, *man* at a minimum shall write a message describing the syntax used by the  
 25419       standard utility, its options, and operands. If more information is available, the *man* utility shall  
 25420       provide it in an implementation-dependent manner.

25421       An implementation may provide information for values of *name* other than the standard utilities.  
 25422       Standard utilities that are listed as optional and that are not supported by the implementation  
 25423       either shall cause a brief message indicating that fact to be displayed or shall cause a full display  
 25424       of information as described previously.

25425 **OPTIONS**

25426       The *man* utility shall conform to the System Interface Definitions volume of  
 25427       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

25428       The following option shall be supported:

25429       **-k**       Interpret *name* operands as keywords to be used in searching a utilities summary  
 25430       database that contains a brief purpose entry for each standard utility and write lines  
 25431       from the summary database that match any of the keywords. The keyword search shall  
 25432       produce results that are the equivalent of the output of the following command:

```
25433 grep -Ei '
25434 name
25435 name
25436 ...
25437 ' summary-database
```

25438       This assumes that the *summary-database* is a text file with a single entry per line; this  
 25439       organization is not required and the example using *grep -Ei* is merely illustrative of the  
 25440       type of search intended. The purpose entry to be included in the database shall consist  
 25441       of a terse description of the purpose of the utility.

25442 **OPERANDS**

25443       The following operand shall be supported:

25444       *name*       A keyword or the name of a standard utility. When **-k** is not specified and *name*  
 25445       does not represent one of the standard utilities, the results are unspecified.

25446 **STDIN**

25447       Not used.

25448 **INPUT FILES**

25449       None.

25450 **ENVIRONMENT VARIABLES**25451       The following environment variables shall affect the execution of *man*:

25452       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 25453       If *LANG* is unset or null, the corresponding value from the implementation-  
 25454       dependent default locale shall be used. If any of the internationalization variables  
 25455       contains an invalid setting, the utility shall behave as if none of the variables had  
 25456       been defined.

25457 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 25458 internationalization variables.

25459 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 25460 characters (for example, single-byte as opposed to multi-byte characters in  
 25461 arguments and in the summary database). The value of **LC\_CTYPE** need not affect  
 25462 the format of the information written about the name operands.

25463 **LC\_MESSAGES**  
 25464 Determine the locale that should be used to affect the format and contents of  
 25465 diagnostic messages written to standard error and informative messages written to  
 25466 standard output.

25467 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

25468 **PAGER** Determine an output filtering command for writing the output to a terminal. Any  
 25469 string acceptable as a *command\_string* operand to the **sh -c** command shall be valid.  
 25470 When standard output is a terminal device, the reference page output shall be  
 25471 piped through the command. If the **PAGER** variable is null or not set, the  
 25472 command shall be either *more* or another paginator utility documented in the  
 25473 system documentation.

25474 **ASYNCHRONOUS EVENTS**

25475 Default.

25476 **STDOUT**  
 25477 The *man* utility shall write text describing the syntax of the utility *name*, its options and its  
 25478 operands, or, when **-k** is specified, lines from the summary database. The format of this text is  
 25479 implementation-dependent.

25480 **STDERR**  
 25481 Used only for diagnostic messages.

25482 **OUTPUT FILES**  
 25483 None.

25484 **EXTENDED DESCRIPTION**  
 25485 None.

25486 **EXIT STATUS**  
 25487 The following exit values shall be returned:

25488 0 Successful completion.

25489 >0 An error occurred.

25490 **CONSEQUENCES OF ERRORS**  
 25491 Default.

25492 **APPLICATION USAGE**  
 25493 None.

25494 **EXAMPLES**  
 25495 None.

25496 **RATIONALE**  
 25497 It is recognized that the *man* utility is only of minimal usefulness as specified. The opinion of the  
 25498 standard developers was strongly divided as to how much or how little information *man* should  
 25499 be required to provide. They considered, however, that the provision of some portable way of  
 25500 accessing documentation would aid user portability. The arguments against a fuller

25501 specification were:

- 25502 • Large quantities of documentation should not be required on a system that does not have
- 25503 excess disk space.
- 25504 • The current manual system does not present information in a manner that greatly aids user
- 25505 portability.
- 25506 • A “better help system” is currently an area in which vendors feel that they can add value to
- 25507 their POSIX implementations.

25508 The `-f` option was considered, but due to implementation differences, it was not included in this

25509 volume of IEEE Std. 1003.1-200x.

25510 The description was changed to be more specific about what has to be displayed for a utility.

25511 The standard developers considered it insufficient to allow a display of only the synopsis

25512 without giving a short description of what each option and operand does.

25513 The “purpose” entry to be included in the database can be similar to the section title (less the

25514 numeric prefix) from this volume of IEEE Std. 1003.1-200x for each utility. These titles are

25515 similar to those used in historical systems for this purpose.

25516 See *mailx* for rationale concerning the default paginator.

25517 The caveat in the *LC\_CTYPE* description was added because it is not a requirement that an

25518 implementation provide reference pages for all of its supported locales on each system;

25519 changing *LC\_CTYPE* does not necessarily translate the reference page into another language.

25520 This is equivalent to the current state of *LC\_MESSAGES* in IEEE Std. 1003.1-200x—locale-specific

25521 messages are not yet a requirement.

25522 The historical *MANPATH* variable is not included in POSIX because no attempt is made to

25523 specify naming conventions for reference page files, nor even to mandate that they are files at

25524 all. In some systems they could be a true database, a hypertext file, or even fixed strings within

25525 the *man* executable. The standard developers considered the portability of reference pages to be

25526 outside their scope of work (and more appropriate to the POSIX.7 working group developing

25527 application-installation tools). However, users should be aware that *MANPATH* is implemented

25528 on a number of historical systems and that it can be used to tailor the search pattern for reference

25529 pages from the various categories (utilities, functions, file formats, and so on) when the system

25530 administrator reveals the location and conventions for reference pages on the system.

25531 The keyword search can rely on at least the text of the section titles from these utility

25532 descriptions, and the implementation may add more keywords. The term “section titles” refers

25533 to the strings such as:

25534 `man` — Display system documentation

25535 `ps` — Report process status

25536 **FUTURE DIRECTIONS**

25537 None.

25538 **SEE ALSO**

25539 *more*

25540 **CHANGE HISTORY**

25541 First released in Issue 4.

25542 **Issue 5**

25543 FUTURE DIRECTIONS section added.

25544 **NAME**

25545           mesg — permit or deny messages

25546 **SYNOPSIS**25547 UP       mesg [*y*|*n*]

25548

25549 **DESCRIPTION**

25550       The *mesg* utility shall control whether other users are allowed to send messages via *write*, *talk*, or  
 25551       other utilities to a terminal device. The terminal device affected shall be determined by searching  
 25552       for the first terminal in the sequence of devices associated with standard input, standard output,  
 25553       and standard error, respectively. With no arguments, *mesg* shall report the current state without  
 25554       changing it. Processes with appropriate privileges may be able to send messages to the terminal  
 25555       independent of the current state.

25556 **OPTIONS**

25557       None.

25558 **OPERANDS**

25559       The following operands shall be supported in the POSIX locale:

25560       *y*           Grant permission to other users to send messages to the terminal device.25561       *n*           Deny permission to other users to send messages to the terminal device.25562 **STDIN**

25563       Not used.

25564 **INPUT FILES**

25565       None.

25566 **ENVIRONMENT VARIABLES**25567       The following environment variables shall affect the execution of *mesg*:

25568       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 25569       If *LANG* is unset or null, the corresponding value from the implementation-  
 25570       dependent default locale shall be used. If any of the internationalization variables  
 25571       contains an invalid setting, the utility shall behave as if none of the variables had  
 25572       been defined.

25573       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 25574       internationalization variables.

25575       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 25576       characters (for example, single-byte as opposed to multi-byte characters in  
 25577       arguments).

25578       *LC\_MESSAGES*

25579       Determine the locale that should be used to affect the format and contents of  
 25580       diagnostic messages written (by *mesg*) to standard error.

25581 XSI       *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.25582 **ASYNCHRONOUS EVENTS**

25583       Default.

25584 **STDOUT**25585       If no operand is specified, *mesg* shall display the current terminal state in an unspecified format.

25586 **STDERR**

25587           Used only for diagnostic messages.

25588 **OUTPUT FILES**

25589           None.

25590 **EXTENDED DESCRIPTION**

25591           None.

25592 **EXIT STATUS**

25593           The following exit values shall be returned:

25594           0   Receiving messages is allowed.

25595           1   Receiving messages is not allowed.

25596           >1  An error occurred.

25597 **CONSEQUENCES OF ERRORS**

25598           Default.

25599 **APPLICATION USAGE**

25600           The mechanism by which the message status of the terminal is changed is unspecified.  
25601           Therefore, unspecified actions may cause the status of the terminal to change after *mesg* has  
25602           successfully completed. These actions may include, but are not limited to: another invocation of  
25603           the *mesg* utility, login procedures; invocation of the *stty* utility, invocation of the *chmod* utility or  
25604           *chmod()* function, and so on.

25605           Application writers should note that this utility need not be provided on systems that do not  
25606           support the User Portability Utilities option.

25607 **EXAMPLES**

25608           None.

25609 **RATIONALE**

25610           The terminal changed by *mesg* is that associated with the standard input, output, or error, rather  
25611           than the controlling terminal for the session. This is because users logged in more than once  
25612           should be able to change any of their login terminals without having to stop the job running in  
25613           those sessions. This is not a security problem involving the terminals of other users because  
25614           appropriate privileges would be required to affect the terminal of another user.

25615           The method of checking each of the first three file descriptors in sequence until a terminal is  
25616           found was adopted from System V.

25617           The file */dev/tty* is not specified for the terminal device because it was thought to be too  
25618           restrictive. Typical environment changes for the *n* operand are that write permissions are  
25619           removed for *others* and *group* from the appropriate device. It was decided to leave the actual  
25620           description of what is done as unspecified because of potential differences between  
25621           implementations.

25622           The format for standard output is unspecified because of differences between historical  
25623           implementations. This output is generally not useful to shell scripts (they can use the exit  
25624           status), so exact parsing of the output is unnecessary.

25625 **FUTURE DIRECTIONS**

25626           None.

25627 **SEE ALSO**25628 *talk, write*25629 **CHANGE HISTORY**

25632 Aligned with the ISO/IEC 9945-2: 1993 standard.

25633 **Issue 6**

25634 This utility is now marked as part of the User Portability Utilities option.

25635 **NAME**

25636           mkdir — make directories

25637 **SYNOPSIS**25638           mkdir [-p][-m *mode*] *dir*...25639 **DESCRIPTION**25640           The *mkdir* utility shall create the directories specified by the operands, in the order specified.

25641           For each *dir* operand, the *mkdir* utility shall perform actions equivalent to the *mkdir()* function  
 25642           defined in the System Interfaces volume of IEEE Std. 1003.1-200x, called with the following  
 25643           arguments:

- 25644           1. The *dir* operand is used as the *path* argument.
- 25645           2. The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO is used as  
 25646           the *mode* argument. (If the **-m** option is specified, the *mode* option-argument overrides this  
 25647           default.)

25648 **OPTIONS**

25649           The *mkdir* utility shall conform to the System Interface Definitions volume of  
 25650           IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

25651           The following options shall be supported:

25652           **-m *mode***     Set the file permission bits of the newly-created directory to the specified *mode*  
 25653                           value. The *mode* option-argument shall be the same as the *mode* operand defined  
 25654                           for the *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-'  
 25655                           shall be interpreted relative to an assumed initial mode of *a=rwx*; '+' shall add  
 25656                           permissions to the default mode, '-' shall delete permissions from the default  
 25657                           mode.

25658           **-p**           Create any missing intermediate path name components.  
 25659                           For each *dir* operand that does not name an existing directory, effects equivalent to  
 25660                           those caused by the following command shall occur:

```
25661 mkdir -p -m $(umask -S),u+wx $(dirname dir) &&
25662 mkdir [-m mode] dir
```

25663                           where the **-m *mode*** option represents that option supplied to the original  
 25664                           invocation of *mkdir*, if any.

25665           Each *dir* operand that names an existing directory shall be ignored without error.25666 **OPERANDS**

25667           The following operand shall be supported:

25668           *dir*           A path name of a directory to be created.25669 **STDIN**

25670           Not used.

25671 **INPUT FILES**

25672           None.

25673 **ENVIRONMENT VARIABLES**25674           The following environment variables shall affect the execution of *mkdir*:

25675           **LANG**         Provide a default value for the internationalization variables that are unset or null.  
 25676                           If *LANG* is unset or null, the corresponding value from the implementation-  
 25677                           dependent default locale shall be used. If any of the internationalization variables

25678 contains an invalid setting, the utility shall behave as if none of the variables had  
 25679 been defined.

25680 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 25681 internationalization variables.

25682 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 25683 characters (for example, single-byte as opposed to multi-byte characters in  
 25684 arguments).

25685 **LC\_MESSAGES**  
 25686 Determine the locale that should be used to affect the format and contents of  
 25687 diagnostic messages written to standard error.

25688 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

25689 **ASYNCHRONOUS EVENTS**  
 25690 Default.

25691 **STDOUT**  
 25692 Not used.

25693 **STDERR**  
 25694 Used only for diagnostic messages.

25695 **OUTPUT FILES**  
 25696 None.

25697 **EXTENDED DESCRIPTION**  
 25698 None.

25699 **EXIT STATUS**  
 25700 The following exit values shall be returned:

25701 0 All the specified directories were created successfully or the **-p** option was specified and all  
 25702 the specified directories now exist.

25703 >0 An error occurred.

25704 **CONSEQUENCES OF ERRORS**  
 25705 Default.

25706 **APPLICATION USAGE**  
 25707 The default file mode for directories is *a=rwx* (777 on most systems) with selected permissions  
 25708 removed in accordance with the file mode creation mask. For intermediate path name  
 25709 components created by *mkdir*, the mode is the default modified by *u+wx* so that the  
 25710 subdirectories can always be created regardless of the file mode creation mask; if different  
 25711 ultimate permissions are desired for the intermediate directories, they can be changed  
 25712 afterwards with *chmod*.

25713 Note that some of the requested directories may have been created even if an error occurs.

25714 **EXAMPLES**  
 25715 None.

25716 **RATIONALE**  
 25717 The System V **-m** option was included to control the file mode.

25718 The System V **-p** option was included to create any needed intermediate directories and to  
 25719 complement the functionality provided by *rmdir* for removing directories in the path prefix as  
 25720 they become empty. Because no error is produced if any path component already exists, the **-p**

- 25721 option is also useful to ensure that a particular directory exists.
- 25722 The functionality of *mkdir* is described substantially through a reference to the *mkdir()* function
- 25723 in the System Interfaces volume of IEEE Std. 1003.1-200x. For example, by default, the mode of
- 25724 the directory is affected by the file mode creation mask in accordance with the specified
- 25725 behavior of the *mkdir()* function. In this way, there is less duplication of effort required for
- 25726 describing details of the directory creation.
- 25727 **FUTURE DIRECTIONS**
- 25728 None.
- 25729 **SEE ALSO**
- 25730 *rm*, *rmdir*, *umask*, the System Interfaces volume of IEEE Std. 1003.1-200x, *mkdir()*
- 25731 **CHANGE HISTORY**
- 25732 First released in Issue 2.
- 25733 **Issue 4**
- 25734 Aligned with the ISO/IEC 9945-2:1993 standard.
- 25735 **Issue 5**
- 25736 FUTURE DIRECTIONS section added.

25737 **NAME**

25738 mkfifo — make FIFO special files

25739 **SYNOPSIS**25740 mkfifo [-m *mode*] *file*...25741 **DESCRIPTION**25742 The *mkfifo* utility shall create the FIFO special files specified by the operands, in the order  
25743 specified.25744 For each *file* operand, the *mkfifo* utility shall perform actions equivalent to the *mkfifo()* function  
25745 defined in the System Interfaces volume of IEEE Std. 1003.1-200x, called with the following  
25746 arguments:

- 25747 1. The *file* operand is used as the *path* argument.
- 25748 2. The value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP,  
25749 S\_IROTH, and S\_IWOTH is used as the *mode* argument. (If the -m option is specified, the  
25750 value of the *mkfifo()* *mode* argument is unspecified, but the FIFO shall at no time have  
25751 permissions less restrictive than the -m *mode* option-argument.)

25752 **OPTIONS**25753 The *mkfifo* utility shall conform to the System Interface Definitions volume of  
25754 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

25755 The following option shall be supported:

25756 -m *mode* Set the file permission bits of the newly-created FIFO to the specified *mode* value.  
 25757 The *mode* option-argument shall be the same as the *mode* operand defined for the  
 25758 *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-' shall be  
 25759 interpreted relative to an assumed initial mode of *a=rw*.

25760 **OPERANDS**

25761 The following operand shall be supported:

25762 *file* A path name of the FIFO special file to be created.25763 **STDIN**

25764 Not used.

25765 **INPUT FILES**

25766 None.

25767 **ENVIRONMENT VARIABLES**25768 The following environment variables shall affect the execution of *mkfifo*:

25769 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 25770 If *LANG* is unset or null, the corresponding value from the implementation-  
 25771 dependent default locale shall be used. If any of the internationalization variables  
 25772 contains an invalid setting, the utility shall behave as if none of the variables had  
 25773 been defined.

25774 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 25775 internationalization variables.

25776 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 25777 characters (for example, single-byte as opposed to multi-byte characters in  
 25778 arguments).

25779 *LC\_MESSAGES*

25780 Determine the locale that should be used to affect the format and contents of

- 25781 diagnostic messages written to standard error.
- 25782 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 25783 **ASYNCHRONOUS EVENTS**
- 25784 Default.
- 25785 **STDOUT**
- 25786 Not used.
- 25787 **STDERR**
- 25788 Used only for diagnostic messages.
- 25789 **OUTPUT FILES**
- 25790 None.
- 25791 **EXTENDED DESCRIPTION**
- 25792 None.
- 25793 **EXIT STATUS**
- 25794 The following exit values shall be returned:
- 25795 0 All the specified FIFO special files were created successfully.
- 25796 >0 An error occurred.
- 25797 **CONSEQUENCES OF ERRORS**
- 25798 Default.
- 25799 **APPLICATION USAGE**
- 25800 None.
- 25801 **EXAMPLES**
- 25802 None.
- 25803 **RATIONALE**
- 25804 This new utility was added to permit shell applications to create FIFO special files.
- 25805 The **-m** option was added to control the file mode, for consistency with the similar functionality
- 25806 provided the *mkdir* utility.
- 25807 Early proposals included a **-p** option similar to the *mkdir -p* option that created intermediate
- 25808 directories leading up to the FIFO specified by the final component. This was removed because
- 25809 it is not commonly needed and is not common practice with similar utilities.
- 25810 The functionality of *mkfifo* is described substantially through a reference to the *mkfifo()* function
- 25811 in the System Interfaces volume of IEEE Std. 1003.1-200x. For example, by default, the mode of
- 25812 the FIFO file is affected by the file mode creation mask in accordance with the specified behavior
- 25813 of the *mkfifo()* function. In this way, there is less duplication of effort required for describing
- 25814 details of the file creation.
- 25815 **FUTURE DIRECTIONS**
- 25816 None.
- 25817 **SEE ALSO**
- 25818 *umask*, the System Interfaces volume of IEEE Std. 1003.1-200x, *mkfifo()*
- 25819 **CHANGE HISTORY**
- 25820 First released in Issue 3.

25821 **Issue 4**  
25822       Aligned with the ISO/IEC 9945-2: 1993 standard.

25823 **NAME**25824        *more* — display files on a page-by-page basis25825 **SYNOPSIS**25826 UP        *more* [-ceisu][-n *number*][-p *command*][-t *tagstring*][*file* ...]

25827

25828 **DESCRIPTION**

25829        The *more* utility shall read files and either write them to the terminal on a page-by-page basis or  
 25830        filter them to standard output. If standard output is not a terminal device, all input files shall be  
 25831        copied to standard output in their entirety, without modification, except as specified for the **-s**  
 25832        option. If standard output is a terminal device, the files shall be written a number of lines (one  
 25833        screenful) at a time under the control of user commands. See the EXTENDED DESCRIPTION  
 25834        section.

25835        Certain block-mode terminals do not have all the capabilities necessary to support the complete  
 25836        *more* definition; they are incapable of accepting commands that are not terminated with a  
 25837        <newline> character. Implementations that support such terminals shall provide an operating  
 25838        mode to *more* in which all commands can be terminated with a <newline> character on those  
 25839        terminals. This mode:

- 25840        • Shall be documented in the system documentation
- 25841        • Shall, at invocation, inform the user of the terminal deficiency that requires the <newline>  
 25842        character usage and provide instructions on how this warning can be suppressed in future  
 25843        invocations
- 25844        • Shall not be required for implementations supporting only fully capable terminals
- 25845        • Shall not affect commands already requiring <newline> characters
- 25846        • Shall not affect users on the capable terminals from using *more* as described in this volume of  
 25847        IEEE Std. 1003.1-200x

25848 **OPTIONS**

25849        The *more* utility shall conform to the System Interface Definitions volume of  
 25850        IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

25851        The following options shall be supported:

- 25852        **-c**        If a screen is to be written that has no lines in common with the current screen, or  
 25853        *more* is writing its first screen, *more* does not scroll the screen, but instead redraws  
 25854        each line of the screen in turn, from the top of the screen to the bottom. In addition,  
 25855        if *more* is writing its first screen, the screen is cleared. This option may be silently  
 25856        ignored on devices with insufficient terminal capabilities.
- 25857        **-e**        By default, *more* shall exit immediately after writing the last line of the last file in  
 25858        the argument list. If the **-e** option is specified:
  - 25859            1. If there is only a single file in the argument list and that file was completely  
 25860            displayed on a single screen, *more* shall exit immediately after writing the last  
 25861            line of that file.
  - 25862            2. Otherwise, *more* shall exit only after reaching end-of-file on the last file in the  
 25863            argument list twice without an intervening operation. See the EXTENDED  
 25864            DESCRIPTION section.
- 25865        **-i**        Perform pattern matching in searches without regard to case; see the System  
 25866        Interface Definitions volume of IEEE Std. 1003.1-200x, Section 9.2, Regular  
 25867        Expression General Requirements .

25868        **-n number**    Specify the number of lines per screenful. The *number* argument is a positive  
 25869                       decimal integer. The **-n** option shall override any values obtained from any other  
 25870                       source.

25871        **-p command**   Each time a screen from a new file is displayed or redisplayed (including as a  
 25872                       result of *more* commands; for example, **:p**), execute the *more* command(s) in the  
 25873                       command arguments in the order specified, as if entered by the user after the first  
 25874                       screen has been displayed. No intermediate results shall be displayed (that is, if the  
 25875                       command is a movement to a screen different than the normal first screen, only the  
 25876                       screen resulting from the command shall be displayed.) If any of the commands  
 25877                       fail for any reason, an informational message to this effect shall be written, and no  
 25878                       further commands specified using the **-p** option shall be executed for this file.

25879        **-s**                Behave as if consecutive empty lines were a single empty line.

25880        **-t tagstring**   Write the screenful of the file containing the tag named by the *tagstring* argument.  
 25881                       See the *ctags* utility. The tags feature represented by **-t tagstring** and the **:t**  
 25882                       command is optional. It shall be provided on any system that also provides a  
 25883                       conforming implementation of *ctags*; otherwise, the use of **-t** produces undefined  
 25884                       results.

25885                       The file name resulting from the **-t** option shall be logically added as a prefix to the  
 25886                       list of command line files, as if specified by the user. If the tag named by the  
 25887                       *tagstring* argument is not found, it shall be an error, and *more* shall take no further  
 25888                       action.

25889                       If the tag specifies a line number, the first line of the display shall contain the  
 25890                       beginning of that line. If the tag specifies a pattern, the first line of the display shall  
 25891                       contain the beginning of the matching text from the first line of the file that  
 25892                       contains that pattern. If the line does not exist in the file or matching text is not  
 25893                       found, an informational message to this effect shall be displayed, and *more* shall  
 25894                       display the default screen as if **-t** had not been specified.

25895                       If both the **-t tagstring** and **-p command** options are given, the **-t tagstring** shall be  
 25896                       processed first; that is, the file and starting line for the display shall be as specified  
 25897                       by **-t**, and then the **-p more** command shall be executed. If the line (matching text)  
 25898                       specified by the **-t** command does not exist (is not found), no **-p more** command  
 25899                       shall be executed for this file at any time.

25900        **-u**                Treat a <backspace> character as a printable control character, displayed as an  
 25901                       implementation-dependent character sequence (see the EXTENDED  
 25902                       DESCRIPTION section), suppressing backspacing and the special handling that  
 25903                       produces underlined or standout mode text on some terminal types. Also, do not  
 25904                       ignore a <carriage-return> character at the end of a line.

## 25905 OPERANDS

25906        The following operand shall be supported:

25907        *file*            A path name of an input file. If no *file* operands are specified, the standard input  
 25908                       shall be used. If a *file* is '-', the standard input shall be read at that point in the  
 25909                       sequence.

## 25910 STDIN

25911        The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.

## 25912 INPUT FILES

25913 **Notes to Reviewers**

25914 *This section with side shading will not appear in the final copy. - Ed.*

25915 D1, XCU, ERN 308 raises the issue of whether stderr is opened for input and output. There is  
 25916 also a corresponding ERN against XSH.

25917 The input files being examined shall be text files. If standard output is a terminal, standard error  
 25918 shall be used to read commands from the user. If standard output is a terminal, standard error is  
 25919 not readable, and command input is needed, *more* may attempt to obtain user commands from  
 25920 the controlling terminal (for example, **/dev/tty**); otherwise, *more* shall terminate with an error  
 25921 indicating that it was unable to read user commands. If standard output is not a terminal, no  
 25922 error shall result if standard error cannot be opened for reading.

25923 **ENVIRONMENT VARIABLES**

25924 The following environment variables shall affect the execution of *more*:

25925 **COLUMNS** Override the system-selected horizontal screen size. See the System Interface  
 25926 Definitions volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables for  
 25927 valid values and results when it is unset or null.

25928 **EDITOR** Used by the **v** command to select an editor. See the EXTENDED DESCRIPTION  
 25929 section.

25930 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 25931 If **LANG** is unset or null, the corresponding value from the implementation-  
 25932 dependent default locale shall be used. If any of the internationalization variables  
 25933 contains an invalid setting, the utility shall behave as if none of the variables had  
 25934 been defined.

25935 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 25936 internationalization variables.

25937 **LC\_COLLATE**  
 25938 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 25939 character collating elements within regular expressions.

25940 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 25941 characters (for example, single-byte as opposed to multi-byte characters in  
 25942 arguments and input files) and the behavior of character classes within regular  
 25943 expressions.

25944 **LC\_MESSAGES**  
 25945 Determine the locale that should be used to affect the format and contents of  
 25946 diagnostic messages written to standard error and informative messages written to  
 25947 standard output.

25948 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

25949 **LINES** Override the system-selected vertical screen size, used as the number of lines in a  
 25950 screenful. See the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 25951 Chapter 8, Environment Variables for valid values and results when it is unset or  
 25952 null. The **-n** option shall take precedence over the **LINES** variable for determining  
 25953 the number of lines in a screenful.

25954 **MORE** Determine a string containing options described in the OPTIONS section preceded  
 25955 with hyphens and <blank> character-separated as on the command line. Any  
 25956 command line options shall be processed after those in the **MORE** variable, as if

25957 the command line were:

25958 `more $MORE options operands`

25959 The *MORE* variable shall take precedence over the *TERM* and *LINES* variables for  
 25960 determining the number of lines in a screenful.

25961 *TERM* Determine the name of the terminal type. If this variable is unset or null, an  
 25962 unspecified default terminal type is used.

25963 **ASYNCHRONOUS EVENTS**

25964 Default.

25965 **STDOUT**

25966 The standard output shall be used to write the contents of the input files.

25967 **STDERR**

25968 Used for diagnostic messages and user commands (see the INPUT FILES section), and, if  
 25969 standard output is a terminal device, to write a prompting string. The prompting string shall  
 25970 shall appear on the screen line below the last line of the file displayed in the current screenful.  
 25971 The prompt shall contain the name of the file currently being examined and shall contain an  
 25972 end-of-file indication and the name of the next file, if any, when prompting at the end-of-file. If  
 25973 an error or informational message is displayed, it is unspecified whether it is contained in the  
 25974 prompt. If it is not contained in the prompt, it shall be displayed and then the user shall be  
 25975 prompted for a continuation character, at which point another message or the user prompt may  
 25976 be displayed. The prompt is otherwise unspecified. It is unspecified whether informational  
 25977 messages are written for other user commands.

25978 **OUTPUT FILES**

25979 None.

25980 **EXTENDED DESCRIPTION**

25981 The following subsection describes the behavior of *more* when the standard output is a terminal  
 25982 device. If the standard output is not a terminal device, no options other than `-s` shall have any  
 25983 effect, and all input files shall be copied to standard output otherwise unmodified, at which time  
 25984 *more* shall exit without further action.

25985 The number of lines available per screen shall be determined by the `-n` option, if present, or by  
 25986 examining values in the environment (see the ENVIRONMENT VARIABLES section). If neither  
 25987 method yields a number, an unspecified number of lines shall be used.

25988 The maximum number of lines written shall be one less than this number, because the screen  
 25989 line after the last line written shall be used to write a user prompt and user input. If the number  
 25990 of lines in the screen is less than two, the results are undefined. It is unspecified whether user  
 25991 input is permitted to be longer than the remainder of the single line where the prompt has been  
 25992 written.

25993 The number of columns available per line shall be determined by examining values in the  
 25994 environment (see the ENVIRONMENT VARIABLES section), with a default value as described  
 25995 in System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 8, Environment  
 25996 Variables.

25997 Lines that are longer than the display shall be folded; the length at which folding occurs is  
 25998 unspecified, but should be appropriate for the output device. Folding may occur between glyphs  
 25999 of single characters that take up multiple display columns.

26000 When standard output is a terminal and `-u` is not specified, *more* shall treat <backspace>  
 26001 characters and <carriage-return> characters specially:

- 26002 • A character, followed first by a sequence of *n* <backspace> characters (where *n* is the same as  
26003 the number of column positions that the character occupies), then by *n* underscore characters  
26004 ('\_'), shall cause that character to be written as underlined text, if the terminal type  
26005 supports that. The *n* underscore characters, followed first by *n* <backspace> characters, then  
26006 any character with *n* column positions, shall also cause that character to be written as  
26007 underlined text, if the terminal type supports that.
- 26008 • A sequence of *n* <backspace> characters (where *n* is the same as the number of column  
26009 positions that the previous character occupies) that appears between two identical printable  
26010 characters shall cause the first of those two characters to be written as emboldened text (that  
26011 is, visually brighter, standout mode, or inverse-video mode), if the terminal type supports  
26012 that, and the second to be discarded. Immediately subsequent occurrences of  
26013 <backspace>/character pairs for that same character also shall be discarded. (For example,  
26014 the sequence "a\ba\ba\ba" is interpreted as a single emboldened 'a'.)
- 26015 • The *more* utility shall logically discard all other <backspace> characters from the line as well  
26016 as the character which precedes them, if any.
- 26017 • A <carriage-return> character at the end of a line shall be ignored, rather than being written  
26018 as a non-printable character, as described in the next paragraph.

26019 It is implementation-dependent how other non-printable characters are written.  
26020 Implementations should use the same format that they use for the **ex print** command; see the  
26021 OPTIONS section within the *ed* utility. It is unspecified whether a multi-column character shall  
26022 be separated if it crosses a logical line boundary; it shall not be discarded. The behavior is  
26023 unspecified if the number of columns on the display is less than the number of columns any  
26024 single character in the line being displayed would occupy.

26025 When each new file is displayed (or redisplayed), *more* shall write the first screen of the file.  
26026 Once the initial screen has been written, *more* shall prompt for a user command. If the execution  
26027 of the user command results in a screen that has lines in common with the current screen, and  
26028 the device has sufficient terminal capabilities, *more* shall scroll the screen; otherwise, it is  
26029 unspecified whether the screen is scrolled or redrawn.

26030 For all files but the last (including standard input if no file was specified, and for the last file as  
26031 well, if the **-e** option was not specified), when *more* has written the last line in the file, *more* shall  
26032 prompt for a user command. This prompt shall contain the name of the next file as well as an  
26033 indication that *more* has reached end-of-file. If the user command is **f**, <control>-F, <space>, **j**,  
26034 <newline>, **d**, <control>-D, or **s**, *more* shall display the next file. Otherwise, if displaying the last  
26035 file, *more* shall exit. Otherwise, *more* shall execute the user command specified.

26036 Several of the commands described in this section display a previous screen from the input  
26037 stream. In the case that text is being taken from a non-rewindable stream, such as a pipe, it is  
26038 implementation-dependent how much backwards motion is supported. If a command cannot be  
26039 executed because of a limitation on backwards motion, an error message to this effect shall be  
26040 displayed, the current screen shall not change, and the user shall be prompted for another  
26041 command.

26042 If a command cannot be performed because there are insufficient lines to display, *more* shall alert  
26043 the terminal. If a command cannot be performed because there are insufficient lines to display or  
26044 a / command fails: if the input is the standard input, the last screen in the file may be displayed;  
26045 otherwise, the current file and screen shall not change, and the user shall be prompted for  
26046 another command.

26047 The interactive commands in the following sections shall be supported. Some commands can be  
26048 preceded by a decimal integer, called *count* in the following descriptions. If not specified with  
26049 the command, *count* shall default to 1. In the following descriptions, *pattern* is a basic regular

expression, as described in the System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 9.3, Basic Regular Expressions. The term “examine” is historical usage meaning “open the file for viewing”; for example, *more* **foo** would be expressed as examining file **foo**. In the following descriptions, unless otherwise specified, *line* is a logical line in the *more* display, not a line from the file being examined.

In the following descriptions, the *current position* refers to two things:

1. The position of the current line on the screen
2. The line number (in the file) of the current line on the screen

Usually, the line on the screen corresponding to the current position is the third line on the screen. If this is not possible (there are fewer than three lines to display or this is the first page of the file, or it is the last page of the file), then the current position is either the first or last line on the screen as described later.

## 26062 Help

26063 *Synopsis:*     **h**

26064 Write a summary of these commands and other implementation-dependent commands. The  
26065 behavior shall be as if the *more* utility were executed with the **-e** option on a file that contained  
26066 the summary information. The user shall be prompted as described earlier in this section when  
26067 end-of-file is reached. If the user command is one of those specified to continue to the next file,  
26068 *more* shall return to the file and screen state from which the **h** command was executed.

## 26069 Scroll Forward One Screenful

26070 *Synopsis:*     [ *count* ] **f**  
26071               [ *count* ] <control> -F

26072 Scroll forward *count* lines, with a default of one screenful. If *count* is more than the screen size,  
26073 only the final screenful shall be written.

## 26074 Scroll Backward One Screenful

26075 *Synopsis:*     [ *count* ] **b**  
26076               [ *count* ] <control> -B

26077 Scroll backward *count* lines, with a default of one screenful (see the **-n** option). If *count* is more  
26078 than the screen size, only the final screenful shall be written.

## 26079 Scroll Forward One Line

26080 *Synopsis:*     [ *count* ] <space>  
26081               [ *count* ] **j**  
26082               [ *count* ] <newline>

26083 Scroll forward *count* lines. The default *count* for the <space> character shall be one screenful; for **j**  
26084 and <newline> character, one line. The entire *count* lines shall be written, even if *count* is more  
26085 than the screen size.

**26086 Scroll Backward One Line**

26087 *Synopsis:*     [ *count* ]k

26088 Scroll backward *count* lines. The entire *count* lines shall be written, even if *count* is more than the  
26089 screen size.

**26090 Scroll Forward One Half Screenful**

26091 *Synopsis:*     [ *count* ]d

26092               [ *count* ]<control>-D

26093 Scroll forward *count* lines, with a default of one half of the screen size. If *count* is specified, it  
26094 shall become the new default for subsequent **d**, <control>-D, and **u** commands.

**26095 Skip Forward One Line**

26096 *Synopsis:*     [ *count* ]s

26097 Display the screenful beginning with the line *count* lines after the last line on the current screen.  
26098 If *count* would cause the current position to be such that less than one screenful would be  
26099 written, the last screenful in the file shall be written.

**26100 Scroll Backward One Half Screenful**

26101 *Synopsis:*     [ *count* ]u

26102               [ *count* ]<control>-U

26103 Scroll backward *count* lines, with a default of one half of the screen size. If *count* is specified, it  
26104 shall become the new default for subsequent **d**, <control>-D, **u**, and <control>-U commands.  
26105 The entire *count* lines shall be written, even if *count* is more than the screen size.

**26106 Go to Beginning of File**

26107 *Synopsis:*     [ *count* ]g

26108 Display the screenful beginning with line *count*.

**26109 Go to End-of-File**

26110 *Synopsis:*     [ *count* ]G

26111 If *count* is specified, display the screenful beginning with the line *count*. Otherwise, display the  
26112 last screenful of the file.

**26113 Refresh the Screen**

26114 *Synopsis:*     r

26115               <control>-L

26116 Refresh the screen.

## 26117 **Discard and Refresh**

26118 *Synopsis:*     **R**

26119 Refresh the screen, discarding any buffered input. If the current file is non-seekable, buffered  
26120 input shall not be discarded and the **R** command is equivalent to the **r** command.

## 26121 **Mark Position**

26122 *Synopsis:*     **mletter**

26123 Mark the current position with the letter named by *letter*, where *letter* represents the name of one  
26124 of the lowercase letters of the portable character set. When a new file is examined, all marks may  
26125 be lost.

## 26126 **Return to Mark**

26127 *Synopsis:*     '**letter**

26128 Return to the position that was previously marked with the letter named by *letter*, making that  
26129 line the current position.

## 26130 **Return to Previous Position**

26131 *Synopsis:*     ''

26132 Return to the position from which the last large movement command was executed (where a  
26133 “large movement” is defined as any movement of more than a screenful of lines). If no such  
26134 movements have been made, return to the beginning of the file.

## 26135 **Search Forward for Pattern**

26136 *Synopsis:*     [*count*]/[!]*pattern*<newline>

26137 Display the screenful beginning with the *count*th line containing the pattern. The search shall  
26138 start after the first line currently displayed. The null regular expression ('/' followed by a  
26139 <newline> character) shall repeat the search using the previous regular expression, with a  
26140 default *count*. If the character '!' is included, the matching lines shall be those that do not  
26141 contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall be  
26142 displayed.

## 26143 **Search Backward for Pattern**

26144 *Synopsis:*     [*count*?][!]*pattern*<newline>

26145 Display the screenful beginning with the *count*th previous line containing the pattern. The  
26146 search shall start on the last line before the first line currently displayed. The null regular  
26147 expression ('?' followed by a <newline> character) shall repeat the search using the previous  
26148 regular expression, with a default *count*. If the character '!' is included, matching lines shall be  
26149 those that do not contain the *pattern*.

26150 If no match is found for the *pattern*, a message to that effect shall be displayed.

**26151 Repeat Search**

26152 *Synopsis:*     [ *count* ]n

26153 Repeat the previous search for *count*th line containing the last *pattern* (or not containing the last  
26154 *pattern*, if the previous search was " / ! " or " ? ! " ).

**26155 Repeat Search in Reverse**

26156 *Synopsis:*     [ *count* ]N

26157 Repeat the search in the opposite direction of the previous search for the *count*th line containing  
26158 the last *pattern* (or not containing the last *pattern*, if the previous search was " / ! " or " ? ! " ).

**26159 Examine New File**

26160 *Synopsis:*     :e [ *filename* ]<newline>

26161 Examine a new file. If the *filename* argument is not specified, the current file (see the :n and :p  
26162 commands below) shall be re-examined. The *filename* shall be subjected to the process of shell  
26163 word expansions (see Section 2.6 on page 49); if more than a single path name results, the effects  
26164 are unspecified. If *filename* is a number sign ( '#' ), the previously examined file shall be re-  
26165 examined. If *filename* is not accessible for any reason (including that it is a non-seekable file), an  
26166 error message to this effect shall be displayed and the current file and screen shall not change.

**26167 Examine Next File**

26168 *Synopsis:*     [ *count* ]:n

26169 Examine the next file. If a number *count* is specified, the *count*th next file shall be examined. If  
26170 *filename* refers to a non-seekable file, the results are unspecified.

**26171 Examine Previous File**

26172 *Synopsis:*     [ *count* ]:p

26173 Examine the previous file. If a number *count* is specified, the *count*th previous file shall be  
26174 examined. If *filename* refers to a non-seekable file, the results are unspecified.

**26175 Go to Tag**

26176 *Synopsis:*     :t *tagstring*<newline>

26177 If the file containing the tag named by the *tagstring* argument is not the current file, examine the  
26178 file, as if the :e command was executed with that file as the argument. Otherwise, or in addition,  
26179 display the screenful beginning with the tag, as described for the -t option (see the OPTIONS  
26180 section). If the *ctags* utility is not supported by the system, the use of :t produces undefined  
26181 results.

**26182 Invoke Editor**

26183 *Synopsis:*     v

26184 Invoke an editor to edit the current file being examined. If standard input is being examined, the  
26185 results are unspecified. The name of the editor shall be taken from the environment variable  
26186 *EDITOR*, or shall default to *vi*. If the last path name component in *EDITOR* is either *vi* or *ex*, the  
26187 editor shall be invoked with a - *linenumber* command line argument, where *linenumber* is the line  
26188 number of the physical line containing the logical line currently displayed as the first line of the  
26189 screen. It is implementation-dependent whether line-setting options are passed to editors other

26190 than *vi* and *ex*.  
 26191 When the editor exits, *more* shall resume with the same file and screen as when the editor was  
 26192 invoked.

### 26193 **Display Position**

26194 *Synopsis:*        =  
 26195                    <control>-G

26196 Write a message for which the information references the first byte of the line after the last line of  
 26197 the file on the screen. This message shall include the name of the file currently being examined,  
 26198 its number relative to the total number of files there are to examine, the physical line number,  
 26199 the byte number and the total bytes in the file, and what percentage of the file precedes the  
 26200 current position. If *more* is reading from standard input, or the file is shorter than a single screen,  
 26201 the line number, the byte number, the total bytes, and the percentage need not be written.

### 26202 **Quit**

26203 *Synopsis:*        q  
 26204                   :q  
 26205                   ZZ

26206 Exit *more*.

### 26207 **EXIT STATUS**

26208 The following exit values shall be returned:

26209       0   Successful completion.

26210       >0   An error occurred.

### 26211 **CONSEQUENCES OF ERRORS**

26212 If an error is encountered accessing a file when using the **:n** command, *more* shall attempt to  
 26213 examine the next file in the argument list, but the final exit status shall be affected. If an error is  
 26214 encountered accessing a file via the **:p** command, *more* shall attempt to examine the previous file  
 26215 in the argument list, but the final exit status shall be affected. If an error is encountered accessing  
 26216 a file via the **:e** command, *more* shall remain in the current file and the final exit status shall not  
 26217 be affected.

### 26218 **APPLICATION USAGE**

26219 When the standard output is not a terminal, only the **-s** filter-modification option is effective.  
 26220 This is based on historical practice. For example, a typical implementation of *man* pipes its  
 26221 output through *more -s* to squeeze excess white space for terminal users. When *man* is piped to  
 26222 *lp*, however, it is undesirable for this squeezing to happen.

26223 Application writers should note that this utility need not be provided on systems that do not  
 26224 support the User Portability Utilities option.

### 26225 **EXAMPLES**

26226 The **-p** allows arbitrary commands to be executed at the start of each file. Examples are:

26227 *more -p G file1 file2*  
 26228       Examine each file starting with its last screenful.

26229 *more -p 100 file1 file2*  
 26230       Examine each file starting with line 100 in the current position (usually the third line, so line  
 26231 98 would be the first line written).

26232 *more* -p /100 file1 file2

26233 Examine each file starting with the first line containing the string "100" in the current  
26234 position

#### 26235 RATIONALE

26236 The *more* utility, available in BSD and BSD-derived systems, was chosen as the prototype for the  
26237 POSIX file display program since it is more widely available than either the public-domain  
26238 program *less* or than *pg*, a pager provided in System V. The 4.4 BSD *more* is the model for the  
26239 features selected; it is almost fully upward-compatible from the 4.3 BSD version in wide use and  
26240 has become more amenable for *vi* users. Several features originally derived from various file  
26241 editors, found in both *less* and *pg*, have been added to this volume of IEEE Std. 1003.1-200x as  
26242 they have proved extremely popular with users.

26243 There are inconsistencies between *more* and *vi* that result from historical practice. For example,  
26244 the single-character commands **h**, **f**, **b**, and <space> are screen movers in *more*, but cursor  
26245 movers in *vi*. These inconsistencies were maintained because the cursor movements are not  
26246 applicable to *more* and the powerful functionality achieved without the use of the control key  
26247 justifies the differences.

26248 The tags interface has been included in a program that is not a text editor because it promotes  
26249 another degree of consistent operation with *vi*. It is conceivable that the paging environment of  
26250 *more* would be superior for browsing source code files in some circumstances.

26251 The operating mode referred to for block-mode terminals effectively adds a <newline> to each  
26252 Synopsis line that currently has none. So, for example, **d**<newline> would page one screenful.  
26253 The mode could be triggered by a command line option, environment variable, or some other  
26254 method. The details are not imposed by this volume of IEEE Std. 1003.1-200x because there are  
26255 so few systems known to support such terminals. Nevertheless, it was considered that all  
26256 systems should be able to support *more* given the exception cited for this small community of  
26257 terminals because, in comparison to *vi*, the cursor movements are few and the command set  
26258 relatively amenable to the optional <newline>s.

26259 Some versions of *more* provide a shell escaping mechanism similar to the *ex* ! command. The  
26260 standard developers did not consider that this was necessary in a paginator, particularly given  
26261 the wide acceptance of multiple window terminals and job control features. (They chose to  
26262 retain such features in the editors and *mailx* because the shell interaction also gives an  
26263 opportunity to modify the editing buffer, which is not applicable to *more*).

26264 The -p (position) option replaces the + command because of the Utility Syntax Guidelines. In  
26265 early proposals, it took a *pattern* argument, but historical *less* provided the *more* general facility of  
26266 a command. It would have been desirable to use the same -c as *ex* and *vi*, but the letter was  
26267 already in use.

26268 The text stating "from a non-rewindable stream ... implementations may limit the amount of  
26269 backwards motion supported" would allow an implementation that permitted no backwards  
26270 motion beyond text already on the screen. It was not possible to require a minimum amount of  
26271 backwards motion that would be effective for all conceivable device types. The implementation  
26272 should allow the user to back up as far as possible, within device and reasonable memory  
26273 allocation constraints.

26274 Historically, non-printable characters were displayed using the ARPA standard mappings,  
26275 which are as follows:

- 26276 1. Printable characters are left alone.
- 26277 2. Control characters less than \177 are represented as followed by the character offset from  
26278 the '@' character in the ASCII map; for example, \007 is represented as 'G'.

|       |                                                                                                                                                       |  |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| 26279 | 3. \177 is represented as followed by ' ? '.                                                                                                          |  |
| 26280 | The display of characters having their eighth bit set was less standard. Existing implementations                                                     |  |
| 26281 | use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed characters with their                                                     |  |
| 26282 | eighth bit set as the two characters "M-, " followed by the seven bit display as described                                                            |  |
| 26283 | previously.) The latter probably has the best claim to historical practice because it was used with                                                   |  |
| 26284 | the -v option of 4 BSD and 4 BSD-derived versions of the <i>cat</i> utility since 1980.                                                               |  |
| 26285 | No specific display format is required by IEEE Std. 1003.1-200x. Implementations are                                                                  |  |
| 26286 | encouraged to conform to historic practice in the absence of any strong reason to diverge.                                                            |  |
| 26287 | <b>FUTURE DIRECTIONS</b>                                                                                                                              |  |
| 26288 | None.                                                                                                                                                 |  |
| 26289 | <b>SEE ALSO</b>                                                                                                                                       |  |
| 26290 | <i>ctags, ed, ex, vi</i>                                                                                                                              |  |
| 26291 | <b>CHANGE HISTORY</b>                                                                                                                                 |  |
| 26292 | First released in Issue 4.                                                                                                                            |  |
| 26293 | <b>Issue 5</b>                                                                                                                                        |  |
| 26294 | FUTURE DIRECTIONS section added.                                                                                                                      |  |
| 26295 | <b>Issue 6</b>                                                                                                                                        |  |
| 26296 | This utility is now marked as part of the User Portability Utilities option.                                                                          |  |
| 26297 | The obsolescent SYNOPSIS is removed.                                                                                                                  |  |
| 26298 | The utility has been extensively reworked for alignment with the IEEE P1003.2b draft standard:                                                        |  |
| 26299 | <ul style="list-style-type: none"> <li>• Changes have been made as result of PASC Interpretations 1003.2-92 #37 and 109.</li> </ul>                   |  |
| 26300 | <ul style="list-style-type: none"> <li>• The <i>more</i> utility should be able to handle underlined and emboldened displays of characters</li> </ul> |  |
| 26301 | that are wider than a single column position.                                                                                                         |  |

26302 **NAME**

26303 mv — move files

26304 **SYNOPSIS**26305 mv [-fi] *source\_file target\_file*26306 mv [-fi] *source\_file... target\_file*26307 **DESCRIPTION**

26308 In the first synopsis form, the *mv* utility shall move the file named by the *source\_file* operand to  
 26309 the *destination* specified by the *target\_file*. This first synopsis form is assumed when the final  
 26310 operand does not name an existing directory and is not a symbolic link referring to an existing  
 26311 directory.

26312 In the second synopsis form, *mv* shall move each file named by a *source\_file* operand to a  
 26313 *destination* file in the existing directory named by the *target\_dir* operand, or referenced if  
 26314 *target\_dir* is a symbolic link referring to an existing directory. The *destination* path for each  
 26315 *source\_file* shall be the concatenation of the target directory, a single slash character, and the last  
 26316 path name component of the *source\_file*. This second form is assumed when the final operand  
 26317 names an existing directory.

26318 If any operand specifies an existing file of a type not specified by the System Interfaces volume  
 26319 of IEEE Std. 1003.1-200x, the behavior is implementation-dependent.

26320 For each *source\_file* the following steps shall be taken:

26321 1. If the destination path exists, the *-f* option is not specified, and either of the following  
 26322 conditions is true:

26323 a. The permissions of the destination path do not permit writing and the standard input  
 26324 is a terminal.

26325 b. The *-i* option is specified.

26326 The *mv* utility shall write a prompt to standard error and read a line from standard input. If  
 26327 the response is not affirmative, *mv* shall do nothing more with the current *source\_file* and  
 26328 go on to any remaining *source\_files*.

26329 2. The *mv* utility shall perform actions equivalent to the *rename()* function defined in the  
 26330 System Interfaces volume of IEEE Std. 1003.1-200x, called with the following arguments:

26331 a. The *source\_file* operand is used as the *old* argument.

26332 b. The destination path is used as the *new* argument.

26333 If this succeeds, *mv* shall do nothing more with the current *source\_file* and go on to any  
 26334 remaining *source\_files*. If this fails for any reasons other than those described for the *errno*  
 26335 [EXDEV] in the System Interfaces volume of IEEE Std. 1003.1-200x, *mv* shall write a  
 26336 diagnostic message to standard error, do nothing more with the current *source\_file*, and go  
 26337 on to any remaining *source\_files*.

26338 3. If the destination path exists, and it is a file of type directory and *source\_file* is not a file of  
 26339 type directory, or it is a file not of type directory and *source\_file* is a file of type directory,  
 26340 *mv* shall write a diagnostic message to standard error, do nothing more with the current  
 26341 *source\_file*, and go on to any remaining *source\_files*.

26342 4. If the destination path exists, *mv* shall attempt to remove it. If this fails for any reason, *mv*  
 26343 shall write a diagnostic message to standard error, do nothing more with the current  
 26344 *source\_file*, and go on to any remaining *source\_files*.

- 26345 5. The file hierarchy rooted in *source\_file* shall be duplicated as a file hierarchy rooted in the  
 26346 *destination* path. If *source\_file* or any of the files below it in the hierarchy are symbolic links,  
 26347 the links themselves shall be duplicated, including their contents, rather than any files to  
 26348 which they refer. The following characteristics of each file in the file hierarchy shall be  
 26349 duplicated:
- 26350 • The time of last data modification and time of last access
  - 26351 • The user ID and group ID
  - 26352 • The file mode
- 26353 If the user ID, group ID, or file mode of a regular file cannot be duplicated, the file mode  
 26354 bits S\_ISUID and S\_ISGID shall not be duplicated.
- 26355 When files are duplicated to another file system, the implementation may require that the  
 26356 process invoking *mv* has read access to each file being duplicated.
- 26357 If the duplication of the file hierarchy fails for any reason, *mv* shall write a diagnostic  
 26358 message to standard error, do nothing more with the current *source\_file*, and go on to any  
 26359 remaining *source\_files*.
- 26360 If the duplication of the file characteristics fails for any reason, *mv* shall write a diagnostic  
 26361 message to standard error, but this failure shall not cause *mv* to modify its exit status.
- 26362 6. The file hierarchy rooted in *source\_file* shall be removed. If this fails for any reason, *mv* shall  
 26363 write a diagnostic message to the standard error, do nothing more with the current  
 26364 *source\_file*, and go on to any remaining *source\_files*.

#### 26365 OPTIONS

- 26366 The *mv* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 26367 Section 12.2, Utility Syntax Guidelines.
- 26368 The following options shall be supported:
- 26369 **-f** Do not prompt for confirmation if the destination path exists. Any previous  
 26370 occurrences of the **-i** option is ignored.
  - 26371 **-i** Prompt for confirmation if the destination path exists. Any previous occurrences of  
 26372 the **-f** option is ignored.
- 26373 Specifying more than one of the **-f** or **-i** options shall not be considered an error. The last option  
 26374 specified shall determine the behavior of *mv*.

#### 26375 OPERANDS

- 26376 The following operands shall be supported:
- 26377 *source\_file* A path name of a file or directory to be moved.
  - 26378 *target\_file* A new path name for the file or directory being moved.
  - 26379 *target\_dir* A path name of an existing directory into which to move the input files.

#### 26380 STDIN

- 26381 Used to read an input line in response to each prompt specified in the STDERR section.  
 26382 Otherwise, the standard input shall not be used.

#### 26383 INPUT FILES

- 26384 The input files specified by each *source\_file* operand can be of any file type.

26385 **ENVIRONMENT VARIABLES**

26386 The following environment variables shall affect the execution of *mv*:

26387 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 26388 If *LANG* is unset or null, the corresponding value from the implementation-  
 26389 dependent default locale shall be used. If any of the internationalization variables  
 26390 contains an invalid setting, the utility shall behave as if none of the variables had  
 26391 been defined.

26392 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 26393 internationalization variables.

26394 **LC\_COLLATE**  
 26395 Determine the locale for the behavior of ranges, equivalence classes and multi-  
 26396 character collating elements used in the extended regular expression defined for  
 26397 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

26398 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 26399 characters (for example, single-byte as opposed to multi-byte characters in  
 26400 arguments and input files), the behavior of character classes used in the extended  
 26401 regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*  
 26402 category.

26403 **LC\_MESSAGES**  
 26404 Determine the locale for the processing of affirmative responses that should be  
 26405 used to affect the format and contents of diagnostic messages written to standard  
 26406 error.

26407 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

26408 **ASYNCHRONOUS EVENTS**

26409 Default.

26410 **STDOUT**

26411 Not used.

26412 **STDERR**

26413 Prompts shall be written to the standard error under the conditions specified in the  
 26414 DESCRIPTION section. The prompts shall contain the *destination* path name, but their format is  
 26415 otherwise unspecified. Otherwise, the standard error shall be used only for diagnostic messages.

26416 **OUTPUT FILES**

26417 The output files may be of any file type.

26418 **EXTENDED DESCRIPTION**

26419 None.

26420 **EXIT STATUS**

26421 The following exit values shall be returned:

26422 0 All input files were moved successfully.

26423 >0 An error occurred.

26424 **CONSEQUENCES OF ERRORS**

26425 If the copying or removal of *source\_file* is prematurely terminated by a signal or error, *mv* may  
 26426 leave a partial copy of *source\_file* at the source or destination. The *mv* utility shall not modify  
 26427 both *source\_file* and the destination path simultaneously; termination at any point shall leave  
 26428 either *source\_file* or the destination path complete.

## 26429 APPLICATION USAGE

26430 None.

## 26431 EXAMPLES

26432 If the current directory contains only files **a** (of any type defined by the System Interfaces  
 26433 volume of IEEE Std. 1003.1-200x), **b** (also of any type), and a directory **c**:

26434 mv a b c

26435 mv c d

26436 results with the original files **a** and **b** residing in the directory **d** in the current directory.

## 26437 RATIONALE

26438 Early proposals diverged from the SVID and BSD historical practice in that they required that  
 26439 when the destination path exists, the **-f** option is not specified, and input is not a terminal, *mv*  
 26440 fails. This was done for compatibility with *cp*. The current text returns to historical practice. It  
 26441 should be noted that this is consistent with the *rename()* function defined in the System  
 26442 Interfaces volume of IEEE Std. 1003.1-200x, which does not require write permission on the  
 26443 target.

26444 For absolute clarity, paragraph (1), describing the behavior of *mv* when prompting for  
 26445 confirmation, should be interpreted in the following manner:

```
26446 if (exists AND (NOT f_option) AND
26447 ((not_writable AND input_is_terminal) OR i_option))
```

26448 The **-i** option exists on BSD systems, giving applications and users a way to avoid accidentally  
 26449 unlinking files when moving others. When the standard input is not a terminal, the 4.3 BSD *mv*  
 26450 deletes all existing destination paths without prompting, even when **-i** is specified; this is  
 26451 inconsistent with the behavior of the 4.3 BSD *cp* utility, which always generates an error when  
 26452 the file is unwritable and the standard input is not a terminal. The standard developers decided  
 26453 that use of **-i** is a request for interaction, so when the *destination* path exists, the utility takes  
 26454 instructions from whatever responds to standard input.

26455 The *rename()* function is able to move directories within the same file system. Some historical  
 26456 versions of *mv* have been able to move directories, but not to a different file system. The  
 26457 standard developers considered that this was an annoying inconsistency, so this volume of  
 26458 IEEE Std. 1003.1-200x requires directories to be able to be moved even across file systems. There  
 26459 is no **-R** option to confirm that moving a directory is actually intended, since such an option was  
 26460 not required for moving directories in historical practice. Requiring the application to specify it  
 26461 sometimes, depending on the destination, seemed just as inconsistent. The semantics of the  
 26462 *rename()* function were preserved as much as possible. For example, *mv* is not permitted to  
 26463 “rename” files to or from directories, even though they might be empty and removable.

26464 Historic implementations of *mv* did not exit with a non-zero exit status if they were unable to  
 26465 duplicate any file characteristics when moving a file across file systems, nor did they write a  
 26466 diagnostic message for the user. The former behavior has been preserved to prevent scripts from  
 26467 breaking; a diagnostic message is now required, however, so that users are alerted that the file  
 26468 characteristics have changed.

26469 The exact format of the interactive prompts is unspecified. Only the general nature of the  
 26470 contents of prompts are specified because implementations may desire more descriptive  
 26471 prompts than those used on historical implementations. Therefore, an application not using the  
 26472 **-f** option or using the **-i** option relies on the system to provide the most suitable dialog directly  
 26473 with the user, based on the behavior specified.

26474 When *mv* is dealing with a single file system and *source\_file* is a symbolic link, the link itself is  
 26475 moved as a consequence of the dependence on the *rename()* functionality, per the

26476 DESCRIPTION. Across file systems, this has to be made explicit.

26477 **FUTURE DIRECTIONS**

26478 None.

26479 **SEE ALSO**

26480 *cp, ln*

26481 **CHANGE HISTORY**

26482 First released in Issue 2.

26483 **Issue 4**

26484 Aligned with the ISO/IEC 9945-2:1993 standard.

26485 **Issue 6**

26486 The *mv* utility is changed to describe processing of symbolic links as specified in the  
26487 IEEE P1003.2b draft standard.

## 26488 NAME

26489 newgrp — change to a new group

## 26490 SYNOPSIS

26491 UP newgrp [-l][group]

26492

## 26493 DESCRIPTION

26494 The *newgrp* utility shall create a new shell execution environment with a new real and effective  
 26495 group identification. Of the attributes listed in Section 2.12 on page 90, the new shell execution  
 26496 environment shall retain the working directory, file creation mask, and exported variables from  
 26497 the previous environment (that is, open files, traps, unexported variables, alias definitions, shell  
 26498 functions, and *set* options may be lost). All other aspects of the process environment that are  
 26499 preserved by the *exec* family of functions defined in the System Interfaces volume of  
 26500 IEEE Std. 1003.1-200x shall also be preserved by *newgrp*; whether other aspects are preserved is  
 26501 unspecified.

26502 A failure to assign the new group identifications (for example, for security or password-related  
 26503 reasons) shall not prevent the new shell execution environment from being created.

26504 The *newgrp* utility shall affect the supplemental groups for the process as follows:

- 26505 • On systems where the effective group ID is normally in the supplementary group list (or  
 26506 whenever the old effective group ID actually is in the supplementary group list):
  - 26507 — If the new effective group ID is also in the supplementary group list, *newgrp* shall change  
 26508 the effective group ID.
  - 26509 — If the new effective group ID is not in the supplementary group list, *newgrp* shall add the  
 26510 new effective group ID to the list, if there is room to add it.
- 26511 • On systems where the effective group ID is not normally in the supplementary group list (or  
 26512 whenever the old effective group ID is not in the supplementary group list):
  - 26513 — If the new effective group ID is in the supplementary group list, *newgrp* shall delete it.
  - 26514 — If the old effective group ID is not in the supplementary list, *newgrp* shall add it if there is  
 26515 room.

26516 **Note:** The System Interfaces volume of IEEE Std. 1003.1-200x does not specify whether the  
 26517 effective group ID of a process is included in its supplementary group list.

26518 With no operands, *newgrp* shall change the effective group back to the groups identified in the  
 26519 user's user entry, and shall set the list of supplementary groups to that set in the user's group  
 26520 database entries.

26521 If a password is required for the specified group, and the user is not listed as a member of that  
 26522 group in the group database, the user shall be prompted to enter the correct password for that  
 26523 group. If the user is listed as a member of that group, no password is requested. If no password  
 26524 is required for the specified group, it is implementation-dependent whether users not listed as  
 26525 members of that group can change to that group. Whether or not a password is required,  
 26526 implementation-dependent system accounting or security mechanisms may impose additional  
 26527 authorization restrictions that may cause *newgrp* to write a diagnostic message and suppress the  
 26528 changing of the group identification.

## 26529 OPTIONS

26530 The *newgrp* utility shall conform to the System Interface Definitions volume of  
 26531 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

26532 The following option shall be supported:

26533 **-l** (The letter ell.) Change the environment to what would be expected if the user  
26534 actually logged in again.

#### 26535 OPERANDS

26536 The following operand shall be supported:

26537 *group* A group name from the group database or a non-negative numeric group ID.  
26538 Specifies the group ID to which the real and effective group IDs shall be set. If  
26539 *group* is a non-negative numeric string and exists in the group database as a group  
26540 name (see *getgrnam()*), the numeric group ID associated with that group name  
26541 shall be used as the group ID.

#### 26542 STDIN

26543 Not used.

#### 26544 INPUT FILES

26545 The file */dev/tty* shall be used to read a single line of text for password checking, when one is  
26546 required.

#### 26547 ENVIRONMENT VARIABLES

26548 The following environment variables shall affect the execution of *newgrp*:

26549 *LANG* Provide a default value for the internationalization variables that are unset or null.  
26550 If *LANG* is unset or null, the corresponding value from the implementation-  
26551 dependent default locale shall be used. If any of the internationalization variables  
26552 contains an invalid setting, the utility shall behave as if none of the variables had  
26553 been defined.

26554 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
26555 internationalization variables.

26556 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
26557 characters (for example, single-byte as opposed to multi-byte characters in  
26558 arguments).

#### 26559 LC\_MESSAGES

26560 Determine the locale that should be used to affect the format and contents of  
26561 diagnostic messages written to standard error.

26562 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 26563 ASYNCHRONOUS EVENTS

26564 Default.

#### 26565 STDOUT

26566 Not used.

#### 26567 STDERR

26568 Used for diagnostic messages and a prompt string for a password, if one is required. Diagnostic  
26569 messages may be written in cases where the exit status is not available. See the EXIT STATUS  
26570 section.

#### 26571 OUTPUT FILES

26572 None.

26573 **EXTENDED DESCRIPTION**

26574       None.

26575 **EXIT STATUS**

26576       If *newgrp* succeeds in creating a new shell execution environment, whether or not the group  
26577       identification was changed successfully, the exit status shall be the exit status of the shell.  
26578       Otherwise, the following exit value shall be returned:

26579       &gt;0   An error occurred.

26580 **CONSEQUENCES OF ERRORS**

26581       The invoking shell may terminate.

26582 **APPLICATION USAGE**

26583       There is no convenient way to enter a password into the Group Database. Use of group  
26584       passwords is not encouraged, because by their very nature they encourage poor security  
26585       practices. Group passwords may disappear in the future.

26586       A common implementation of *newgrp* is that the current shell uses *exec* to overlay itself with  
26587       *newgrp*, which in turn overlays itself with a new shell after changing group. On some systems,  
26588       however, this may not occur and *newgrp* may be invoked as a subprocess.

26589       The *newgrp* command is intended only for use from an interactive terminal. It does not offer a  
26590       useful interface for the support of applications.

26591       The exit status of *newgrp* is generally inapplicable. If *newgrp* is used in a script, in most cases it  
26592       successfully invokes a new shell and the rest of the original shell script is bypassed when the  
26593       new shell exits. Used interactively, *newgrp* displays diagnostic messages to indicate problems.  
26594       But usage such as:

26595       newgrp foo  
26596       echo \$?

26597       is not useful because the new shell might not have access to any status *newgrp* may have  
26598       generated (and most historical systems do not provide this status). A zero status echoed here  
26599       does not necessarily indicate that the user has changed to the new group successfully. Following  
26600       *newgrp* with the *id* command provides a portable means of determining whether the group  
26601       change was successful or not.

26602       Application writers should note that this utility need not be provided on systems that do not  
26603       support the User Portability Utilities option.

26604 **EXAMPLES**

26605       None.

26606 **RATIONALE**

26607       Most historical implementations use one of the *exec* functions to implement the behavior of  
26608       *newgrp*. Errors detected before the *exec* leave the environment unchanged, while errors detected  
26609       after the *exec* leave the user in a changed environment. While it would be useful to have *newgrp*  
26610       issue a diagnostic message to tell the user that the environment changed, it would be  
26611       inappropriate to require this change to some historical implementations.

26612       The password mechanism is allowed in the group database, but how this would be  
26613       implemented is not specified.

26614       The *newgrp* utility was retained in this volume of IEEE Std. 1003.1-200x, even given the existence  
26615       of the multiple group permissions feature in the System Interfaces volume of  
26616       IEEE Std. 1003.1-200x, for several reasons. First, in some systems, the group ownership of a  
26617       newly created file is determined by the group of the directory in which the file is created, as

26618 allowed by the System Interfaces volume of IEEE Std. 1003.1-200x; on other systems, the group  
26619 ownership of a newly created file is determined by the effective group ID. On systems of the  
26620 latter type, *newgrp* allows files to be created with a specific group ownership. Finally, many  
26621 systems use the real group ID in accounting, and on such systems, *newgrp* allows the accounting  
26622 identity of the user to be changed.

26623 **FUTURE DIRECTIONS**

26624 None.

26625 **SEE ALSO**

26626 *sh*, the System Interfaces volume of IEEE Std. 1003.1-200x, *exec*

26627 **CHANGE HISTORY**

26628 First released in Issue 2.

26629 **Issue 4**

26630 Aligned with the ISO/IEC 9945-2: 1993 standard.

26631 The *newgrp* utility is now mandatory; it is optional in Issue 3.

26632 **Issue 6**

26633 This utility is now marked as part of the User Portability Utilities option.

26634 The obsolescent SYNOPSIS is removed.

26635 The text describing supplemental groups is no longer conditional on {NGROUPS\_MAX} being  
26636 greater than 1. This is because {NGROUPS\_MAX} now has a minimum value of 8. This is a FIPS  
26637 requirement.

26638 **NAME**

26639       *nice* — invoke a utility with an altered nice value

26640 **SYNOPSIS**

26641 UP       *nice* [*-n increment*] *utility* [*argument...*]

26642

26643 **DESCRIPTION**

26644       The *nice* utility shall invoke a utility, requesting that it be run with a different nice value (see the  
26645       System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 3.245, Nice Value). With  
26646       no options and only if the user has appropriate privileges, the executed utility shall be run with a  
26647       nice value that is some implementation-dependent quantity less than or equal to the nice value  
26648       of the current process. If the user lacks appropriate privileges to affect the nice value in the  
26649       requested manner, the *nice* utility shall not affect the nice value; in this case, a warning message  
26650       may be written to standard error, but this shall not prevent the invocation of *utility* or affect the  
26651       exit status.

26652 **OPTIONS**

26653       The *nice* utility shall conform to the System Interface Definitions volume of  
26654       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

26655       The following option is supported:

26656       *-n increment* Specify how the nice value of the executed utility shall be adjusted. The *increment*  
26657       option-argument shall be a positive or negative decimal integer that shall be used  
26658       to modify the nice value of the executed utility in an implementation-dependent  
26659       manner.

26660       Positive *increment* values shall cause a lower or unchanged nice value. Negative  
26661       *increment* values may require appropriate privileges and shall cause a higher or  
26662       unchanged nice value.

26663       The nice value shall be bounded in an implementation-dependent manner. If the  
26664       requested *increment* would raise or lower the nice value of the executed utility  
26665       beyond implementation-dependent limits, then the limit whose value was  
26666       exceeded shall be used.

26667 **OPERANDS**

26668       The following operands shall be supported:

26669       *utility*       The name of a utility that is to be invoked. If the *utility* operand names any of the  
26670       special built-in utilities in Section 2.14 on page 96, the results are undefined.

26671       *argument*     Any string to be supplied as an argument when invoking the utility named by the  
26672       *utility* operand.

26673 **STDIN**

26674       Not used.

26675 **INPUT FILES**

26676       None.

26677 **ENVIRONMENT VARIABLES**

26678       The following environment variables shall affect the execution of *nice*:

26679       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
26680       If *LANG* is unset or null, the corresponding value from the implementation-  
26681       dependent default locale shall be used. If any of the internationalization variables  
26682       contains an invalid setting, the utility shall behave as if none of the variables had

| 26703 |                                                 | None.                                                                                                                            |
| 26704 | <b>EXTENDED DESCRIPTION</b>                     |                                                                                                                                  |
| 26705 |                                                 | None.                                                                                                                            |
| 26706 | <b>EXIT STATUS</b>                              |                                                                                                                                  |
| 26707 |                                                 | If the <i>utility</i> utility is invoked, the exit status of <i>nice</i> shall be the exit status of <i>utility</i> ; otherwise, |
| 26708 |                                                 | the <i>nice</i> utility shall exit with one of the following values:                                                             |
| 26709 | 1-125                                           | An error occurred in the <i>nice</i> utility.                                                                                    |
| 26710 | 126                                             | The utility specified by <i>utility</i> was found but could not be invoked.                                                      |
| 26711 | 127                                             | The utility specified by <i>utility</i> could not be found.                                                                      |
| 26712 | <b>CONSEQUENCES OF ERRORS</b>                   |                                                                                                                                  |
| 26713 |                                                 | Default.                                                                                                                         |
| 26714 | <b>APPLICATION USAGE</b>                        |                                                                                                                                  |
| 26715 |                                                 | The only guaranteed portable uses of this utility are:                                                                           |
| 26716 | <i>nice utility</i>                             |                                                                                                                                  |
| 26717 |                                                 | Run <i>utility</i> with the default lower nice value.                                                                            |
| 26718 | <i>nice -n &lt;positive integer&gt; utility</i> |                                                                                                                                  |
| 26719 |                                                 | Run <i>utility</i> with a lower nice value.                                                                                      |
| 26720 |                                                 | On some systems they have no discernible effect on the invoked utility and on some others they                                   |
| 26721 |                                                 | are exactly equivalent.                                                                                                          |
| 26722 |                                                 | Historical systems have frequently supported the <i>&lt;positive integer&gt;</i> up to 20. Since there is no                     |
| 26723 |                                                 | error penalty associated with guessing a number that is too high, users without access to the                                    |
| 26724 |                                                 | system conformance document (to see what limits are actually in place) could use the historical                                  |
| 26725 |                                                 | 1 to 20 range or attempt to use very large numbers if the job should be truly low priority.                                      |

26726 The nice value of a process can be displayed using the command:

26727 `ps -o nice`

26728 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
26729 an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
26730 utility exited with an error indication”. The value 127 was chosen because it is not commonly  
26731 used for other meanings; most utilities use small values for “normal error conditions” and the  
26732 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
26733 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
26734 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
26735 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
26736 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
26737 any other reason.

26738 Application writers should note that this utility need not be provided on systems that do not  
26739 support the User Portability Utilities option.

#### 26740 EXAMPLES

26741 None.

#### 26742 RATIONALE

26743 Due to the text about the limits of the nice value being implementation-dependent, *nice* is not  
26744 actually required to change the nice value of the executed command; the limits could be zero  
26745 differences from the system default, although the implementor is required to document this fact  
26746 in the conformance document.

26747 The 4.3 BSD version of *nice* does not check if *increment* is a valid decimal integer. The command  
26748 *nice -x utility*, for example, would be treated the same as the command *nice --1 utility*. If the  
26749 user does not have appropriate privileges, this results in a “permission denied” error. This is  
26750 considered a bug.

26751 When a user without appropriate privileges gives a negative *increment*, System V treats it like  
26752 the command *nice -0 utility*, while 4.3 BSD writes a “permission denied” message and does not  
26753 run the utility. Neither was considered clearly superior, so the behavior was left unspecified.

26754 The C shell has a built-in version of *nice* that has a different interface from the one described in  
26755 this volume of IEEE Std. 1003.1-200x.

26756 The term “utility” is used, rather than “command”, to highlight the fact that shell compound  
26757 commands, pipelines, and so on, cannot be used. Special built-ins also cannot be used.  
26758 However, “utility” includes user application programs and shell scripts, not just utilities defined  
26759 in this volume of IEEE Std. 1003.1-200x.

26760 Historical implementations of *nice* provide a nice value range of 40 or 41 discrete steps, with the  
26761 default nice value being the midpoint of that range. By default, they lower the nice value of the  
26762 executed utility by 10.

26763 Some historical documentation states that the *increment* value must be within a fixed range. This  
26764 is misleading; the valid *increment* values on any invocation are determined by the current  
26765 process nice value, which is not always the default.

26766 The definition of nice value is not intended to suggest that all processes in a system have  
26767 priorities that are comparable. Scheduling policy extensions such as the realtime priorities in  
26768 POSIX.4 make the notion of a single underlying priority for all scheduling policies problematic.  
26769 Some systems may implement the *nice* **-related** features to affect all processes on the system,  
26770 others to affect just the general time-sharing activities implied by this volume of  
26771 IEEE Std. 1003.1-200x, and others may have no effect at all. Because of the use of

26772 “implementation-dependent” in *nice* and *renice*, a wide range of implementation strategies are  
26773 possible.

26774 **FUTURE DIRECTIONS**

26775 None.

26778 **CHANGE HISTORY**

26779 First released in Issue 4.

26780 **Issue 6**

26781 This utility is now marked as part of the User Portability Utilities option.

26782 The obsolescent SYNOPSIS is removed.

## 26783 NAME

26784 nl — line numbering filter

## 26785 SYNOPSIS

```
26786 xsi nl [-p][-b type][-d delim][-f type][-h type][-i incr][-l num][-n format]
26787 [-s sep][-v startnum][-w width][file]
26788
```

## 26789 DESCRIPTION

26790 The *nl* utility shall read lines from the named *file* or the standard input if no *file* is named and  
 26791 shall reproduce the lines to standard output. Lines shall be numbered on the left. Additional  
 26792 functionality may be provided in accordance with the command options in effect.

26793 The *nl* utility views the text it reads in terms of logical pages. Line numbering is reset at the start  
 26794 of each logical page. A logical page consists of a header, a body, and a footer section. Empty  
 26795 sections are valid. Different line numbering options are independently available for header,  
 26796 body, and footer (for example, no numbering of header and footer lines while numbering blank  
 26797 lines only in the body).

26798 The starts of logical page sections are signaled by input lines containing nothing but the  
 26799 following delimiter characters:

26800

26801

26802

26803

| Line     | Start of |
|----------|----------|
| \: \: \: | Header   |
| \: \:    | Body     |
| \:       | Footer   |

26804 Unless otherwise specified, *nl* assumes the text being read is in a single logical page body.

## 26805 OPTIONS

26806 The *nl* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 26807 Section 12.2, Utility Syntax Guidelines. Only one file can be named.

26808 The following options shall be supported:

26809 **-b type** Specify which logical page body lines shall be numbered. Recognized *types* and  
 26810 their meaning are:

26811 **a** Number all lines.

26812 **t** Number only non-empty lines.

26813 **n** No line numbering.

26814 **pstring** Number only lines that contain the basic regular expression specified in  
 26815 *string*.

26816 The default *type* for logical page body is **t** (text lines numbered).

26817 **-d delim** Specify the delimiter characters that indicate the start of a logical page section.  
 26818 These can be changed from the default characters "\:" to two user-specified  
 26819 characters. If only one character is entered, the second character remains the  
 26820 default character ' '.

26821 **-f type** Specify the same as **b type** except for footer. The default for logical page footer is **n**  
 26822 (no lines numbered).

26823 **-h type** Specify the same as **b type** except for header. The default *type* for logical page  
 26824 header is **n** (no lines numbered).

|       |                    |                                                                                                                                                                                                                                                                                   |
|-------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26825 | <b>-i incr</b>     | Specify the increment value used to number logical page lines. The default is 1.                                                                                                                                                                                                  |
| 26826 | <b>-l num</b>      | Specify the number of blank lines to be considered as one. For example, <b>-l 2</b> results in only the second adjacent blank line being numbered (if the appropriate <b>-h a</b> , <b>-b a</b> , or <b>-f a</b> option is set). The default is 1.                                |
| 26827 |                    |                                                                                                                                                                                                                                                                                   |
| 26828 |                    |                                                                                                                                                                                                                                                                                   |
| 26829 | <b>-n format</b>   | Specify the line numbering format. Recognized values are: <b>ln</b> , left justified, leading zeros suppressed; <b>rn</b> , right justified, leading zeros suppressed; <b>rz</b> , right justified, leading zeros kept. The default <i>format</i> is <b>rn</b> (right justified). |
| 26830 |                    |                                                                                                                                                                                                                                                                                   |
| 26831 |                    |                                                                                                                                                                                                                                                                                   |
| 26832 | <b>-p</b>          | Specify that numbering should not be restarted at logical page delimiters.                                                                                                                                                                                                        |
| 26833 | <b>-s sep</b>      | Specify the characters used in separating the line number and the corresponding text line. The default <i>sep</i> is a <tab>.                                                                                                                                                     |
| 26834 |                    |                                                                                                                                                                                                                                                                                   |
| 26835 | <b>-v startnum</b> | Specify the initial value used to number logical page lines. The default is 1.                                                                                                                                                                                                    |
| 26836 | <b>-w width</b>    | Specify the number of characters to be used for the line number. The default <i>width</i> is 6.                                                                                                                                                                                   |
| 26837 |                    |                                                                                                                                                                                                                                                                                   |

#### 26838 OPERANDS

26839 The following operand shall be supported:

26840 *file* A path name of a text file to be line-numbered.

#### 26841 STDIN

26842 The standard input is a text file that is used if no *file* operand is given.

#### 26843 INPUT FILES

26844 The input file named by the *file* operand is a text file.

#### 26845 ENVIRONMENT VARIABLES

26846 The following environment variables shall affect the execution of *nl*:

26847 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 26848 If *LANG* is unset or null, the corresponding value from the implementation-  
 26849 dependent default locale shall be used. If any of the internationalization variables  
 26850 contains an invalid setting, the utility shall behave as if none of the variables had  
 26851 been defined.

26852 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 26853 internationalization variables.

26854 *LC\_COLLATE*  
 26855 Determine the locale for the behavior of ranges, equivalence classes and multi-  
 26856 character collating elements within regular expressions.

26857 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 26858 characters (for example, single-byte as opposed to multi-byte characters in  
 26859 arguments and input files), the behavior of character classes within regular  
 26860 expressions, and for deciding which characters are in character class **graph** (for the  
 26861 **-b t**, **-f t**, and **-h t** options).

26862 *LC\_MESSAGES*  
 26863 Determine the locale that should be used to affect the format and contents of  
 26864 diagnostic messages written to standard error.

26865 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**26866 ASYNCHRONOUS EVENTS**

26867 Default.

**26868 STDOUT**

26869 The standard output shall be a text file in the following format:

26870 "%s%s%s", <line number>, <separator>, <input line>

26871 where <line number> is one of the following numeric formats:

26872 %6d When the **rn** format is used (the default; see **-n**).

26873 %06d When the **rz** format is used.

26874 %-6d When the **ln** format is used.

26875 <empty> When line numbers are suppressed for a portion of the page; the <separator> is also  
26876 suppressed.

26877 In the preceding list, the number 6 is the default width; the **-w** option can change this value.

**26878 STDERR**

26879 Used only for diagnostic messages.

**26880 OUTPUT FILES**

26881 None.

**26882 EXTENDED DESCRIPTION**

26883 None.

**26884 EXIT STATUS**

26885 The following exit values shall be returned:

26886 0 Successful completion.

26887 >0 An error occurred.

**26888 CONSEQUENCES OF ERRORS**

26889 Default.

**26890 APPLICATION USAGE**

26891 In using the **-d delim** option, care should be taken to escape characters that have special meaning  
26892 to the command interpreter.

**26893 EXAMPLES**

26894 The command:

26895 nl -v 10 -i 10 -d \!+ file1

26896 numbers *file1* starting at line number 10 with an increment of 10. The logical page delimiter is  
26897 " !+ ". Note that the ' ! ' has to be escaped when using *csh* as a command interpreter because of  
26898 its history substitution syntax. For *ksh* and *sh* the escape is not necessary, but does not do any  
26899 harm.

**26900 RATIONALE**

26901 None.

**26902 FUTURE DIRECTIONS**

26903 The intermingling of the *file* operand with the options is an obsolescent feature that is removed  
26904 from a future issue.

26905 **SEE ALSO**26906 *pr*26907 **CHANGE HISTORY**

26908 First released in Issue 2.

26909 **Issue 4**

26910 Format reorganized.

26911 Utility Syntax Guideline support mandated.

26912 Internationalized environment variable support mandated.

26913 **Issue 5**26914 The option `[-f type]` is added to the SYNOPSIS. The option descriptions are presented in  
26915 alphabetic order. The description of `-bt` is changed to “Number only non-empty lines”.26916 **Issue 6**26917 The obsolescent behavior allowing the options to be intermingled with the optional *file* operand  
26918 is removed.

26919 **NAME**26920 nm — write the name list of an object file (**DEVELOPMENT**)26921 **SYNOPSIS**26922 UP SD XSI nm [-APv][-efox][-g|-u][-t *format*] *file...*

26923

26924 **DESCRIPTION**

26925 This utility shall be provided on systems that support both the User Portability Utilities option  
 26926 and the Software Development Utilities option. On other systems it is optional. Certain options  
 26927 are only available on XSI-conformant systems.

26928 The *nm* utility shall display symbolic information appearing in the object file, executable file or  
 26929 object-file library named by *file*. If no symbolic information is available for a valid input file, the  
 26930 *nm* utility shall report that fact, but not consider it an error condition.

26931 XSI The default base used when numeric values are written is **decimal**.

26932 **OPTIONS**

26933 The *nm* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 26934 Section 12.2, Utility Syntax Guidelines.

26935 The following options shall be supported:

26936 **-A** Write the full path name or library name of an object on each line.

26937 XSI **-e** Write only external (global) and static symbol information.

26938 XSI **-f** Produce full output. Write redundant symbols (**.text**, **.data**, and **.bss**), normally  
 26939 suppressed.

26940 **-g** Write only external (global) symbol information.

26941 XSI **-o** Write numeric values in octal (equivalent to **-t o**).

26942 **-P** Write information in a portable output format, as specified in the STDOUT section.

26943 **-t format** Write each numeric value in the specified format. The format shall be dependent  
 26944 on the single character used as the *format* option-argument:

26945 XSI d The offset is written in decimal (**default**).

26946 o The offset is written in octal.

26947 x The offset is written in hexadecimal.

26948 **-u** Write only undefined symbols.

26949 **-v** Sort output by value instead of alphabetically.

26950 XSI **-x** Write numeric values in hexadecimal (equivalent to **-t x**).

26951 **OPERANDS**

26952 The following operand shall be supported:

26953 *file* A path name of an object file, executable file, or object-file library.

26954 **STDIN**

26955 See the INPUT FILES section.

26956 **INPUT FILES**

26957       The input file shall be an object file, an object-file library whose format is the same as those  
 26958       produced by the *ar* utility for link editing, or an executable file. The *nm* utility may accept  
 26959       additional implementation-dependent object library formats for the input file.

26960 **ENVIRONMENT VARIABLES**

26961       The following environment variables shall affect the execution of *nm*:

26962       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 26963       If *LANG* is unset or null, the corresponding value from the implementation-  
 26964       dependent default locale shall be used. If any of the internationalization variables  
 26965       contains an invalid setting, the utility shall behave as if none of the variables had  
 26966       been defined.

26967       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 26968       internationalization variables.

26969       *LC\_COLLATE* Determine the locale for character collation information for the symbol-name and  
 26970       symbol-value collation sequences.  
 26971

26972       *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 26973       characters (for example, single-byte as opposed to multi-byte characters in  
 26974       arguments).

26975       *LC\_MESSAGES* Determine the locale that should be used to affect the format and contents of  
 26976       diagnostic messages written to standard error.  
 26977

26978 XSI       *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

26979 **ASYNCHRONOUS EVENTS**

26980       Default.

26981 **STDOUT**

26982       If symbolic information is present in the input files, then for each file or for each member of an  
 26983       archive, the *nm* utility shall write the following information to standard output. By default, the  
 26984       format is unspecified, but the output shall be sorted alphabetically by symbol name:

- 26985       • Library or object name, if *-A* is specified
- 26986       • Symbol name
- 26987       • Symbol type, which shall either be one of the following single characters or an  
 26988       implementation-dependent type represented by a single character:
- 26989       A   Global absolute symbol.
- 26990       a   Local absolute symbol.
- 26991       B   Global “bss” (that is, uninitialized data space) symbol.
- 26992       b   Local bss symbol.
- 26993       D   Global data symbol.
- 26994       d   Local data symbol.
- 26995       T   Global text symbol.
- 26996       t   Local text symbol.

26997           U    Undefined symbol.

26998           • Value of the symbol

26999           • The size associated with the symbol, if applicable

27000       This information may be supplemented by additional information specific to the  
27001       implementation.

27002       If the **-P** option is specified, the previous information shall be displayed using the following  
27003       portable format. The three versions differ depending on whether **-t d**, **-t o**, or **-t x** was specified,  
27004       respectively:

27005       "%s%s %s %d %d\n", <library/object name>, <name>, <type>,  
27006       <value>, <size>

27007       "%s%s %s %o %o\n", <library/object name>, <name>, <type>,  
27008       <value>, <size>

27009       "%s%s %s %x %x\n", <library/object name>, <name>, <type>,  
27010       <value>, <size>

27011       where

27012       <library/object name> shall be formatted as follows:

27013       • If **-A** is not specified, <library/object name> shall be an empty string.

27014       • If **-A** is specified and the corresponding *file* operand does not name a library:

27015       "%s: ", <file>

27016       • If **-A** is specified and the corresponding *file* operand names a library. In this case, <object file>  
27017       shall name the object file in the library containing the symbol being described:

27018       "%s[%s]: ", <file>, <object file>

27019       If **-A** is not specified, then if more than one *file* operand is specified or if only one *file* operand is  
27020       specified and it names a library, *nm* shall write a line identifying the object containing the  
27021       following symbols before the lines containing those symbols, in the form:

27022       • If the corresponding *file* operand does not name a library:

27023       "%s:\n", <file>

27024       • If the corresponding *file* operand names a library; in this case, <object file> shall be the name  
27025       of the file in the library containing the following symbols:

27026       "%s[%s]:\n", <file>, <object file>

27027       If **-P** is specified, but **-t** is not, the format shall be as if **-t x** had been specified.

27028   **STDERR**

27029       Used only for diagnostic messages.

27030   **OUTPUT FILES**

27031       None.

27032   **EXTENDED DESCRIPTION**

27033       None.

**27034 EXIT STATUS**

27035           The following exit values shall be returned:

27036           0   Successful completion.

27037           >0   An error occurred.

**27038 CONSEQUENCES OF ERRORS**

27039           Default.

**27040 APPLICATION USAGE**

27041           Mechanisms for dynamic linking make this utility less meaningful when applied to an  
27042           executable file because a dynamically linked executable may omit numerous library routines  
27043           that would be found in a statically linked executable.

**27044 EXAMPLES**

27045           None.

**27046 RATIONALE**

27047           Historical implementations of *nm* have used different bases for numeric output and supplied  
27048           different default types of symbols that were reported. The *-t format* option, similar to that used  
27049           in *od* and *strings*, can be used to specify the numeric base; *-g* and *-u* can be used to restrict the  
27050           amount of output or the types of symbols included in the output.

27051           The option list was significantly reduced from that provided by historical implementations.

27052           The *nm* description is a subset of both the System V and BSD *nm* utilities with no specified  
27053           default output.

27054           It was recognized that mechanisms for dynamic linking make this utility less meaningful when  
27055           applied to an executable file (because a dynamically linked executable file may omit numerous  
27056           library routines that would be found in a statically linked executable file), but the value of *nm*  
27057           during software development was judged to outweigh other limitations.

27058           The compromise of using *-t format* versus using *-d*, *-o*, and other similar options was necessary  
27059           because of differences in the meaning of *-o* between implementations. The *-o* option from BSD  
27060           has been provided here as *-A* to avoid confusion with the *-o* from System V (which has been  
27061           provided here as *-t* and as *-o* on XSI-conformant systems).

27062           The default output format of *nm* is not specified because of differences in historical  
27063           implementations. The *-P* option was added to allow some type of portable output format. After  
27064           a comparison of the different formats used in SunOS, BSD, SVR3, and SVR4, it was decided to  
27065           create one that did not match the current format of any of these four systems. The format  
27066           devised is easy to parse by humans, easy to parse in shell scripts, and does not need to vary  
27067           depending on locale (because no English descriptions are included). All of the systems currently  
27068           have the information available to use this format.

27069           The format given in *nm* STDOUT uses spaces between the fields, which may be any number of  
27070           <blank>s required to align the columns. The single-character types were selected to match  
27071           historical practice, and the requirement that implementation additions also be single characters  
27072           made parsing the information easier for shell scripts.

**27073 FUTURE DIRECTIONS**

27074           None.

**27075 SEE ALSO**

27076           *ar*, *c89*

27077 **CHANGE HISTORY**

27078 First released in Issue 2.

27079 **Issue 4**

27080 Aligned with the ISO/IEC 9945-2: 1993 standard.

27081 **Issue 6**27082 This utility is now marked as supported when both the User Portability Utilities option and the  
27083 Software Development Utilities option are supported.

27084 **NAME**

27085           nohup — invoke a utility immune to hangups

27086 **SYNOPSIS**27087           nohup *utility* [*argument...*]27088 **DESCRIPTION**

27089           The *nohup* utility shall invoke the utility named by the *utility* operand with arguments supplied  
 27090           as the *argument* operands. At the time the named *utility* is invoked, the SIGHUP signal shall be  
 27091           set to be ignored.

27092           If the standard output is a terminal, all output written by the named *utility* to its standard output  
 27093           shall be appended to the end of the file **nohup.out** in the current directory. If **nohup.out** cannot  
 27094           be created or opened for appending, the output shall be appended to the end of the file  
 27095           **nohup.out** in the directory specified by the *HOME* environment variable. If neither file can be  
 27096           created or opened for appending, *utility* shall not be invoked. If a file is created, the file's  
 27097           permission bits shall be set to S\_IRUSR | S\_IWUSR.

27098           If the standard error is a terminal, all output written by the named *utility* to its standard error  
 27099           shall be redirected to the same file descriptor as the standard output.

27100 **OPTIONS**

27101           None.

27102 **OPERANDS**

27103           The following operands shall be supported:

27104           *utility*       The name of a utility that is to be invoked. If the *utility* operand names any of the  
 27105           special built-in utilities in Section 2.14 on page 96, the results are undefined.

27106           *argument*   Any string to be supplied as an argument when invoking the utility named by the  
 27107           *utility* operand.

27108 **STDIN**

27109           Not used.

27110 **INPUT FILES**

27111           None.

27112 **ENVIRONMENT VARIABLES**27113           The following environment variables shall affect the execution of *nohup*:

27114           *HOME*       Determine the path name of the user's home directory; if the output file **nohup.out**  
 27115           cannot be created in the current directory, the *nohup* utility shall use the directory  
 27116           named by *HOME* to create the file.

27117           *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 27118           If *LANG* is unset or null, the corresponding value from the implementation-  
 27119           dependent default locale shall be used. If any of the internationalization variables  
 27120           contains an invalid setting, the utility behave as if none of the variables had been  
 27121           defined.

27122           *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 27123           internationalization variables.

27124           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 27125           characters (for example, single-byte as opposed to multi-byte characters in  
 27126           arguments).

|       |                               |                                                                                                                                                     |
|-------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 27127 | <i>LC_MESSAGES</i>            |                                                                                                                                                     |
| 27128 |                               | Determine the locale that should be used to affect the format and contents of                                                                       |
| 27129 |                               | diagnostic messages written to standard error.                                                                                                      |
| 27130 | XSI <i>NLSPATH</i>            | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                               |
| 27131 | <i>PATH</i>                   | Determine the search path that is used to locate the utility to be invoked. See the                                                                 |
| 27132 |                               | System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 8,                                                                            |
| 27133 |                               | Environment Variables.                                                                                                                              |
| 27134 | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                                                     |
| 27135 |                               | The <i>nohup</i> utility shall take the standard action for all signals except that SIGHUP shall be                                                 |
| 27136 |                               | ignored.                                                                                                                                            |
| 27137 | <b>STDOUT</b>                 |                                                                                                                                                     |
| 27138 |                               | If the standard output is not a terminal, the standard output of <i>nohup</i> shall be the standard                                                 |
| 27139 |                               | output generated by the execution of the <i>utility</i> specified by the operands. Otherwise, nothing                                               |
| 27140 |                               | shall be written to the standard output.                                                                                                            |
| 27141 | <b>STDERR</b>                 |                                                                                                                                                     |
| 27142 |                               | If the standard output is a terminal, a message shall be written to the standard error, indicating                                                  |
| 27143 |                               | the name of the file to which the output is being appended. The name of the file shall be either                                                    |
| 27144 |                               | <b>nohup.out</b> or <b>\$HOME/nohup.out</b> .                                                                                                       |
| 27145 | <b>OUTPUT FILES</b>           |                                                                                                                                                     |
| 27146 |                               | If the standard output is a terminal, all output written by the named <i>utility</i> to the standard                                                |
| 27147 |                               | output and standard error is appended to the file <b>nohup.out</b> , which is created if it does not                                                |
| 27148 |                               | already exist.                                                                                                                                      |
| 27149 | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                                                     |
| 27150 |                               | None.                                                                                                                                               |
| 27151 | <b>EXIT STATUS</b>            |                                                                                                                                                     |
| 27152 |                               | The following exit values shall be returned:                                                                                                        |
| 27153 | 126                           | The utility specified by <i>utility</i> was found but could not be invoked.                                                                         |
| 27154 | 127                           | An error occurred in the <i>nohup</i> utility or the utility specified by <i>utility</i> could not be                                               |
| 27155 |                               | found.                                                                                                                                              |
| 27156 |                               | Otherwise, the exit status of <i>nohup</i> shall be that of the utility specified by the <i>utility</i> operand.                                    |
| 27157 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                     |
| 27158 |                               | Default.                                                                                                                                            |
| 27159 | <b>APPLICATION USAGE</b>      |                                                                                                                                                     |
| 27160 |                               | The <i>command</i> , <i>env</i> , <i>nice</i> , <i>nohup</i> , <i>time</i> , and <i>xargs</i> utilities have been specified to use exit code 127 if |
| 27161 |                               | an error occurs so that applications can distinguish “failure to find a utility” from “invoked                                                      |
| 27162 |                               | utility exited with an error indication”. The value 127 was chosen because it is not commonly                                                       |
| 27163 |                               | used for other meanings; most utilities use small values for “normal error conditions” and the                                                      |
| 27164 |                               | values above 128 can be confused with termination due to receipt of a signal. The value 126 was                                                     |
| 27165 |                               | chosen in a similar manner to indicate that the utility could be found, but not invoked. Some                                                       |
| 27166 |                               | scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction                                                    |
| 27167 |                               | between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to                                                    |
| 27168 |                               | <i>exec</i> the utility fail with [ENOENT], and uses 126 when any attempt to <i>exec</i> the utility fails for                                      |
| 27169 |                               | any other reason.                                                                                                                                   |

27170 **EXAMPLES**

27171 It is frequently desirable to apply *nohup* to pipelines or lists of commands. This can be done by  
27172 placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
27173 the *nohup* applies to everything in the file.

27174 Alternatively, the following command can be used to apply *nohup* to a complex command:

27175 `nohup sh -c 'complex-command-line'`

27176 **RATIONALE**

27177 The 4.3 BSD version ignores SIGTERM and SIGHUP, and if `./nohup.out` cannot be used, it fails  
27178 instead of trying to use `$HOME/nohup.out`.

27179 The *cs*h utility has a built-in version of *nohup* that acts differently from the POSIX Shell and  
27180 Utilities *nohup*.

27181 The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
27182 commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*  
27183 includes user application programs and shell scripts, not just the standard utilities.

27184 Historical versions of the *nohup* utility use default file creation semantics. Some more recent  
27185 versions use the permissions specified here as an added security precaution.

27186 Some historical implementations ignore SIGQUIT in addition to SIGHUP; others ignore  
27187 SIGTERM. An early proposal allowed, but did not require, SIGQUIT to be ignored. Several  
27188 reviewers objected that *nohup* should only modify the handling of SIGHUP as required by this  
27189 volume of IEEE Std. 1003.1-200x.

27190 **FUTURE DIRECTIONS**

27191 None.

27192 **SEE ALSO**

27194 **CHANGE HISTORY**

27195 First released in Issue 2.

27196 **Issue 4**

27197 Aligned with the ISO/IEC 9945-2:1993 standard.

27198 **NAME**

27199       od — dump files in various formats

27200 **SYNOPSIS**

27201       od [-v][-A *address\_base*][-j *skip*][-N *count*][-t *type\_string*]...  
 27202       [*file*...]

27203 XSI       od [-bcdosx][*file*] [[+]offset[.][b]]

27204

27205 **DESCRIPTION**

27206       The *od* utility shall write the contents of its input files to standard output in a user-specified  
 27207       format.

27208 **OPTIONS**

27209       The *od* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 27210 XSI       Section 12.2, Utility Syntax Guidelines, except that the order of presentation of the **-t** options  
 27211       and the **-bcdosx** options is significant.

27212       The following options shall be supported:

27213       **-A** *address\_base*

27214               Specify the input offset base. See the EXTENDED DESCRIPTION section. The  
 27215               application shall ensure that the *address\_base* option-argument is a character. The  
 27216               characters 'd', 'o', and 'x' specify that the offset base shall be written in  
 27217               decimal, octal, or hexadecimal, respectively. The character 'n' specifies that the  
 27218               offset shall not be written.

27219 XSI       **-b**       Interpret bytes in octal. This is equivalent to **-t o1**.

27220 XSI       **-c**       Interpret bytes as characters specified by the current setting of the *LC\_CTYPE*  
 27221               category. Certain non-graphic characters appear as C escapes: "NUL=\0",  
 27222               "BS=\b", "FF=\f", "NL=\n", "CR=\r", "HT=\t"; others appear as 3-digit octal  
 27223               numbers.

27224 XSI       **-d**       Interpret *words* (two-byte units) in unsigned decimal. This is equivalent to **-t u2**.

27225       **-j** *skip*       Jump over *skip* bytes from the beginning of the input. The *od* utility shall read or  
 27226               seek past the first *skip* bytes in the concatenated input files. If the combined input  
 27227               is not at least *skip* bytes long, the *od* utility shall write a diagnostic message to  
 27228               standard error and exit with a non-zero exit status.

27229               By default, the *skip* option-argument shall be interpreted as a decimal number.  
 27230               With a leading "0x" or "0X", the offset shall be interpreted as a hexadecimal  
 27231               number; otherwise, with a leading '0', the offset shall be interpreted as an octal  
 27232               number. Appending the character 'b', 'k', or 'm' to offset shall cause it to be  
 27233 XSI               interpreted as a multiple of 512, 1024, or 1048576 bytes, respectively. If the *skip*  
 27234               number is hexadecimal, any appended 'b' shall be considered to be the final  
 27235               hexadecimal digit.

27236       **-N** *count*       Format no more than *count* bytes of input. By default, *count* shall be interpreted as  
 27237               a decimal number. With a leading "0x" or "0X", *count* shall be interpreted as a  
 27238               hexadecimal number; otherwise, with a leading '0', it shall be interpreted as an  
 27239               octal number. If *count* bytes of input (after successfully skipping, if **-j** *skip* is  
 27240               specified) are not available, it shall not be considered an error; the *od* utility shall  
 27241               format the input that is available.

27242 XSI       **-o**       Interpret *words* (two-byte units) in octal. This is equivalent to **-t o2**.

|       |     |                                      |                                                                                                                                            |
|-------|-----|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 27243 | XSI | <b>-s</b>                            | Interpret <i>words</i> (two-byte units) in signed decimal. This is equivalent to <b>-t d2</b> .                                            |
| 27244 |     | <b>-t <i>type_string</i></b>         |                                                                                                                                            |
| 27245 |     |                                      | Specify one or more output types. See the EXTENDED DESCRIPTION section. The                                                                |
| 27246 |     |                                      | application shall ensure that the <i>type_string</i> option-argument is a string specifying                                                |
| 27247 |     |                                      | the types to be used when writing the input data. The string shall consist of the                                                          |
| 27248 |     |                                      | type specification characters <b>a</b> , <b>c</b> , <b>d</b> , <b>f</b> , <b>o</b> , <b>u</b> , and <b>x</b> , specifying named character, |
| 27249 |     |                                      | character, signed decimal, floating point, octal, unsigned decimal, and                                                                    |
| 27250 |     |                                      | hexadecimal, respectively. The type specification characters <b>d</b> , <b>f</b> , <b>o</b> , <b>u</b> , and <b>x</b> can be               |
| 27251 |     |                                      | followed by an optional unsigned decimal integer that specifies the number of                                                              |
| 27252 |     |                                      | bytes to be transformed by each instance of the output type. The type specification                                                        |
| 27253 |     |                                      | character <b>f</b> can be followed by an optional <b>F</b> , <b>D</b> , or <b>L</b> indicating that the conversion                         |
| 27254 |     |                                      | should be applied to an item of type <b>float</b> , <b>double</b> , or <b>long double</b> , respectively.                                  |
| 27255 |     |                                      | The type specification characters <b>d</b> , <b>o</b> , <b>u</b> and <b>x</b> can be followed by an optional <b>C</b> , <b>S</b> ,         |
| 27256 |     |                                      | <b>I</b> , or <b>L</b> indicating that the conversion should be applied to an item of type <b>char</b> ,                                   |
| 27257 |     |                                      | <b>short</b> , <b>int</b> , or <b>long</b> , respectively. Multiple types can be concatenated within the                                   |
| 27258 |     |                                      | same <i>type_string</i> and multiple <b>-t</b> options can be specified. Output lines shall be                                             |
| 27259 |     |                                      | written for each type specified in the order in which the type specification                                                               |
| 27260 |     |                                      | characters are specified.                                                                                                                  |
| 27261 |     | <b>-v</b>                            | Write all input data. Without the <b>-v</b> option, any number of groups of output lines,                                                  |
| 27262 |     |                                      | which would be identical to the immediately preceding group of output lines                                                                |
| 27263 |     |                                      | (except for the byte offsets), shall be replaced with a line containing only an                                                            |
| 27264 |     |                                      | asterisk ( <b>' * '</b> ).                                                                                                                 |
| 27265 | XSI | <b>-x</b>                            | Interpret <i>words</i> (two-byte units) in hexadecimal. This is equivalent to <b>-t x2</b> .                                               |
| 27266 | XSI |                                      | Multiple types can be specified by using multiple <b>-bcdostx</b> options. Output lines are written for                                    |
| 27267 |     |                                      | each type specified in the order in which the types are specified.                                                                         |
| 27268 |     | <b>OPERANDS</b>                      |                                                                                                                                            |
| 27269 |     |                                      | The following operands shall be supported:                                                                                                 |
| 27270 |     | <b>file</b>                          | A path name of a file to be read. If no file operands are specified, the standard                                                          |
| 27271 |     |                                      | input shall be used. If the first character of <i>file</i> is a plus sign ( <b>' + '</b> ) or the first                                    |
| 27272 |     |                                      | character of the first file operand is numeric, no more than two operands are given,                                                       |
| 27273 | XSI |                                      | and none of the <b>-A</b> , <b>-j</b> , <b>-N</b> , or <b>-t</b> options is specified, the operand is assumed to be                        |
| 27274 |     |                                      | an <i>offset</i> .                                                                                                                         |
| 27275 | XSI | <b>[+]<i>offset</i>[.][<i>b</i>]</b> |                                                                                                                                            |
| 27276 |     |                                      | The <i>offset</i> operand specifies the offset in the file where dumping is to commence.                                                   |
| 27277 |     |                                      | This operand is normally interpreted as octal bytes. If <b>' . '</b> is appended, the offset                                               |
| 27278 |     |                                      | shall be interpreted in decimal. If <b>' b '</b> is appended, the offset shall be interpreted                                              |
| 27279 |     |                                      | in units of 512 bytes. If the <i>file</i> argument is omitted, and none of the <b>-A</b> , <b>-j</b> , <b>-N</b> , or                      |
| 27280 |     |                                      | <b>-t</b> options is specified, the application shall ensure that the offset argument is                                                   |
| 27281 |     |                                      | preceded by <b>' + '</b> .                                                                                                                 |
| 27282 |     | <b>STDIN</b>                         |                                                                                                                                            |
| 27283 |     |                                      | The standard input shall be used only if no <i>file</i> operands are specified. See the INPUT FILES                                        |
| 27284 |     |                                      | section.                                                                                                                                   |
| 27285 |     | <b>INPUT FILES</b>                   |                                                                                                                                            |
| 27286 |     |                                      | The input files can be any file type.                                                                                                      |

27287 **ENVIRONMENT VARIABLES**

27288 The following environment variables shall affect the execution of *od*:

27289 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 27290 If *LANG* is unset or null, the corresponding value from the implementation-  
 27291 dependent default locale shall be used. If any of the internationalization variables  
 27292 contains an invalid setting, the utility shall behave as if none of the variables had  
 27293 been defined.

27294 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 27295 internationalization variables.

27296 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 27297 characters (for example, single-byte as opposed to multi-byte characters in  
 27298 arguments and input files).

27299 **LC\_MESSAGES**  
 27300 Determine the locale that should be used to affect the format and contents of  
 27301 diagnostic messages written to standard error.

27302 **LC\_NUMERIC**  
 27303 Determine the locale for selecting the radix character used when writing floating-  
 27304 point formatted output.

27305 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

27306 **ASYNCHRONOUS EVENTS**

27307 Default.

27308 **STDOUT**

27309 See the EXTENDED DESCRIPTION section.

27310 **STDERR**

27311 Used only for diagnostic messages.

27312 **OUTPUT FILES**

27313 None.

27314 **EXTENDED DESCRIPTION**

27315 The *od* utility shall copy sequentially each input file to standard output, transforming the input  
 27316 XSI data according to the output types specified by the **-t** options or the **-bcdosx** options. If no  
 27317 output type is specified, the default output shall be as if **-t oS** had been specified.

27318 The number of bytes transformed by the output type specifier *c* may be variable depending on  
 27319 the *LC\_CTYPE* category.

27320 The default number of bytes transformed by output type specifiers **d**, **f**, **o**, **u**, and **x** corresponds  
 27321 to the various C-language types as follows. If the *c89* compiler is present on the system, these  
 27322 specifiers shall correspond to the sizes used by default in that compiler. Otherwise, these sizes  
 27323 may vary among systems that conform to IEEE Std. 1003.1-200x.

- 27324 • For the type specifier characters **d**, **o**, **u**, and **x**, the default number of bytes shall correspond
- 27325 to the size of the underlying implementation's basic integral data type. For these specifier
- 27326 characters, the implementation shall support values of the optional number of bytes to be
- 27327 converted corresponding to the number of bytes in the C-language types **char**, **short**, **int**, and
- 27328 **long**. These numbers can also be specified by an application as the characters **'C'**, **'S'**, **'I'**,
- 27329 and **'L'**, respectively. The implementation shall also support the values 1, 2, and 4, even if it
- 27330 provides no C-Language types of those sizes. The byte order used when interpreting numeric
- 27331 values is implementation-dependent, but shall correspond to the order in which a constant of

the corresponding type is stored in memory on the system.

- For the type specifier character **f**, the default number of bytes shall correspond to the number of bytes in the underlying implementation's basic double precision floating-point data type. The implementation shall support values of the optional number of bytes to be converted corresponding to the number of bytes in the C-language types **float**, **double**, and **long double**. These numbers can also be specified by an application as the characters '**F**', '**D**', and '**L**', respectively.

The type specifier character **a** specifies that bytes are interpreted as named characters from the International Reference Version (IRV) of the ISO/IEC 646:1991 standard. Only the least significant seven bits of each byte shall be used for this type specification. Bytes with the values listed in the following table shall be written using the corresponding names for those characters.

**Table 4-12** Named Characters in *od*

| Value | Name       | Value | Name       | Value | Name             | Value | Name       |
|-------|------------|-------|------------|-------|------------------|-------|------------|
| \000  | <b>nul</b> | \001  | <b>soh</b> | \002  | <b>stx</b>       | \003  | <b>etx</b> |
| \004  | <b>eot</b> | \005  | <b>enq</b> | \006  | <b>ack</b>       | \007  | <b>bel</b> |
| \010  | <b>bs</b>  | \011  | <b>ht</b>  | \012  | <b>lf or nl*</b> | \013  | <b>vt</b>  |
| \014  | <b>ff</b>  | \015  | <b>cr</b>  | \016  | <b>so</b>        | \017  | <b>si</b>  |
| \020  | <b>dle</b> | \021  | <b>dc1</b> | \022  | <b>dc2</b>       | \023  | <b>dc3</b> |
| \024  | <b>dc4</b> | \025  | <b>nak</b> | \026  | <b>syn</b>       | \027  | <b>etb</b> |
| \030  | <b>can</b> | \031  | <b>em</b>  | \032  | <b>sub</b>       | \033  | <b>esc</b> |
| \034  | <b>fs</b>  | \035  | <b>gs</b>  | \036  | <b>rs</b>        | \037  | <b>us</b>  |
| \040  | <b>sp</b>  | \177  | <b>del</b> |       |                  |       |            |

**Note:** The "\012" value may be written either as **lf** or **nl**.

The type specifier character **c** specifies that bytes are interpreted as characters specified by the current setting of the *LC\_CTYPE* locale category. Characters listed in the table in the System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 5, File Format Notation ("\\", '\a', '\b', '\f', '\n', '\r', '\t', '\v') shall be written as the corresponding escape sequences, except that backslash shall be written as a single backslash and a NUL shall be written as '\0'. Other non-printable characters shall be written as one three-digit octal number for each byte in the character. If the size of a byte on the system is greater than nine bits, the format used for non-printable characters is implementation-dependent. Printable multi-byte characters shall be written in the area corresponding to the first byte of the character; the two-character sequence "\*\*\*" shall be written in the area corresponding to each remaining byte in the character, as an indication that the character is continued. When either the **-j skip** or **-N count** option is specified along with the **c** type specifier, and this results in an attempt to start or finish in the middle of a multi-byte character, the result is implementation-dependent.

The input data shall be manipulated in blocks, where a block is defined as a multiple of the least common multiple of the number of bytes transformed by the specified output types. If the least common multiple is greater than 16, the results are unspecified. Each input block shall be written as transformed by each output type, one per written line, in the order that the output types were specified. If the input block size is larger than the number of bytes transformed by the output type, the output type shall sequentially transform the parts of the input block, and the output from each of the transformations shall be separated by one or more <blank> characters.

If, as a result of the specification of the **-N** option or end-of-file being reached on the last input file, input data only partially satisfies an output type, the input shall be extended sufficiently

27379 with null bytes to write the last byte of the input.

27380 Unless **-A n** is specified, the first output line produced for each input block shall be preceded by  
 27381 the input offset, cumulative across input files, of the next byte to be written. The format of the  
 27382 input offset is unspecified; however, it shall not contain any <blank> characters, shall start at the  
 27383 first character of the output line, and shall be followed by one or more <blank> characters. In  
 27384 addition, the offset of the byte following the last byte written shall be written after all the input  
 27385 data has been processed, but shall not be followed by any <blank> characters.

27386 If no **-A** option is specified, the input offset base is unspecified.

27387 **EXIT STATUS**

27388 The following exit values shall be returned:

27389 0 All input files were processed successfully.

27390 >0 An error occurred.

27391 **CONSEQUENCES OF ERRORS**

27392 Default.

27393 **APPLICATION USAGE**

27394 Applications are warned not to use file names starting with '+' or a first operand starting with  
 27395 a numeric character so that the old functionality can be maintained by implementations, unless  
 27396 they specify one of the new options specified by the ISO/IEC 9945-2:1993 standard. To  
 27397 guarantee that one of these file names is always interpreted as a file name, an application could  
 27398 always specify the address base format with the **-A** option.

27399 **EXAMPLES**

27400 If a file containing 128 bytes with decimal values zero to 127, in increasing order, is supplied as  
 27401 standard input to the command:

27402 `od -A d -t a`

27403 on an implementation using an input block size of 16 bytes, the standard output, independent of  
 27404 the current locale setting, would be similar to:

|       |          |     |     |     |     |     |     |     |     |     |    |     |     |    |    |    |     |
|-------|----------|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|-----|-----|----|----|----|-----|
| 27405 | 00000000 | nul | soh | stx | etx | eot | enq | ack | bel | bs  | ht | nl  | vt  | ff | cr | so | si  |
| 27406 | 0000016  | dle | dc1 | dc2 | dc3 | dc4 | nak | syn | etb | can | em | sub | esc | fs | gs | rs | us  |
| 27407 | 0000032  | sp  | !   | "   | #   | \$  | %   | &   | '   | (   | )  | *   | +   | ,  | -  | .  | /   |
| 27408 | 0000048  | 0   | 1   | 2   | 3   | 4   | 5   | 6   | 7   | 8   | 9  | :   | ;   | <  | =  | >  | ?   |
| 27409 | 0000064  | @   | A   | B   | C   | D   | E   | F   | G   | H   | I  | J   | K   | L  | M  | N  | O   |
| 27410 | 0000080  | P   | Q   | R   | S   | T   | U   | V   | W   | X   | Y  | Z   | [   | \  | ]  | ^  | _   |
| 27411 | 0000096  | `   | a   | b   | c   | d   | e   | f   | g   | h   | i  | j   | k   | l  | m  | n  | o   |
| 27412 | 0000112  | p   | q   | r   | s   | t   | u   | v   | w   | x   | y  | z   | {   |    | }  | ~  | del |
| 27413 | 0000128  |     |     |     |     |     |     |     |     |     |    |     |     |    |    |    |     |

27414 Note that this volume of IEEE Std. 1003.1-200x allows **nl** or **lf** to be used as the name for the  
 27415 ISO/IEC 646:1991 standard IRV character with decimal value 10. The IRV names this character  
 27416 **lf** (line feed), but traditional implementations have referred to this character as newline (**nl**) and  
 27417 the POSIX locale character set symbolic name for the corresponding character is a <newline>  
 27418 character.

27419 The command:

27420 `od -A o -t o2x2x -n 18`

27421 on a system with 32-bit words and an implementation using an input block size of 16 bytes  
 27422 could write 18 bytes in approximately the following format:

```

27423 00000000 032056 031440 041123 042040 052516 044530 020043 031464
27424 342e 3320 4253 4420 554e 4958 2023 3334
27425 342e3320 42534420 554e4958 20233334
27426 00000020 032472
27427 353a
27428 353a0000
27429 00000022

```

27430 The command:

```
27431 od -A d -t f -t o4 -t x4 -n 24 -j 0x15
```

27432 on a system with 64-bit doubles (for example, the IEEE Std. 754:1985 standard double precision  
 27433 floating-point format) would skip 21 bytes of input data and then write 24 bytes in  
 27434 approximately the following format:

```

27435 00000000 1.0000000000000000e+00 1.5735000000000000e+01
27436 07774000000 000000000000 10013674121 35341217270
27437 3ff00000 00000000 402f3851 eb851eb8
27438 00000016 1.4066823000000000e+02
27439 10030312542 04370303230
27440 40619562 23e18698
27441 00000024

```

#### 27442 RATIONALE

27443 The *od* utility went through several names in early proposals, including *hd*, *xd*, and most recently  
 27444 *hexdump*. There were several objections to all of these based on the following reasons:

- 27445 • The *hd* and *xd* names conflicted with historical utilities that behaved differently.
- 27446 • The *hexdump* description was much more complex than needed for a simple dump utility.
- 27447 • The *od* utility has been available on all historical implementations and there was no need to  
 27448 create a new name for a utility so similar to the historical *od* utility.

27449 The original reasons for not standardizing historical *od* were also fairly widespread. Those  
 27450 reasons are given below along with rationale explaining why the standard developers believe  
 27451 that this version does not suffer from the indicated problem:

- 27452 • The BSD and System V versions of *od* have diverged, and the intersection of features  
 27453 provided by both does not meet the needs of the user community. In fact, the System V  
 27454 version only provides a mechanism for dumping octal bytes and **shorts**, signed and unsigned  
 27455 decimal **shorts**, hexadecimal **shorts**, and ASCII characters. BSD added the ability to dump  
 27456 **floats**, **doubles**, named ASCII characters, and octal, signed decimal, unsigned decimal, and  
 27457 hexadecimal **longs**. The version presented here provides more normalized forms for  
 27458 dumping bytes, **shorts**, **ints**, and **longs** in octal, signed decimal, unsigned decimal, and  
 27459 hexadecimal; **float**, **double**, and **long double**; and named ASCII as well as current locale  
 27460 characters.
- 27461 • It would not be possible to come up with a compatible superset of the BSD and System V  
 27462 flags that met the requirements of the standard developers. The historical default *od* output is  
 27463 the specified default output of this utility. None of the option letters chosen for this version  
 27464 of *od* conflict with any of the options to historical versions of *od*.
- 27465 • On systems with different sizes for **short**, **int**, and **long**, there was no way to ask for dumps  
 27466 of **ints**, even in the BSD version. Because of the way options are named, the namespace could  
 27467 not be extended to solve these problems. This is why the **-t** option was added (with type  
 27468 specifiers more closely matched to the *printf()* formats used in the rest of this volume of

IEEE Std. 1003.1-200x) and the optional field sizes were added to the **d**, **f**, **o**, **u**, and **x** type specifiers. It is also one of the reasons why the historical practice was not mandated as a required obsolescent form of *od*. (Although the old versions of *od* are not listed as an obsolescent form, implementations are urged to continue to recognize the older forms for several more years.) The **a**, **c**, **f**, **o**, and **x** types match the meaning of the corresponding format characters in the historical implementations of *od* except for the default sizes of the fields converted. The **d** format is signed in this volume of IEEE Std. 1003.1-200x to match the *printf()* notation. (Historical versions of *od* used **d** as a synonym for **u** in this version. The System V implementation uses **s** for signed decimal; BSD uses **i** for signed decimal and **s** for null-terminated strings.) Other than **d** and **u**, all of the type specifiers match format characters in the historical BSD version of *od*.

The sizes of the C-language types **char**, **short**, **int**, **long**, **float**, **double**, and **long double** are used even though it is recognized that there may be zero or more than one compiler for the C language on an implementation and that they may use different sizes for some of these types. (For example, one compiler might use 2 bytes **shorts**, 2 bytes **ints**, and 4 bytes **longs**, while another compiler (or an option to the same compiler) uses 2 bytes **shorts**, 4 bytes **ints**, and 4 bytes **longs**.) Nonetheless, there has to be a basic size known by the implementation for these types, corresponding to the values reported by invocations of the *getconf* utility when called with *system\_var* operands {UCHAR\_MAX}, {USHORT\_MAX}, {UINT\_MAX}, and {ULONG\_MAX} for the types **char**, **short**, **int**, and **long**, respectively. There are similar constants required by the ISO C standard, but not required by the System Interfaces volume of IEEE Std. 1003.1-200x or this volume of IEEE Std. 1003.1-200x. They are {FLT\_MANT\_DIG}, {DBL\_MANT\_DIG}, and {LDBL\_MANT\_DIG} for the types **float**, **double**, and **long double**, respectively. If the optional *c89* utility is provided by the implementation and used as specified by this volume of IEEE Std. 1003.1-200x, these are the sizes that would be provided. If an option is used that specifies different sizes for these types, there is no guarantee that the *od* utility is able to interpret binary data output by such a program correctly.

This volume of IEEE Std. 1003.1-200x requires that the numeric values of these lengths be recognized by the *od* utility and that symbolic forms also be recognized. Thus, a portable application can always look at an array of **unsigned long** data elements using *od -t uL*.

- The method of specifying the format for the address field based on specifying a starting offset in a file unnecessarily tied the two together. The **-A** option now specifies the address base and the **-S** option specifies a starting offset.
- It would be difficult to break the dependence on U.S. ASCII to achieve an internationalized utility. It does not seem to be any harder for *od* to dump characters in the current locale than it is for the *ed* or *sed* **l** commands. The **c** type specifier does this without difficulty and is completely compatible with the historical implementations of the **c** format character when the current locale uses a superset of the ISO/IEC 646:1991 standard as a codeset. The **a** type specifier (from the BSD **a** format character) was left as a portable means to dump ASCII (or more correctly ISO/IEC 646:1991 standard (IRV)) so that headers produced by *pax* could be deciphered even on systems that do not use the ISO/IEC 646:1991 standard as a subset of their base codeset.

The use of **"\*\*"** as an indication of continuation of a multi-byte character in **c** specifier output was chosen based on seeing an implementation that uses this method. The continuation bytes have to be marked in a way that is not ambiguous with another single-byte or multi-byte character.

An early proposal used **-S** and **-n**, respectively, for the **-j** and **-N** options eventually selected. These were changed to avoid conflicts with historical implementations.

27518 The original standard specified **-t o2** as the default when no output type was given. This was  
27519 changed to **-t oS** (the length of a **short**) to accommodate a supercomputer implementation that  
27520 historically used 64 bits as its default (and that defined shorts as 64 bits). This change should not  
27521 affect portable applications. The requirement to support lengths of 1, 2, and 4 was added at the  
27522 same time to address an historical implementation that had no two-byte data types in its C  
27523 compiler.

27524 **FUTURE DIRECTIONS**

27525 All option and operand interfaces marked as extensions may be withdrawn in a future issue.

27526 **SEE ALSO**

27527 *sed*

27528 **CHANGE HISTORY**

27529 First released in Issue 2.

27530 **Issue 4**

27531 Aligned with the ISO/IEC 9945-2:1993 standard.

27532 **Issue 4, Version 2**

27533 The description of the **-c** option is made dependent on the current setting of the *LC\_CTYPE*  
27534 category, and a reference to the POSIX locale is deleted.

27535 **Issue 5**

27536 In the description of the **-c** option, the phrase “This is equivalent to **-t c**.” is deleted.

27537 The FUTURE DIRECTIONS section has been modified.

27538 **Issue 6**

27539 The *od* utility is changed to remove the assumption that **short** was a two-byte entity, as per the  
27540 revisions in the IEEE P1003.2b draft standard.

27541 The normative text is reworded to avoid use of the term “must” for application requirements.

27542 **NAME**

27543       paste — merge corresponding or subsequent lines of files

27544 **SYNOPSIS**

27545       paste [-s][-d *list*] *file...*

27546 **DESCRIPTION**

27547       The *paste* utility shall concatenate the corresponding lines of the given input files, and writes the  
27548       resulting lines to standard output.

27549       The default operation of *paste* shall concatenate the corresponding lines of the input files. The  
27550       <newline> character of every line except the line from the last input file shall be replaced with a  
27551       <tab> character.

27552       If an end-of-file condition is detected on one or more input files, but not all input files, *paste* shall  
27553       behave as though empty lines were read from the files on which end-of-file was detected, unless  
27554       the *-s* option is specified.

27555 **OPTIONS**

27556       The *paste* utility shall conform to the System Interface Definitions volume of  
27557       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

27558       The following options shall be supported:

27559       *-d list*       Unless a backslash character appears in *list*, each character in *list* is an element  
27560       specifying a delimiter character. If a backslash character appears in *list*, the  
27561       backslash character and one or more characters following it are an element  
27562       specifying a delimiter character as described below. These elements specify one or  
27563       more delimiters to use, instead of the default <tab> character, to replace the  
27564       <newline> character of the input lines. The elements in *list* shall be used circularly;  
27565       that is, when the list is exhausted the first element from the list is reused. When the  
27566       *-s* option is specified:

- 27567       • The last <newline> character in a file shall not be modified.
- 27568       • The delimiter shall be reset to the first element of list after each *file* operand is  
27569       processed.

27570       When the *-s* option is not specified:

- 27571       • The <newline> characters in the file specified by the last *file* operand shall not  
27572       be modified.
- 27573       • The delimiter shall be reset to the first element of list each time a line is  
27574       processed from each file.

27575       If a backslash character appears in *list*, it and the character following it shall be  
27576       used to represent the following delimiter characters:

27577       \n   <newline> character.

27578       \t   <tab> character.

27579       \\   Backslash character.

27580       \0   Empty string (not a null character). If '\0' is immediately followed by the  
27581       character 'x', the character 'X', or any character defined by the *LC\_CTYPE*  
27582       *digit* keyword (see the System Interface Definitions volume of  
27583       IEEE Std. 1003.1-200x, Chapter 7, Locale), the results are unspecified.

- 27584 If any other characters follow the backslash, the results are unspecified.
- 27585 **-s** Concatenate all of the lines of each separate input file in command line order. The  
27586 <newline> character of every line except the last line in each input file shall be  
27587 replaced with the <tab> character, unless otherwise specified by the **-d** option.
- 27588 **OPERANDS**
- 27589 The following operand shall be supported:
- 27590 **file** A path name of an input file. If **'-'** is specified for one or more of the *files*, the  
27591 standard input shall be used; the standard input shall be read one line at a time,  
27592 circularly, for each instance of **'-'**. Implementations shall support pasting of at  
27593 least 12 *file* operands.
- 27594 **STDIN**
- 27595 The standard input shall be used only if one or more *file* operands is **'-'**. See the INPUT FILES  
27596 section.
- 27597 **INPUT FILES**
- 27598 The input files shall be text files, except that line lengths shall be unlimited.
- 27599 **ENVIRONMENT VARIABLES**
- 27600 The following environment variables shall affect the execution of *paste*:
- 27601 **LANG** Provide a default value for the internationalization variables that are unset or null.  
27602 If *LANG* is unset or null, the corresponding value from the implementation-  
27603 dependent default locale shall be used. If any of the internationalization variables  
27604 contains an invalid setting, the utility shall behave as if none of the variables had  
27605 been defined.
- 27606 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
27607 internationalization variables.
- 27608 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
27609 characters (for example, single-byte as opposed to multi-byte characters in  
27610 arguments and input files).
- 27611 **LC\_MESSAGES**
- 27612 Determine the locale that should be used to affect the format and contents of  
27613 diagnostic messages written to standard error.
- 27614 **XSI NLS\_PATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 27615 **ASYNCHRONOUS EVENTS**
- 27616 Default.
- 27617 **STDOUT**
- 27618 Concatenated lines of input files shall be separated by the <tab> character (or other characters  
27619 under the control of the **-d** option) and terminated by a <newline> character.
- 27620 **STDERR**
- 27621 Used only for diagnostic messages.
- 27622 **OUTPUT FILES**
- 27623 None.
- 27624 **EXTENDED DESCRIPTION**
- 27625 None.

27626 **EXIT STATUS**

27627       The following exit values shall be returned:

27628       0   Successful completion.

27629       >0   An error occurred.

27630 **CONSEQUENCES OF ERRORS**

27631       If one or more input files cannot be opened when the **-s** option is not specified, a diagnostic message shall be written to standard error, but no output is written to standard output. If the **-s** option is specified, the *paste* utility shall provide the default behavior described in Section 1.11 on page 25.

27635 **APPLICATION USAGE**

27636       When the escape sequences of the *list* option-argument are used in a shell script, they must be quoted; otherwise, the shell treats the `'\'` as a special character.

27638       Portable applications should only use the specific backslash escaped delimiters presented in this volume of IEEE Std. 1003.1-200x. Historical implementations treat `'\x'`, where `'x'` is not in this list, as `'x'`, but future implementations are free to expand this list to recognize other common escapes similar to those accepted by *printf* and other standard utilities.

27642       Most of the standard utilities work on text files. The *cut* utility can be used to turn files with arbitrary line lengths into a set of text files containing the same data. The *paste* utility can be used to create (or recreate) files with arbitrary line lengths. For example, if **file** contains long lines:

27645       cut -b 1-500 -n file > file1

27646       cut -b 501- -n file > file2

27647       creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline> character) and **file2** that contains the remainder of the data from **file**. Note that **file2** is not a text file if there are lines in **file** that are longer than 500 + {LINE\_MAX} bytes. The original file can be recreated from **file1** and **file2** using the command:

27651       paste -d "\0" file1 file2 > file

27652       The commands:

27653       paste -d "\0" ...

27654       paste -d " " ...

27655       are not necessarily equivalent; the latter is not specified by this volume of IEEE Std. 1003.1-200x and may result in an error. The construct `'\0'` is used to mean “no separator” because historical versions of *paste* did not follow the syntax guidelines, and the command:

27658       paste -d " " ...

27659       could not be handled properly by *getopt()*.

27660 **EXAMPLES**

27661       1. Write out a directory in four columns:

27662       ls | paste - - - -

27663       2. Combine pairs of lines from a file into single lines:

27664       paste -s -d "\t\n" file

27665 **RATIONALE**

27666 None.

27667 **FUTURE DIRECTIONS**

27668 None.

27669 **SEE ALSO**27670 *cut, grep, pr*27671 **CHANGE HISTORY**

27672 First released in Issue 2.

27673 **Issue 4**

27674 Aligned with the ISO/IEC 9945-2:1993 standard.

27675 **Issue 6**

27676 The normative text is reworded to avoid use of the term “must” for application requirements.

## 27677 NAME

27678 patch — apply changes to files

## 27679 SYNOPSIS

```
27680 UP patch [-blNR][-c | -e | -n][-d dir][-D define][-i patchfile]
27681 [-o outfile][-p num][-r rejectfile][file]
27682
```

## 27683 DESCRIPTION

27684 The *patch* utility shall read a source (patch) file containing any of the three forms of difference  
 27685 (diff) listings produced by the *diff* utility (normal, context or in the style of *ed*) and apply those  
 27686 differences to a file. By default, *patch* shall read from the standard input.

27687 The *patch* utility shall attempt to determine the type of the *diff* listing, unless overruled by a *-c*,  
 27688 *-e*, or *-n* option.

27689 If the patch file contains more than one patch, *patch* shall attempt to apply each of them as if they  
 27690 came from separate patch files. (In this case, the application shall ensure that the name of the  
 27691 patch file is determinable for each *diff* listing.)

## 27692 OPTIONS

27693 The *patch* utility shall conform to the System Interface Definitions volume of  
 27694 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

27695 The following options shall be supported:

27696 **-b** Save a copy of the original contents of each modified file, before the differences are  
 27697 applied, in a file of the same name with the suffix **.orig** appended to it. If the file  
 27698 already exists, it shall be overwritten; if multiple patches are applied to the same  
 27699 file, the **.orig** file shall be written only for the first patch. When the *-o outfile* option  
 27700 is also specified, *file.orig* shall not be created but, if *outfile* already exists,  
 27701 *outfile.orig* shall be created.

27702 **-c** Interpret the patch file as a context difference (the output of the utility *diff* when  
 27703 the *-c* or *-C* options are specified).

27704 **-d dir** Change the current directory to *dir* before processing as described in the  
 27705 EXTENDED DESCRIPTION section.

27706 **-D define** Mark changes with one of the following C preprocessor constructs:

```
27707 #ifdef define
27708 ...
27709 #endif
27710 #ifndef define
27711 ...
27712 #endif
```

27713 optionally combined with the C preprocessor construct **#else**.

27714 **-e** Interpret the patch file as an *ed* script, rather than a *diff* script.

27715 **-i patchfile** Read the patch information from the file named by the path name *patchfile*, rather  
 27716 than the standard input.

27717 **-l** (The letter ell.) Cause any sequence of <blank> characters in the difference script to  
 27718 match any sequence of <blank> characters in the input file. Other characters shall  
 27719 be matched exactly.

|       |                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 27735 | <b>-R</b>                                                                        | Reverse the sense of the patch script; that is, assume that the difference script was created from the new version to the old version. The <b>-R</b> option cannot be used with <i>ed</i> scripts. The <i>patch</i> utility attempts to reverse each portion of the script before applying it. Rejected differences shall be saved in swapped format. If this option is not specified, and until a portion of the patch file is successfully applied, <i>patch</i> attempts to apply each portion in its reversed sense as well as in its normal sense. If the attempt is successful, the user shall be prompted to determine if the <b>-R</b> option should be set. |

| 27757 |                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 27758 |                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 27759 |                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 27760 | <i>LC_ALL</i>                                                                    | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 27761 |                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 27762 | <i>LC_CTYPE</i>                                                                  | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 27763 |                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 27764 |                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

27765 **LC\_MESSAGES**  
 27766 Determine the locale that should be used to affect the format and contents of  
 27767 diagnostic messages written to standard error and informative messages written to  
 27768 standard output.

27769 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

27770 **LC\_TIME** Determine the locale for recognizing the format of file timestamps written by the  
 27771 *diff* utility in a context-difference input file.

27772 **ASYNCHRONOUS EVENTS**  
 27773 Default.

27774 **STDOUT**  
 27775 Not used.

27776 **STDERR**  
 27777 Used for diagnostic and informational messages.

27778 **OUTPUT FILES**  
 27779 The output of the *patch* utility, the save files (**.orig** suffixes) and the reject files (**.rej** suffixes) shall  
 27780 be text files.

27781 **EXTENDED DESCRIPTION**  
 27782 A patchfile may contain patching instructions for more than one file; file names shall be  
 27783 determined as specified in **File Name Determination** on page 729. When the **-b** option is  
 27784 specified, for each patched file, the original shall be saved in a file of the same name with the  
 27785 suffix **.orig** appended to it.

27786 For each patched file, a reject file may also be created as noted in **Patch Application** on page 729.  
 27787 In the absence of a **-r** option, the name of this file shall be formed by appending the suffix **.rej** to  
 27788 the original file name.

27789 **Patchfile Format**  
 27790 The patch file shall contain zero or more lines of header information followed by one or more  
 27791 patches. Each patch shall contain zero or more lines of file name identification in the format  
 27792 produced by *diff -c*, and one or more sets of *diff* output, which are customarily called *hunks*.

27793 The *patch* utility shall recognize the following expression in the header information:

27794 **Index: *pathname***  
 27795 The file to be patched is named *pathname*.

27796 If all lines (including headers) within a patch begin with the same leading sequence of <blank>  
 27797 characters, the *patch* utility shall remove this sequence before proceeding. Within each patch, if  
 27798 the type of difference is context, the *patch* utility shall recognize the following expressions:

27799 **\*\*\* *filename* timestamp**  
 27800 The patches arose from *filename*.

27801 **--- *filename* timestamp**  
 27802 The patches should be applied to *filename*.

27803 Each hunk within a patch shall be the *diff* output to change a line range within the original file.  
 27804 The line numbers for successive hunks within a patch shall occur in ascending order.

27805 **File Name Determination**

27806 If no *file* operand is specified, *patch* shall perform the following steps to determine the file name  
 27807 to use:

- 27808 1. If the type of *diff* is context, the *patch* utility shall delete path name components (as  
 27809 specified by the **-p** option) from the file name on the line beginning with "\*\*\*\*", then test  
 27810 for the existence of this file relative to the current directory (or the directory specified with  
 27811 the **-d** option). If the file exists, the *patch* utility shall use this file name.
- 27812 2. If the type of *diff* is context, the *patch* utility shall delete the path name components (as  
 27813 specified by the **-p** option) from the file name on the line beginning with "——", then test  
 27814 for the existence of this file relative to the current directory (or the directory specified with  
 27815 the **-d** option). If the file exists, the *patch* utility shall use this file name.
- 27816 3. If the header information contains a line beginning with the string **Index:**, the *patch* utility  
 27817 shall delete path name components (as specified by the **-p** option) from this line, then test  
 27818 for the existence of this file relative to the current directory (or the directory specified with  
 27819 the **-d** option). If the file exists, the *patch* utility shall use this file name.
- 27820 XSI 4. If an **SCCS** directory exists in the current directory, *patch* shall attempt to perform a **get -e**  
 27821 **SCCS/s.filename** command to retrieve an editable version of the file.
- 27822 5. The *patch* utility shall write a prompt to standard output and request a file name  
 27823 interactively from the controlling terminal (for example, **/dev/tty**).

27824 **Patch Application**

27825 If the **-c**, **-e**, or **-n** option is present, the *patch* utility shall interpret information within each hunk  
 27826 as a context difference, an *ed* difference or a normal difference, respectively. In the absence of  
 27827 any of these options, the *patch* utility shall determine the type of difference based on the format  
 27828 of information within the hunk.

27829 For each hunk, the *patch* utility shall begin to search for the place to apply the patch at the line  
 27830 number at the beginning of the hunk, plus or minus any offset used in applying the previous  
 27831 hunk. If lines matching the hunk context are not found, *patch* shall scan both forwards and  
 27832 backwards at least 1 000 bytes for a set of lines that match the hunk context.

27833 If no such place is found and it is a context difference, then another scan shall take place,  
 27834 ignoring the first and last line of context. If that fails, the first two and last two lines of context  
 27835 shall be ignored and another scan shall be made. Implementations may search more extensively  
 27836 for installation locations.

27837 If no location can be found, the *patch* utility shall append the hunk to the reject file. The rejected  
 27838 hunk shall be written in context-difference format regardless of the format of the patch file. If the  
 27839 input was a normal or *ed*-style difference, the reject file may contain differences with zero lines  
 27840 of context. The line numbers on the hunks in the reject file may be different from the line  
 27841 numbers in the patch file since they shall reflect the approximate locations for the failed hunks in  
 27842 the new file rather than the old one.

27843 If the type of patch is an *ed* diff, the implementation may accomplish the patching by invoking  
 27844 the *ed* utility.

27845 **EXIT STATUS**

27846 The following exit values shall be returned:

- 27847 0 Successful completion.

27848           1   One or more lines were written to a reject file.

27849           >1   An error occurred.

## 27850 CONSEQUENCES OF ERRORS

27851           Patches that cannot be correctly placed in the file shall be written to a reject file.

## 27852 APPLICATION USAGE

27853           The **-R** option does not work with *ed* scripts because there is too little information to reconstruct the reverse operation.

27855           The **-p** option makes it possible to customize a patchfile to local user directory structures without manually editing the patchfile. For example, if the file name in the patch file was:

27857           /curds/whey/src/blurfl/blurfl.c

27858           Setting **-p 0** gives the entire path name unmodified; **-p 1** gives:

27859           curds/whey/src/blurfl/blurfl.c

27860           without the leading slash, **-p 4** gives:

27861           blurfl/blurfl.c

27862           and not specifying **-p** at all gives:

27863           blurfl.c .

27864           When using **-b** in some file system implementations, the saving of a **.orig** file may produce unwanted results. In the case of 12, 13, or 14-character file names, on file systems supporting 14-character maximum file names, the **.orig** file overwrites the new file.

27867           Application writers should note that this utility need not be provided on systems that do not support the User Portability Utilities option.

## 27869 EXAMPLES

27870           None.

## 27871 RATIONALE

27872           Some of the functionality in historical *patch* implementations was not specified. The following documents those features present in historical implementations that have not been specified.

27874           A deleted piece of functionality was the '+' pseudo-option allowing an additional set of options and a patch file operand to be given. This was seen as being insufficiently useful to standardize.

27876           In historical implementations, if the string "Prereq: " appeared in the header, the *patch* utility would search for the corresponding version information (the string specified in the header, delimited by <blank>s or the beginning or end of a line or the file) anywhere in the original file. This was deleted as too simplistic and insufficiently trustworthy a mechanism to standardize. For example, if:

27881           Prereq: 1.2

27882           were in the header, the presence of a delimited 1.2 anywhere in the file would satisfy the prerequisite.

27884           The following options were dropped from historical implementations of *patch* as insufficiently useful to standardize:

27886           **-b**       The **-b** option historically provided a method for changing the name extension of the backup file from the default **.orig**. This option has been modified and retained in this volume of IEEE Std. 1003.1-200x.

| 27889 | <b>-F</b>                | The <b>-F</b> option specified the number of lines of a context diff to ignore when searching for a place to install a patch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 27890 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27891 | <b>-f</b>                | The <b>-f</b> option historically caused <i>patch</i> not to request additional information from the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 27892 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27893 | <b>-r</b>                | The <b>-r</b> option historically provided a method of overriding the extension of the reject file from the default <b>.rej</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 27894 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27895 | <b>-s</b>                | The <b>-s</b> option historically caused <i>patch</i> to work silently unless an error occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 27896 | <b>-x</b>                | The <b>-x</b> option historically set internal debugging flags.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27897 |                          | In some file system implementations, the saving of a <b>.orig</b> file may produce unwanted results. In the case of 12, 13, or 14-character file names (on file systems supporting 14-character maximum file names), the <b>.orig</b> file overwrites the new file. The reject file may also exceed this file name limit. It was suggested, due to some historical practice, that a tilde ('~') suffix be used instead of <b>.orig</b> and some other character instead of the <b>.rej</b> suffix. This was rejected because it is not obvious to the user which file is which. The suffixes <b>.orig</b> and <b>.rej</b> are clearer and more understandable. |
| 27898 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27899 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27900 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27901 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27902 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27903 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27904 |                          | The <b>-b</b> option has the opposite sense in some historical implementations—do not save the <b>.orig</b> file. The default case here is not to save the files, making <i>patch</i> behave more consistently with the other standard utilities.                                                                                                                                                                                                                                                                                                                                                                                                              |
| 27905 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27906 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27907 |                          | The <b>-w</b> option in early proposals was changed to <b>-l</b> to match historical practice.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 27908 |                          | The <b>-N</b> option was included because without it, a non-interactive application cannot reject previously applied patches. For example, if a user is piping the output of <i>diff</i> into the <i>patch</i> utility, and the user only wants to patch a file to a newer version non-interactively, the <b>-N</b> option is required.                                                                                                                                                                                                                                                                                                                        |

| 27912 |                          | Changes to the <b>-l</b> option description were proposed to allow matching across <newline>s in addition to just <blank>s. Since this is not historical practice, and since some ambiguities could result, it is suggested that future developments in this area utilize another option letter, such as <b>-L</b> .                                                                                                                                                                                                                                                                                                                                           |

| 27926 |                          | The description of the <b>-D</b> option and the steps in <b>File Name Determination</b> on page 729 are changed to match historical practice as defined in the IEEE P1003.2b draft standard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 27927 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 27928 |                          | The normative text is reworded to avoid use of the term “must” for application requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

27929 **NAME**

27930 pathchk — check path names

27931 **SYNOPSIS**27932 pathchk [-p] *pathname...*27933 **DESCRIPTION**

27934 The *pathchk* utility shall check that one or more path names are valid (that is, they could be used  
 27935 to access or create a file without causing syntax errors) and portable (that is, no file name  
 27936 truncation results). More extensive portability checks are provided by the **-p** option.

27937 By default, the *pathchk* utility shall check each component of each *pathname* operand based on the  
 27938 underlying file system. A diagnostic shall be written for each *pathname* operand that:

- 27939 • Is longer than {PATH\_MAX} bytes (see **Path Name Variable Values** in the System Interface  
 27940 Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, Headers, <limits.h>)
- 27941 • Contains any component longer than {NAME\_MAX} bytes in its containing directory
- 27942 • Contains any component in a directory that is not searchable
- 27943 • Contains any character in any component that is not valid in its containing directory

27944 The format of the diagnostic message is not specified, but shall indicate the error detected and  
 27945 the corresponding *pathname* operand.

27946 It shall not be considered an error if one or more components of a *pathname* operand do not exist  
 27947 as long as a file matching the path name specified by the missing components could be created  
 27948 that does not violate any of the checks specified above.

27949 **OPTIONS**

27950 The *pathchk* utility shall conform to the System Interface Definitions volume of  
 27951 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

27952 The following option shall be supported:

- 27953 **-p** Instead of performing checks based on the underlying file system, write a  
 27954 diagnostic for each *pathname* operand that:
  - 27955 • Is longer than {\_POSIX\_PATH\_MAX} bytes (see **Minimum Values** in the  
 27956 System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 13,  
 27957 Headers, <limits.h>)
  - 27958 • Contains any component longer than {\_POSIX\_NAME\_MAX} bytes
  - 27959 • Contains any character in any component that is not in the portable file name  
 27960 character set

27961 **OPERANDS**

27962 The following operand shall be supported:

27963 *pathname* A path name to be checked.

27964 **STDIN**

27965 Not used.

27966 **INPUT FILES**

27967 None.

27968 **ENVIRONMENT VARIABLES**

27969 The following environment variables shall affect the execution of *pathchk*:

27970 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 27971 If *LANG* is unset or null, the corresponding value from the implementation-  
 27972 dependent default locale shall be used. If any of the internationalization variables  
 27973 contains an invalid setting, the utility shall behave as if none of the variables had  
 27974 been defined.

27975 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 27976 internationalization variables.

27977 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 27978 characters (for example, single-byte as opposed to multi-byte characters in  
 27979 arguments).

27980 **LC\_MESSAGES**  
 27981 Determine the locale that should be used to affect the format and contents of  
 27982 diagnostic messages written to standard error.

27983 **NSI** **NLS\_PATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

27984 **ASYNCHRONOUS EVENTS**

27985 Default.

27986 **STDOUT**

27987 Not used.

27988 **STDERR**

27989 Used only for diagnostic messages.

27990 **OUTPUT FILES**

27991 None.

27992 **EXTENDED DESCRIPTION**

27993 None.

27994 **EXIT STATUS**

27995 The following exit values shall be returned:

27996 0 All *pathname* operands passed all of the checks.

27997 >0 An error occurred.

27998 **CONSEQUENCES OF ERRORS**

27999 Default.

28000 **APPLICATION USAGE**

28001 The *test* utility can be used to determine whether a given path name names an existing file; it  
 28002 does not, however, give any indication of whether or not any component of the path name was  
 28003 truncated in a directory where the *\_POSIX\_NO\_TRUNC* feature is not in effect. The *pathchk*  
 28004 utility does not check for file existence; it performs checks to determine if a path name does exist  
 28005 or could be created with no path name component truncation.

28006 The *noclobber* option in the shell (see the *set* on page 117 special built-in) can be used to  
 28007 atomically create a file. As with all file creation semantics in the System Interfaces volume of  
 28008 IEEE Std. 1003.1-200x, it guarantees atomic creation, but still depends on applications to agree  
 28009 on conventions and cooperate on the use of files after they have been created.

28010 **EXAMPLES**

28011 To verify that all path names in an imported data interchange archive are legitimate and  
 28012 unambiguous on the current system:

```
28013 pax -f archive | sed -e '/' == './s///' | xargs pathchk
28014 if [$? -eq 0]
28015 then
28016 pax -r -f archive
28017 else
28018 echo Investigate problems before importing files.
28019 exit 1
28020 fi
```

28021 To verify that all files in the current directory hierarchy could be moved to any system  
 28022 conforming to the System Interfaces volume of IEEE Std. 1003.1-200x that also supports the *pax*  
 28023 utility:

```
28024 find . -print | xargs pathchk -p
28025 if [$? -eq 0]
28026 then
28027 pax -w -f archive .
28028 else
28029 echo Portable archive cannot be created.
28030 exit 1
28031 fi
```

28032 To verify that a user-supplied path name names a readable file and that the application can  
 28033 create a file extending the given path without truncation and without overwriting any existing  
 28034 file:

```
28035 case $- in
28036 *C*) reset="";;
28037 *) reset="set +C"
28038 set -C;;
28039 esac
28040 test -r "$path" && pathchk "$path.out" &&
28041 rm "$path.out" > "$path.out"
28042 if [$? -ne 0]; then
28043 printf "%s: %s not found or %s.out fails \
28044 creation checks.\n" $0 "$path" "$path"
28045 $reset # Reset the noclobber option in case a trap
28046 # on EXIT depends on it.
28047 exit 1
28048 fi
28049 $reset
28050 PROCESSING < "$path" > "$path.out"
```

28051 The following assumptions are made in this example:

- 28052 1. **PROCESSING** represents the code that is used by the application to use **\$path** once it is  
 28053 verified that **\$path.out** works as intended.
- 28054 2. The state of the *noclobber* option is unknown when this code is invoked and should be set  
 28055 on exit to the state it was in when this code was invoked. (The **reset** variable is used in this  
 28056 example to restore the initial state.)

## 3. Note the usage of:

```
rm "$path.out" > "$path.out"
```

- a. The *pathchk* command has already verified, at this point, that **\$path.out** is not truncated.
- b. With the *noclobber* option set, the shell verifies that **\$path.out** does not already exist before invoking *rm*.
- c. If the shell succeeded in creating **\$path.out**, *rm* removes it so that the application can create the file again in the **PROCESSING** step.
- d. If the **PROCESSING** step wants the file to exist already when it is invoked, the:

```
rm "$path.out" > "$path.out"
```

should be replaced with:

```
> "$path.out"
```

which verifies that the file did not already exist, but leaves **\$path.out** in place for use by **PROCESSING**.

**RATIONALE**

The *pathchk* utility is new, commissioned for this volume of IEEE Std. 1003.1-200x. It, along with the *set -C(noclobber)* option added to the shell, replaces the *mktemp*, *validfnam*, and *create* utilities that appeared in early proposals. All of these utilities were attempts to solve several common problems:

- Verify the validity (for several different definitions of “valid”) of a path name supplied by a user, generated by an application, or imported from an external source.
- Atomically create a file.
- Perform various string handling functions to generate a temporary file name.

The *create* utility, included in an early proposal, provided checking and atomic creation in a single invocation of the utility; these are orthogonal issues and need not be grouped into a single utility. Note that the *noclobber* option also provides a way of creating a lock for process synchronization; since it provides an atomic *create*, there is no race between a test for existence and the following creation if it did not exist.

Having a function like *tmpnam()* in the ISO C standard is important in many high-level languages. The shell programming language, however, has built-in string manipulation facilities, making it very easy to construct temporary file names. The names needed obviously depend on the application, but are frequently of a form similar to:

```
$TMPDIR/application_abbreviation$$$.suffix
```

In cases where there is likely to be contention for a given suffix, a simple shell *for* or *while* loop can be used with the shell *noclobber* option to create a file without risk of collisions, as long as applications trying to use the same file name namespace are cooperating on the use of files after they have been created.

**FUTURE DIRECTIONS**

None.

## 28100 NAME

28101 pax — portable archive interchange

## 28102 SYNOPSIS

28103 pax [-cdnv][-H|-L][-f archive][-s replstr]...[pattern...]

28104 pax -r[-cdiknuv][-H|-L][-f archive][-o options]...[-p string]...  
28105 [-s replstr]...[pattern...]28106 pax -w[-dituvX][-H|-L][-b blocksize][[-a][-f archive][-o options]...  
28107 [-s replstr]...[-x format][file...]28108 pax -r -w[-diklntuvX][-H|-L][-p string]...[-s replstr]...  
28109 [file...] directory

## 28110 DESCRIPTION

28111 *Notes to Reviewers*28112 *This section with side shading will not appear in the final copy. - Ed.*28113 *pax* has been extensively changed due to the merger with .2b.28114 The *pax* utility shall read, write, and write lists of the members of archive files and copy  
28115 directory hierarchies. A variety of archive formats shall be supported; see the *-x format* option.28116 The action to be taken depends on the presence of the *-r* and *-w* options. The four combinations  
28117 of *-r* and *-w* are referred to as the four modes of operation: **list**, **read**, **write**, and **copy** modes,  
28118 corresponding respectively to the four forms shown in the SYNOPSIS section.28119 **list** In **list** mode (when neither *-r* nor *-w* are specified), *pax* shall write the names of  
28120 the members of the archive file read from the standard input, with path names  
28121 matching the specified patterns, to standard output. If a named file is of type  
28122 directory, the file hierarchy rooted at that file shall be listed as well.28123 **read** In **read** mode (when *-r* is specified, but *-w* is not), *pax* shall extract the members of  
28124 the archive file read from the standard input, with path names matching the  
28125 specified patterns. If an extracted file is of type directory, the file hierarchy rooted  
28126 at that file shall be extracted as well. The extracted files shall be created relative to  
28127 the current file hierarchy.28128 The ownership, access, and modification times, and file mode of the restored files  
28129 are discussed under the *-p* option.28130 **write** In **write** mode (when *-w* is specified, but *-r* is not), *pax* shall write the contents of  
28131 the *file* operands to the standard output in an archive format. If no *file* operands are  
28132 specified, a list of files to copy, one per line, shall be read from the standard input.  
28133 A file of type directory shall include all of the files in the file hierarchy rooted at the  
28134 file.28135 **copy** In **copy** mode (when both *-r* and *-w* are specified), *pax* shall copy the *file* operands  
28136 to the destination directory.28137 If no *file* operands are specified, a list of files to copy, one per line, shall be read  
28138 from the standard input. A file of type directory shall include all of the files in the  
28139 file hierarchy rooted at the file.28140 The effect of the **copy** shall be as if the copied files were written to an archive file  
28141 and then subsequently extracted, except that there may be hard links between the  
28142 original and the copied files. If the destination directory is a subdirectory of one of  
28143 the files to be copied, the results are unspecified. If the destination directory is a

28144 file of a type not defined by the System Interfaces volume of IEEE Std. 1003.1-200x,  
 28145 the results are implementation-dependent; otherwise, it shall be an error for the file  
 28146 named by the *directory* operand not to exist, not be writable by the user, or not be a  
 28147 file of type *directory*.

28148 In **read** or **copy** modes, if intermediate directories are necessary to extract an archive member,  
 28149 *pax* shall perform actions equivalent to the *mkdir()* function defined in the System Interfaces  
 28150 volume of IEEE Std. 1003.1-200x, called with the following arguments:

- 28151 • The intermediate directory used as the *path* argument
- 28152 • The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO as the *mode*  
 28153 argument

28154 If any specified *pattern* or *file* operands are not matched by at least one file or archive member,  
 28155 *pax* shall write a diagnostic message to standard error for each one that did not match and exit  
 28156 with a non-zero exit status.

28157 The archive formats described in the EXTENDED DESCRIPTION section shall be automatically  
 28158 detected on input. The default output archive format shall be implementation-dependent.

28159 A single archive can span multiple files. The *pax* utility shall determine, in an implementation-  
 28160 dependent manner, what file to read or write as the next file.

28161 If the selected archive format supports the specification of linked files, it shall be an error if these  
 28162 files cannot be linked when the archive is extracted. For archive formats that do not store file  
 28163 contents with each name that causes a hard link, if the file that contains the data is not extracted  
 28164 during this *pax* session, either the data shall be restored from the original file, or a diagnostic  
 28165 message shall be displayed with the name of a file that can be used to extract the data. In  
 28166 traversing directories, *pax* shall detect infinite loops; that is, entering a previously visited  
 28167 directory that is an ancestor of the last file visited. When it detects an infinite loop, *pax* shall  
 28168 write a diagnostic message to standard error and shall terminate.

## 28169 OPTIONS

28170 The *pax* utility shall conform to the System Interface Definitions volume of  
 28171 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines, except that the order of  
 28172 presentation of the **-o**, **-p**, and **-s** options is significant.

28173 The following options shall be supported:

- 28174 **-r** Read an archive file from standard input.
- 28175 **-w** Write files to the standard output in the specified archive format.
- 28176 **-a** Append files to the end of the archive. It is implementation-dependent which  
 28177 devices on the system support appending. Additional file formats unspecified by  
 28178 this volume of IEEE Std. 1003.1-200x may impose restrictions on appending.
- 28179 **-b *blocksize*** Block the output at a positive decimal integer number of bytes per write to the  
 28180 archive file. Devices and archive formats may impose restrictions on blocking.  
 28181 Blocking shall be automatically determined on input. Portable applications shall  
 28182 not specify a *blocksize* value larger than 32 256. Default blocking when creating  
 28183 archives depends on the archive format. (See the **-x** option below.)
- 28184 **-c** Match all file or archive members except those specified by the *pattern* or *file*  
 28185 operands.
- 28186 **-d** Cause files of type *directory* being copied or archived or archive members of type  
 28187 *directory* being extracted or listed to match only the file or archive member itself  
 28188 and not the file hierarchy rooted at the file.

|       |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28189 | <b>-f archive</b> | Specify the path name of the input or output archive, overriding the default standard input (in <b>list</b> or <b>read</b> modes) or standard output ( <b>write</b> mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 28190 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 28191 | <b>-H</b>         | If a symbolic link referencing a file of type directory is specified on the command line, <i>pax</i> shall archive the file hierarchy rooted in the file referenced by the link, using the name of the link as the root of the file hierarchy. The default behavior shall be to archive the symbolic link itself.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 28192 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 28193 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 28194 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 28195 | <b>-i</b>         | Interactively rename files or archive members. For each archive member matching a <i>pattern</i> operand or file matching a <i>file</i> operand, a prompt shall be written to the file <b>/dev/tty</b> . The prompt shall contain the name of the file or archive member, but the format is otherwise unspecified. A line shall then be read from <b>/dev/tty</b> . If this line is blank, the file or archive member shall be skipped. If this line consists of a single period, the file or archive member shall be processed with no modification to its name. Otherwise, its name shall be replaced with the contents of the line. The <i>pax</i> utility shall immediately exit with a non-zero exit status if end-of-file is encountered when reading a response or if <b>/dev/tty</b> cannot be opened for reading and writing. |

| 28227 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 28228 | <b>Note:</b>      | Keywords are not expected to be file names, merely to follow the same character composition rules as portable file names.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 28229 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 28230 |                   | Keywords can be preceded with white space. The <i>value</i> field shall consist of zero or more characters; within <i>value</i> , the application shall precede any literal comma with a backslash, which shall be ignored, but preserves the comma as part of <i>value</i> . A comma as the final character, or a comma followed solely by white space as the final characters, in <i>options</i> shall be ignored. Multiple <b>-o</b> options can be specified; if                                                                                                                                                                                                                                                                                                                                                                   |
| 28231 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 28232 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 28233 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 28234 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

keywords given to these multiple **-o** options conflict, the keywords and values appearing later in command line sequence shall take precedence and the earlier shall be silently ignored. The following keyword values of *options* shall be supported for the file formats as indicated:

**delete=pattern**

(Applicable only to the **-x** *pax* format.) When used in **write** or **copy** mode, *pax* shall omit from extended header records that it produces any keywords matching the string pattern. When used in **read** or **list** mode, *pax* shall ignore any keywords matching the string pattern in the extended header records. In both cases, matching shall be performed using the pattern matching notation described in Section 2.13.1 on page 92 and Section 2.13.2 on page 93. For example:

**-o delete=security.\***

would suppress security-related information. See **pax Extended Header** on page 750 for extended header record keyword usage.

**exthdr.name=string**

(Applicable only to the **-x** *pax* format.) This keyword allows user control over the name that is written into the **ustar** header blocks for the extended header produced under the circumstances described in **pax Header Block** on page 749. The name shall be the contents of *string*, after the following character substitutions have been made:

| <i>string</i><br>Includes: | Replaced By:                                                                                                        |
|----------------------------|---------------------------------------------------------------------------------------------------------------------|
| %d                         | The directory name of the file, equivalent to the result of the <i>dirname</i> utility on the translated path name. |
| %f                         | The file name of the file, equivalent to the result of the <i>basename</i> utility on the translated path name.     |
| %%                         | A ' % ' character.                                                                                                  |

Any other ' % ' characters in *string* produce undefined results.

If no **-o exthdr.name=string** is specified, *pax* shall use the following default value:

%d/PaxHeaders/%f

**globexthdr.name=string**

(Applicable only to the **-x** *pax* format.) When used in **write** or **copy** mode with the appropriate options, *pax* creates global extended header records with **ustar** header blocks that will be treated as regular files by previous versions of *pax*. This keyword allows user control over the name that is written into the **ustar** header blocks for global extended header records. The name shall be the contents of *string*, after the following character substitutions have been made:

| <i>string</i><br>Includes: | Replaced By:                                                                                                       |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| %n                         | An integer that represents the sequence number of the global extended header record in the archive, starting at 1. |
| %%                         | A ' % ' character.                                                                                                 |

|       |                                                                                                       |                                                                                             |
|-------|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| 28279 | Any other ' % ' characters in <i>string</i> produce undefined results.                                |                                                                                             |
| 28280 | If no <b>-o globexthdr.name=string</b> is specified, <i>pax</i> shall use the following               |                                                                                             |
| 28281 | default value:                                                                                        |                                                                                             |
| 28282 | \$TMPDIR/GlobalHead.%n                                                                                |                                                                                             |
| 28283 | where \$TMPDIR represents the value of the <i>TMPDIR</i> environment variable. If                     |                                                                                             |
| 28284 | <i>TMPDIR</i> is not set, <i>pax</i> shall use <b>/tmp</b> .                                          |                                                                                             |
| 28285 | <b>invalid=action</b>                                                                                 |                                                                                             |
| 28286 | (Applicable only to the <b>-x pax</b> format.) This keyword allows user control over                  |                                                                                             |
| 28287 | the action <i>pax</i> takes upon encountering values in an extended header record                     |                                                                                             |
| 28288 | that, in <b>read</b> or <b>copy</b> mode, are invalid in the destination hierarchy or, in <b>list</b> |                                                                                             |
| 28289 | mode, cannot be written in the codeset and current locale of the                                      |                                                                                             |
| 28290 | implementation. The following are invalid values that shall be recognized by                          |                                                                                             |
| 28291 | <i>pax</i> :                                                                                          |                                                                                             |
| 28292 | — In <b>read</b> or <b>copy</b> mode, a file name or link name that contains character                |                                                                                             |
| 28293 | encodings invalid in the destination hierarchy. (For example, the name                                |                                                                                             |
| 28294 | may contain embedded NULs.)                                                                           |                                                                                             |
| 28295 | — In <b>read</b> or <b>copy</b> mode, a file name or link name that is longer than the                |                                                                                             |
| 28296 | maximum allowed in the destination hierarchy (for either a path name                                  |                                                                                             |
| 28297 | component or the entire path name).                                                                   |                                                                                             |
| 28298 | — In <b>list</b> mode, any character string value (file name, link name, user name,                   |                                                                                             |
| 28299 | and so on) that cannot be written in the codeset and current locale of the                            |                                                                                             |
| 28300 | implementation.                                                                                       |                                                                                             |
| 28301 | The following mutually-exclusive values of the <i>action</i> argument are                             |                                                                                             |
| 28302 | supported:                                                                                            |                                                                                             |
| 28303 | <b>bypass</b>                                                                                         | In <b>read</b> or <b>copy</b> mode, <i>pax</i> shall bypass the file, causing no            |
| 28304 |                                                                                                       | change to the destination hierarchy. In <b>list</b> mode, <i>pax</i> shall write            |
| 28305 |                                                                                                       | all requested valid values for the file, but its method for writing                         |
| 28306 |                                                                                                       | invalid values is unspecified.                                                              |
| 28307 | <b>rename</b>                                                                                         | In <b>read</b> or <b>copy</b> mode, <i>pax</i> shall act as if the <b>-i</b> option were in |
| 28308 |                                                                                                       | effect for each file with invalid file name or link name values,                            |
| 28309 |                                                                                                       | allowing the user to provide a replacement name interactively.                              |
| 28310 |                                                                                                       | In <b>list</b> mode, <i>pax</i> shall behave identically to the <b>bypass</b> action.       |
| 28311 | <b>UTF-8</b>                                                                                          | When used in <b>read</b> , <b>copy</b> , or <b>list</b> mode and a file name, link          |
| 28312 |                                                                                                       | name, owner name, or any other field in an extended header                                  |
| 28313 |                                                                                                       | record cannot be translated from the <i>pax</i> UTF-8 codeset format                        |
| 28314 |                                                                                                       | to the codeset and current locale of the implementation, <i>pax</i>                         |
| 28315 |                                                                                                       | shall use the actual UTF-8 encoding for the name.                                           |
| 28316 | <b>write</b>                                                                                          | In <b>read</b> or <b>copy</b> mode, <i>pax</i> shall write the file, translating or         |
| 28317 |                                                                                                       | truncating the name, regardless of whether this may overwrite                               |
| 28318 |                                                                                                       | an existing file with a valid name. In <b>list</b> mode, <i>pax</i> shall behave            |
| 28319 |                                                                                                       | identically to the <b>bypass</b> action.                                                    |
| 28320 |                                                                                                       | If no <b>-o invalid=</b> option is specified, <i>pax</i> shall act as if                    |
| 28321 |                                                                                                       | <b>-o invalid=bypass</b> were specified. Any overwriting of existing                        |
| 28322 |                                                                                                       | files that may be allowed by the <b>-o invalid=</b> actions shall be                        |
| 28323 |                                                                                                       | subject to permission ( <b>-p</b> ) and modification time ( <b>-u</b> )                     |
| 28324 |                                                                                                       | restrictions, and shall be suppressed if the <b>-k</b> option is also                       |

|       |                       |                                                                                                                         |
|-------|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| 28325 |                       | specified.                                                                                                              |
| 28326 | <b>linkdata</b>       | (Applicable only to the <b>-x pax</b> format.) In <b>write</b> mode, <i>pax</i> shall                                   |
| 28327 |                       | write the contents of a file to the archive even when that file is                                                      |
| 28328 |                       | merely a hard link to a file whose contents have already been                                                           |
| 28329 |                       | written to the archive.                                                                                                 |
| 28330 | <b>listopt=format</b> |                                                                                                                         |
| 28331 |                       | This keyword specifies the output format of the table of contents produced                                              |
| 28332 |                       | when the <b>-v</b> option is specified in <b>list</b> mode. See <b>List Mode Format</b>                                 |
| 28333 |                       | <b>Specifications</b> on page 745. To avoid ambiguity, the <b>listopt=format</b> shall be                               |
| 28334 |                       | the only or final <b>keyword=value</b> pair in a <b>-o</b> option-argument; all characters in                           |
| 28335 |                       | the remainder of the option-argument shall be considered part of the format                                             |
| 28336 |                       | string. When multiple <b>-olistopt=format</b> options are specified, the format                                         |
| 28337 |                       | strings shall be considered a single, concatenated string, evaluated in                                                 |
| 28338 |                       | command line order.                                                                                                     |
| 28339 | <b>times</b>          |                                                                                                                         |
| 28340 |                       | (Applicable only to the <b>-x pax</b> format.) When used in <b>write</b> or <b>copy</b> mode, <i>pax</i>                |
| 28341 |                       | shall include <b>atime</b> , <b>ctime</b> , and <b>mtime</b> extended header records for each file.                     |
| 28342 |                       | See <b>pax Extended Header File Times</b> on page 753.                                                                  |
| 28343 |                       | In addition to these keywords, if the <b>-x pax</b> format is specified, any of the                                     |
| 28344 |                       | keywords and values defined in <b>pax Extended Header</b> on page 750, including                                        |
| 28345 |                       | implementation extensions, can be used in <b>-o</b> option-arguments, in either of two                                  |
| 28346 |                       | modes:                                                                                                                  |
| 28347 | <b>keyword=value</b>  |                                                                                                                         |
| 28348 |                       | When used in <b>write</b> or <b>copy</b> mode, these keyword/value pairs shall be                                       |
| 28349 |                       | included at the beginning of the archive as <b>typeflag g</b> global extended header                                    |
| 28350 |                       | records. When used in <b>read</b> or <b>list</b> mode, these keyword/value pairs shall act                              |
| 28351 |                       | as if they had been at the beginning of the archive as <b>typeflag g</b> global                                         |
| 28352 |                       | extended header records.                                                                                                |
| 28353 | <b>keyword:=value</b> |                                                                                                                         |
| 28354 |                       | When used in <b>write</b> or <b>copy</b> mode, these keyword/value pairs shall be                                       |
| 28355 |                       | included as records at the beginning of a <b>typeflag x</b> extended header for each                                    |
| 28356 |                       | file. (This is equivalent to the equal-sign form except that it creates no                                              |
| 28357 |                       | <b>typeflag g</b> global extended header records.) When used in <b>read</b> or <b>list</b> mode,                        |
| 28358 |                       | these keyword/value pairs shall act as if they were included as records at the                                          |
| 28359 |                       | end of each extended header; thus, they shall override any global or file-                                              |
| 28360 |                       | specific extended header record keywords of the same names. For example, in                                             |
| 28361 |                       | the command:                                                                                                            |
| 28362 |                       | <code>pax -r -o "</code>                                                                                                |
| 28363 |                       | <code>gname:=mygroup,</code>                                                                                            |
| 28364 |                       | <code>" &lt;archive</code>                                                                                              |
| 28365 |                       | the group name will be forced to a new value for all files read from the                                                |
| 28366 |                       | archive.                                                                                                                |
| 28367 |                       | The precedences of <b>-o</b> keywords over various fields in the archive are described in                               |
| 28368 |                       | <b>pax Extended Header Keyword Precedence</b> on page 752.                                                              |
| 28369 | <b>-p string</b>      | Specify one or more file characteristic options (privileges). The <i>string</i> option-                                 |
| 28370 |                       | argument shall be a string specifying file characteristics to be retained or discarded                                  |
| 28371 |                       | on extraction. The string shall consist of the specification characters <b>a</b> , <b>e</b> , <b>m</b> , <b>o</b> , and |

28372 **p.** Other implementation-dependent characters can be included. Multiple  
 28373 characteristics can be concatenated within the same string and multiple **-p** options  
 28374 can be specified. The meaning of the specification characters are as follows:

28375 **a** Do not preserve file access times.

28376 **e** Preserve the user ID, group ID, file mode bits (see the System Interface  
 28377 Definitions volume of IEEE Std. 1003.1-200x, Section 3.173, File Mode Bits),  
 28378 access time, modification time, and any other implementation-dependent file  
 28379 characteristics.

28380 **m** Do not preserve file modification times.

28381 **o** Preserve the user ID and group ID.

28382 **p** Preserve the file mode bits. Other implementation-dependent file mode  
 28383 attributes may be preserved.

28384 In the preceding list, “preserve” indicates that an attribute stored in the archive  
 28385 shall be given to the extracted file, subject to the permissions of the invoking  
 28386 process. The access and modification times of the file shall be preserved unless  
 28387 otherwise specified with the **-p** option or not stored in the archive. All attributes  
 28388 that are not preserved shall be determined as part of the normal file creation action  
 28389 (see Section 1.7.1.4 on page 11).

28390 If neither the **e** nor the **o** specification character is specified, or the user ID and  
 28391 group ID are not preserved for any reason, *pax* shall not set the S\_ISUID and  
 28392 S\_ISGID bits of the file mode.

28393 If the preservation of any of these items fails for any reason, *pax* shall write a  
 28394 diagnostic message to standard error. Failure to preserve these items shall affect  
 28395 the final exit status, but shall not cause the extracted file to be deleted.

28396 If file characteristic letters in any of the *string* option-arguments are duplicated or  
 28397 conflict with each other, the ones given last shall take precedence. For example, if  
 28398 **-p eme** is specified, file modification times are preserved.

28399 **-s replstr** Modify file or archive member names named by *pattern* or *file* operands according  
 28400 to the substitution expression *replstr*, using the syntax of the *ed* utility. The  
 28401 concepts of “address” and “line” are meaningless in the context of the *pax* utility,  
 28402 and shall not be supplied. The format shall be:

28403 **-s /old/new/[gp]**

28404 where as in *ed*, *old* is a basic regular expression and *new* can contain an ampersand,  
 28405 ‘\n’ (where *n* is a digit), backreferences, or subexpression matching. The *old*  
 28406 string also shall be permitted to contain <newline> characters.

28407 Any non-null character can be used as a delimiter (‘/’ shown here). Multiple **-s**  
 28408 expressions can be specified; the expressions shall be applied in the order  
 28409 specified, terminating with the first successful substitution. The optional trailing  
 28410 ‘g’ is as defined in the *ed* utility. The optional trailing ‘p’ shall cause successful  
 28411 substitutions to be written to standard error. File or archive member names that  
 28412 substitute to the empty string shall be ignored when reading and writing archives.

28413 **-t** Cause the access times of the archived files to be the same as they were before  
 28414 being read by *pax*.

28415 **-u** Ignore files that are older (having a less recent file modification time) than a pre-  
 28416 existing file or archive member with the same name. In **read** mode, an archive

|       |                  |                                                                                                                                                 |
|-------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 28417 |                  | member with the same name as a file in the file system shall be extracted if the                                                                |
| 28418 |                  | archive member is newer than the file. In <b>write</b> mode, an archive file member with                                                        |
| 28419 |                  | the same name as a file in the file system shall be superseded if the file is newer                                                             |
| 28420 |                  | than the archive member. If <b>-a</b> is also specified, this is accomplished by appending                                                      |
| 28421 |                  | to the archive; otherwise, it is unspecified whether this is accomplished by actual                                                             |
| 28422 |                  | replacement in the archive or by appending to the archive. In <b>copy</b> mode, the file in                                                     |
| 28423 |                  | the destination hierarchy shall be replaced by the file in the source hierarchy or by                                                           |
| 28424 |                  | a link to the file in the source hierarchy if the file in the source hierarchy is newer.                                                        |
| 28425 | <b>-v</b>        | In <b>list</b> mode, produce a verbose table of contents (see the STDOUT section).                                                              |
| 28426 |                  | Otherwise, write archive member path names to standard error (see the STDERR                                                                    |
| 28427 |                  | section).                                                                                                                                       |
| 28428 | <b>-x format</b> | Specify the output archive format. The <i>pax</i> utility shall support the following                                                           |
| 28429 |                  | formats:                                                                                                                                        |
| 28430 | <b>cpio</b>      | The <i>cpio</i> interchange format; see the EXTENDED DESCRIPTION                                                                                |
| 28431 |                  | section. The default <i>blocksize</i> for this format for character special                                                                     |
| 28432 |                  | archive files shall be 5120. Implementations shall support all                                                                                  |
| 28433 |                  | <i>blocksize</i> values less than or equal to 32 256 that are multiples of 512.                                                                 |
| 28434 | <b>pax</b>       | The <i>pax</i> interchange format; see the EXTENDED DESCRIPTION                                                                                 |
| 28435 |                  | section. The default <i>blocksize</i> for this format for character special                                                                     |
| 28436 |                  | archive files shall be 5120. Implementations shall support all                                                                                  |
| 28437 |                  | <i>blocksize</i> values less than or equal to 32 256 that are multiples of 512.                                                                 |
| 28438 | <b>ustar</b>     | The <i>tar</i> interchange format; see the EXTENDED DESCRIPTION                                                                                 |
| 28439 |                  | section. The default <i>blocksize</i> for this format for character special                                                                     |
| 28440 |                  | archive files shall be 10 240. Implementations shall support all                                                                                |
| 28441 |                  | <i>blocksize</i> values less than or equal to 32 256 that are multiples of 512.                                                                 |
| 28442 |                  | Implementation-dependent formats shall specify a default block size as well as any                                                              |
| 28443 |                  | other block sizes supported for character special archive files.                                                                                |
| 28444 |                  | Any attempt to append to an archive file in a format different from the existing                                                                |
| 28445 |                  | archive format shall cause <i>pax</i> to exit immediately with a non-zero exit status.                                                          |
| 28446 |                  | In <b>copy</b> mode, if no <b>-x</b> format is specified, <i>pax</i> shall behave as if <b>-xpax</b> were                                       |
| 28447 |                  | specified.                                                                                                                                      |
| 28448 | <b>-X</b>        | When traversing the file hierarchy specified by a path name, <i>pax</i> shall not descend                                                       |
| 28449 |                  | into directories that have a different device ID ( <i>st_dev</i> ; see the System Interfaces                                                    |
| 28450 |                  | volume of IEEE Std. 1003.1-200x, <i>stat()</i> ).                                                                                               |
| 28451 |                  | The options that operate on the names of files or archive members ( <b>-c</b> , <b>-i</b> , <b>-n</b> , <b>-s</b> , <b>-u</b> , and <b>-v</b> ) |
| 28452 |                  | shall interact as follows. In <b>read</b> mode, the archive members shall be selected based on the user-                                        |
| 28453 |                  | specified <i>pattern</i> operands as modified by the <b>-c</b> , <b>-n</b> , and <b>-u</b> options. Then, any <b>-s</b> and <b>-i</b> options   |
| 28454 |                  | shall modify, in that order, the names of the selected files. The <b>-v</b> option shall write names                                            |
| 28455 |                  | resulting from these modifications.                                                                                                             |
| 28456 |                  | In <b>write</b> mode, the files shall be selected based on the user-specified path names as modified by                                         |
| 28457 |                  | the <b>-n</b> and <b>-u</b> options. Then, any <b>-s</b> and <b>-i</b> options shall modify, in that order, the names of                        |
| 28458 |                  | these selected files. The <b>-v</b> option shall write names resulting from these modifications.                                                |
| 28459 |                  | If both the <b>-u</b> and <b>-n</b> options are specified, <i>pax</i> shall not consider a file selected unless it is newer                     |
| 28460 |                  | than the file to which it is compared.                                                                                                          |

## 28461 List Mode Format Specifications

28462 In **list** mode with the **-o listopt=format** option, the *format* argument shall be applied for each  
 28463 selected file. The *pax* utility shall append a <newline> character to the **listopt** output for each  
 28464 selected file. The *format* argument shall be used as the *format* string described in the System  
 28465 Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 5, File Format Notation, with the  
 28466 exceptions 1. through 5. defined in the EXTENDED DESCRIPTION section of *printf*, plus the  
 28467 following exceptions:

28468 6. The sequence (*keyword*) can occur before a format conversion specifier. The conversion  
 28469 argument is defined by the value of *keyword*. The implementation shall support the  
 28470 following keywords:

28471 — Any of the Field Name entries in Table 4-13 on page 753 and Table 4-15 on page 757. The  
 28472 implementation may support the *cpio* keywords without the leading **c\_** in addition to the  
 28473 form required by Table 4-16 on page 758.

28474 — Any keyword defined for the extended header in **pax Extended Header** on page 750.

28475 — Any keyword provided as an implementation-dependent extension within the extended  
 28476 header defined in **pax Extended Header** on page 750.

28477 For example, the sequence "%(charset)s" is the string value of the name of the character  
 28478 set in the extended header.

28479 The result of the keyword conversion argument shall be the value from the applicable  
 28480 header field or extended header, without any trailing NULs.

28481 All keyword values used as conversion arguments shall be translated from the UTF-8  
 28482 encoding to the character set appropriate for the local file system, user database, and so on,  
 28483 as applicable.

28484 7. An additional conversion character, **T**, shall be used to specify time formats. The **T**  
 28485 conversion character can be preceded by the sequence (*keyword=subformat*), where *subformat*  
 28486 is a date format as defined by *date* operands. The default *keyword* shall be **mtime** and the  
 28487 default subformat shall be:

28488 %b %e %H:%M %Y

28489 8. An additional conversion character, **M**, shall be used to specify the file mode string as  
 28490 defined in *ls* Standard Output. If (*keyword*) is omitted, the **mode** keyword shall be used. For  
 28491 example, **%1M** writes the single character corresponding to the <entry type> field of the *ls*  
 28492 **-l** command.

28493 9. An additional conversion character, **D**, shall be used to specify the device for block or  
 28494 special files, if applicable, in an implementation-dependent format. If not applicable, and  
 28495 (*keyword*) is specified, then this conversion shall be equivalent to %(*keyword*)**u**. If not  
 28496 applicable, and (*keyword*) is omitted, then this conversion shall be equivalent to <space>.

28497 10. An additional conversion character, **F**, shall be used to specify a path name. The **F**  
 28498 conversion character can be preceded by a sequence of comma-separated keywords:

28499 (*keyword*[ ,*keyword*] . . . )

28500 The values for all the keywords that are non-null shall be concatenated together, each  
 28501 separated by a ' / '. The default shall be (**path**) if the keyword **path** is defined; otherwise,  
 28502 the default shall be (**prefix,name**).

28503 11. An additional conversion character, **L**, shall be used to specify a symbolic line expansion. If  
 28504 the current file is a symbolic link, then **%L** shall expand to:

|       |                                                                                                                     |  |
|-------|---------------------------------------------------------------------------------------------------------------------|--|
| 28505 | "%s -> %s", <value of keyword>, <contents of link>                                                                  |  |
| 28506 | Otherwise, the %L conversion character shall be the equivalent of %F.                                               |  |
| 28507 | <b>OPERANDS</b>                                                                                                     |  |
| 28508 | The following operands shall be supported:                                                                          |  |
| 28509 | <i>directory</i> The destination directory path name for <b>copy</b> mode.                                          |  |
| 28510 | <i>file</i> A path name of a file to be copied or archived.                                                         |  |
| 28511 | <i>pattern</i> A pattern matching one or more path names of archive members. A pattern must                         |  |
| 28512 | be given in the name-generating notation of the pattern matching notation in                                        |  |
| 28513 | Section 2.13 on page 92, including the file name expansion rules in Section 2.13.3                                  |  |
| 28514 | on page 94. The default, if no <i>pattern</i> is specified, is to select all members in the                         |  |
| 28515 | archive.                                                                                                            |  |
| 28516 | <b>STDIN</b>                                                                                                        |  |
| 28517 | In <b>write</b> mode, the standard input shall be used only if no <i>file</i> operands are specified. It shall be a |  |
| 28518 | text file containing a list of path names, one per line, without leading or trailing <blank>                        |  |
| 28519 | characters.                                                                                                         |  |
| 28520 | In <b>list</b> and <b>read</b> modes, if <b>-f</b> is not specified, the standard input shall be an archive file.   |  |
| 28521 | Otherwise, the standard input shall not be used.                                                                    |  |
| 28522 | <b>INPUT FILES</b>                                                                                                  |  |
| 28523 | The input file named by the <i>archive</i> option-argument, or standard input when the archive is read              |  |
| 28524 | from there, shall be a file formatted according to one of the specifications in the EXTENDED                        |  |
| 28525 | DESCRIPTION section or some other implementation-dependent format.                                                  |  |
| 28526 | The file <b>/dev/tty</b> shall be used to write prompts and read responses.                                         |  |
| 28527 | <b>ENVIRONMENT VARIABLES</b>                                                                                        |  |
| 28528 | The following environment variables shall affect the execution of <i>pax</i> :                                      |  |
| 28529 | <i>LANG</i> Provide a default value for the internationalization variables that are unset or null.                  |  |
| 28530 | If <i>LANG</i> is unset or null, the corresponding value from the implementation-                                   |  |
| 28531 | dependent default locale shall be used. If any of the internationalization variables                                |  |
| 28532 | contains an invalid setting, the utility shall behave as if none of the variables had                               |  |
| 28533 | been defined.                                                                                                       |  |
| 28534 | <i>LC_ALL</i> If set to a non-empty string value, override the values of all the other                              |  |
| 28535 | internationalization variables.                                                                                     |  |
| 28536 | <i>LC_COLLATE</i>                                                                                                   |  |
| 28537 | Determine the locale for the behavior of ranges, equivalence classes and multi-                                     |  |
| 28538 | character collating elements used in the pattern matching expressions for the                                       |  |
| 28539 | <i>pattern</i> operand, the basic regular expression for the <b>-s</b> option, and the extended                     |  |
| 28540 | regular expression defined for the <b>yesexpr</b> locale keyword in the <i>LC_MESSAGES</i>                          |  |
| 28541 | category.                                                                                                           |  |
| 28542 | <i>LC_CTYPE</i> Determine the locale for the interpretation of sequences of bytes of text data as                   |  |
| 28543 | characters (for example, single-byte as opposed to multi-byte characters in                                         |  |
| 28544 | arguments and input files), the behavior of character classes used in the extended                                  |  |
| 28545 | regular expression defined for the <b>yesexpr</b> locale keyword in the <i>LC_MESSAGES</i>                          |  |
| 28546 | category, and pattern matching.                                                                                     |  |
| 28547 | <i>LC_MESSAGES</i>                                                                                                  |  |
| 28548 | Determine the locale for the processing of affirmative responses that should be                                     |  |

28549                   used to affect the format and contents of diagnostic messages written to standard  
28550                   error.

28551           **LC\_TIME**   Determine the format and contents of date and time strings when the **-v** option is  
28552                   specified.

28553 **XSI**       **NLSPATH**   Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

28554           **TMPDIR**   Determine the path name that provides part of the default global extended header  
28555                   record file, as described for the **-o globexthdr=** keyword as described in the  
28556                   OPTIONS section.

28557 **ASYNCHRONOUS EVENTS**

28558           Default.

28559 **STDOUT**

28560           In **write** mode, if **-f** is not specified, the standard output shall be the archive formatted  
28561           according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
28562           implementation-dependent format (see **-x format**).

28563           In **list** mode, when the **-olistopt=format** has been specified, the selected archive members shall  
28564           be written to standard output using the format described under **List Mode Format**  
28565           **Specifications** on page 745. In **list** mode without the **-olistopt=format** option, the table of  
28566           contents of the the selected archive members shall be written to standard output using the  
28567           following format:

28568           "%s\n", <path name>

28569           If the **-v** option is specified in **list** mode, the table of contents of the selected archive members  
28570           shall be written to standard output using the following formats.

28571           For path names representing hard links to previous members of the archive:

28572           "%sΔ=Δ%s\n", <ls -l listing>, <linkname>

28573           For all other path names:

28574           "%s\n", <ls -l listing>

28575           where <ls -l listing> shall be the format specified by the **ls** utility with the **-l** option. When  
28576           writing path names in this format, it is unspecified what is written for fields for which the  
28577           underlying archive format does not have the correct information, although the correct number of  
28578           <blank> character-separated fields shall be written.

28579           In **list** mode, standard output shall not be buffered more than a line at a time.

28580 **STDERR**

28581           If **-v** is specified in **read**, **write**, or **copy** modes, **pax** shall write the path names it processes to the  
28582           standard error output using the following format:

28583           "%s\n", <path name>

28584           These path names shall be written as soon as processing is begun on the file or archive member,  
28585           and shall be flushed to standard error. The trailing <newline> character, which shall not be  
28586           buffered, is written when the file has been read or written.

28587           If the **-s** option is specified, and the replacement string has a trailing 'p', substitutions shall be  
28588           written to standard error in the following format:

28589           "%sΔ>>Δ%s\n", <original path name>, <new path name>

28590 In all operating modes of *pax*, optional messages of unspecified format concerning the input  
 28591 archive format and volume number, the number of files, blocks, volumes, and media parts as  
 28592 well as other diagnostic messages may be written to standard error.

28593 In all formats, for both standard output and standard error, it is unspecified how non-printable  
 28594 characters in path names or link names are written.

28595 When *pax* is in **read** mode or **list** mode, using the **-xpax** archive format, and a file name, link  
 28596 name, owner name, or any other field in an extended header record cannot be translated from  
 28597 the *pax* UTF-8 codeset format to the codeset and current locale of the implementation, *pax* shall  
 28598 write a diagnostic message to standard error, shall process the file as described for the **-o**  
 28599 **invalid=option**, and then shall process the next file in the archive.

## 28600 OUTPUT FILES

28601 In **read** mode, the extracted output files shall be of the archived file type. In **copy** mode, the  
 28602 copied output files shall be the type of the file being copied. In either mode, existing files in the  
 28603 destination hierarchy shall be overwritten only when all permission (**-p**), modification time (**-u**),  
 28604 and invalid-value (**-oinvalid=**) tests allow it.

28605 In **write** mode, the output file named by the **-f** option-argument shall be a file formatted  
 28606 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
 28607 implementation-dependent format.

## 28608 EXTENDED DESCRIPTION

### 28609 **pax Interchange Format**

28610 A *pax* archive tape or file produced in the **-xpax** format shall contain a series of blocks. The  
 28611 physical layout of the archive shall be identical to the **ustar** format described in **ustar**  
 28612 **Interchange Format** on page 753. Each file archived shall be represented by the following  
 28613 sequence:

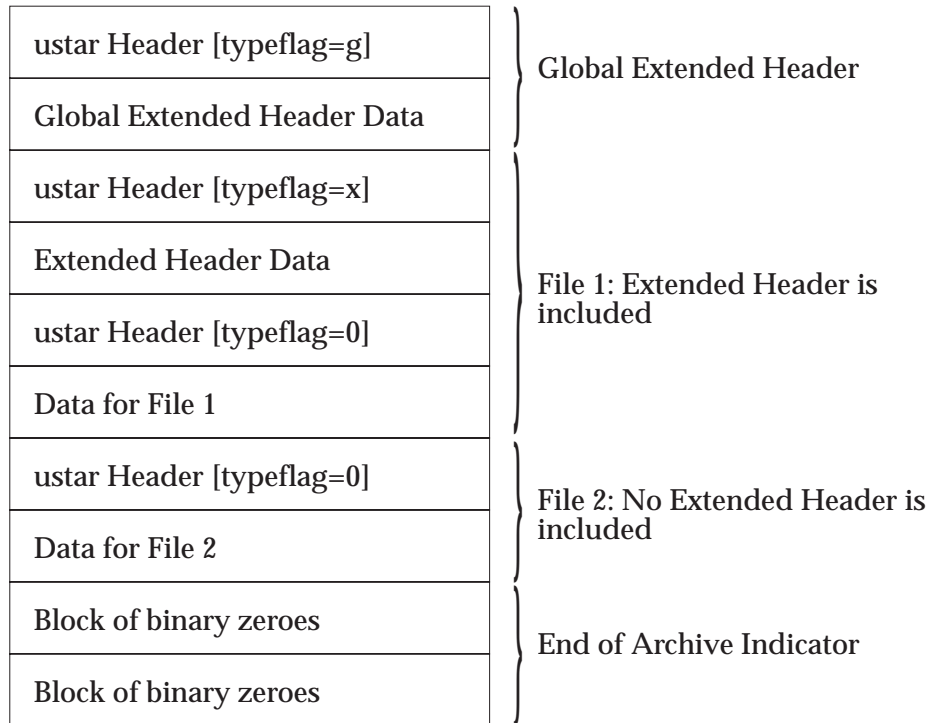

- 28614 • An optional header block with extended header records. This header block is of the form  
 28615 described in **pax Header Block** on page 749, with a *typeflag* value of **x** or **g**. The extended  
 28616 header records, described in **pax Extended Header** on page 750, are included as the data for  
 28617 this header block.
- 28618 • A header block that describes the file. Any fields in the preceding optional extended header  
 28619 override the associated fields in this header block for this file.
- 28620 • Zero or more blocks that contain the contents of the file.

28621 At the end of the archive file there shall be two 512-byte blocks filled with binary zeroes,  
 28622 interpreted as an end-of-archive indicator.

28623 A schematic of an example archive with global extended header records and two actual files is  
 28624 shown in Figure 4-1 on page 749. In the example, the second file in the archive has no extended  
 28625 header preceding it, presumably because it has no need for extended attributes.

28626

28627

Figure 4-1 pax Format Archive Example

28628

**pax Header Block**

28629

The *pax* header block shall be identical to the **ustar** header block described in **ustar Interchange Format** on page 753, except that two additional *typeflag* values are defined:

28630

28631

**x** Represents extended header records for the following file in the archive (which shall have its own **ustar** header block). The format of these extended header records shall be as described in **pax Extended Header** on page 750.

28632

28633

28634

**g** Represents global extended header records for the following files in the archive. The format of these extended header records shall be as described in **pax Extended Header** on page 750. Each value shall affect all subsequent files that do not override that value in their own extended header record and until another global extended header record is reached that provides another value for the same field. The *typeflag g* global headers should not be used with interchange media that could suffer partial data loss in transporting the archive.

28635

28636

28637

28638

28639

28640

For both of these types, the *size* field shall be the size of the extended header records in octets. The other fields in the header block are not meaningful to this version of the *pax* utility. However, if this archive is read by a *pax* utility conforming to a previous version of IEEE Std. 1003.1-200x, the header block fields are used to create a regular file that contains the extended header records as data. Therefore, header block field values should be selected to provide reasonable file access to this regular file.

28641

28642

28643

28644

28645

28646

A further difference from the **ustar** header block is that data blocks for files of *typeflag 1* (hard link) may be included, which means that the *size* field may be greater than zero. Archives created by **pax -o linkdata** shall include these data blocks with the hard links.

28647

28648

28649 **pax Extended Header**

28650 A *pax* extended header contains values that are inappropriate for the **ustar** header block because  
 28651 of limitations in that format: fields requiring a character encoding other than that described in  
 28652 the ISO/IEC 646:1991 standard, fields representing file attributes not described in the **ustar**  
 28653 header, and fields whose format or length do not fit the requirements of the **ustar** header. The  
 28654 values in an extended header add attributes to the following file (or files; see the description of  
 28655 the *typeflag g* header block) or override values in the following header block(s), as indicated in  
 28656 the following list of keywords.

28657 An extended header shall consist of one or more records, each constructed as follows:

28658 "%d %s=%s\n", <length>, <keyword>, <value>

28659 The extended header records shall be encoded according to the ISO/IEC 10646-1:1993 standard  
 28660 (UTF-8). The <length> field, <blank> character, equals sign, and <newline> character shown  
 28661 shall be limited to the portable character set, as encoded in UTF-8. The <keyword> and <value>  
 28662 fields can be any UTF-8 characters. The <length> field shall be the decimal length of the extended  
 28663 header record in octets, including the trailing <newline> character.

28664 The <keyword> field shall be one of the entries from the following list or a keyword provided as  
 28665 an implementation extension. Keywords consisting entirely of lowercase letters, digits, and  
 28666 periods are reserved for future standardization. A keyword shall not include an equals sign. (In  
 28667 the following list, the notations “file(s)” or “block(s)” is used to acknowledge that a keyword  
 28668 affects the following single file after a *typeflag x* extended header, but possibly multiple files after  
 28669 *typeflag g*. Any requirements in the list for *pax* to include a record when in **write** or **copy** mode  
 28670 shall apply only when such a record has not already been provided through the use of the **-o**  
 28671 option. When used in **copy** mode, *pax* shall behave as if an archive had been created with  
 28672 applicable extended header records and then extracted.)

28673 **atime** The file access time for the following file(s), equivalent to the value of the *st\_atime*  
 28674 member of the **stat** structure for a file, as described by the *stat()* function. The  
 28675 access time shall be restored if the process has the appropriate privilege required  
 28676 to do so. The format of the <value> shall be as described in **pax Extended Header**  
 28677 **File Times** on page 753.

28678 **charset** The name of the character set used to encode the data in the following file(s). The  
 28679 entries in the following table are defined to refer to known standards; additional  
 28680 names may be agreed on between the originator and recipient.

| <value>                 | Formal Standard               |
|-------------------------|-------------------------------|
| ISO-IRA646Δ1990         | ISO/IEC 646:1990              |
| ISO-IRA8859Δ1Δ1987      | ISO/IEC 8859-1:1987           |
| ISO-IRA8859Δ2Δ1987      | ISO/IEC 8859-2:1987           |
| ISO-IRA10646Δ1993       | ISO/IEC 10646:1993            |
| ISO-IRA10646Δ1993ΔUTF-8 | ISO/IEC 10646, UTF-8 encoding |
| BINARY                  | None.                         |

28688 The encoding is included in an extended header for information only; when *pax* is  
 28689 used as described in IEEE Std. 1003.1-200x, it shall not translate the file data into  
 28690 any other encoding. The **BINARY** entry indicates unencoded binary data.

28691 When used in **write** or **copy** mode, it is implementation-dependent whether *pax*  
 28692 includes a **charset** extended header record for a file.

28693 **comment** A series of characters used as a comment. All characters in the <value> field shall  
 28694 be ignored by *pax*.

|       |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28695 | <b>ctime</b>        | The file creation time for the following file(s), equivalent to the value of the <i>st_ctime</i> member of the <b>stat</b> structure for a file, as described by the <i>stat()</i> function. The creation time shall be restored if the process has the appropriate privilege required to do so. The format of the <value> shall be as described in <b>pax Extended Header File Times</b> on page 753.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 28696 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 28700 | <b>gid</b>          | The group ID of the group that owns the file, expressed as a decimal number using digits from the ISO/IEC 646:1991 standard. This record shall override the <i>gid</i> field in the following header block(s). When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include a <i>gid</i> extended header record for each file whose group ID is greater than 99 999 999.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 28704 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 28705 | <b>gname</b>        | The group of the file(s), formatted as a group name in the group database. This record shall override the <i>gid</i> and <i>gname</i> fields in the following header block(s), and any <i>gid</i> extended header record. When used in <b>read</b> , <b>copy</b> , or <b>list</b> mode, <i>pax</i> shall translate the name from the UTF-8 encoding in the header record to the character set appropriate for the group database on the receiving system. If any of the UTF-8 characters cannot be translated, and if the <b>-oinvalid=</b> UTF-8 option is not specified, the results are implementation-dependent. When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include a <b>gname</b> extended header record for each file whose group name cannot be represented entirely with the letters and digits of the portable character set.                                                                |
| 28706 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 28715 | <b>linkpath</b>     | The path name of a link being created to another file, of any type, previously archived. This record shall override the <i>linkname</i> field in the following <b>ustar</b> header block(s). The following <b>ustar</b> header block shall determine the type of link created. If <i>typeflag</i> of the following header block is 1, it shall be a hard link. If <i>typeflag</i> is 2, it shall be a symbolic link and the <b>linkpath</b> value shall be the contents of the symbolic link. The <i>pax</i> utility shall translate the name of the link (contents of the symbolic link) from the UTF-8 encoding to the character set appropriate for the local file system. When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include a <b>linkpath</b> extended header record for each link whose path name cannot be represented entirely with the members of the portable character set other than NUL. |

|-------|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| 28743 |                                               | <i>size</i> extended header record for each file with a size value greater than                                       |
| 28744 |                                               | 999 999 999 999.                                                                                                      |
| 28745 | <b>uid</b>                                    | The user ID of the file owner, expressed as a decimal number using digits from the                                    |
| 28746 |                                               | ISO/IEC 646:1991 standard. This record shall override the <i>uid</i> field in the                                     |
| 28747 |                                               | following header block(s). When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include a                  |
| 28748 |                                               | <i>uid</i> extended header record for each file whose owner ID is greater than 99 999 999.                            |
| 28749 | <b>uname</b>                                  | The owner of the following file(s), formatted as a user name in the user database.                                    |
| 28750 |                                               | This record shall override the <i>uid</i> and <i>uname</i> fields in the following header block(s),                   |
| 28751 |                                               | and any <i>uid</i> extended header record. When used in <b>read</b> , <b>copy</b> , or <b>list</b> mode, <i>pax</i>   |
| 28752 |                                               | shall translate the name from the UTF-8 encoding in the header record to the                                          |
| 28753 |                                               | character set appropriate for the user database on the receiving system. If any of                                    |
| 28754 |                                               | the UTF-8 characters cannot be translated, and if the <b>-oinvalid=</b> UTF-8 option is                               |
| 28755 |                                               | not specified, the results are implementation-dependent. When used in <b>write</b> or                                 |
| 28756 |                                               | <b>copy</b> mode, <i>pax</i> shall include a <b>uname</b> extended header record for each file whose                  |
| 28757 |                                               | user name cannot be represented entirely with the letters and digits of the portable                                  |
| 28758 |                                               | character set.                                                                                                        |
| 28759 |                                               | If the <i>&lt;value&gt;</i> field is zero length, it shall delete any header block field, previously entered          |
| 28760 |                                               | extended header value, or global extended header value of the same name.                                              |
| 28761 |                                               | If a keyword in an extended header record (or in a <b>-o</b> option-argument) overrides or deletes a                  |
| 28762 |                                               | corresponding field in the <b>ustar</b> header block, <i>pax</i> shall ignore the contents of that header block       |
| 28763 |                                               | field.                                                                                                                |
| 28764 |                                               | Unlike the <b>ustar</b> header block fields, NULs shall not delimit <i>&lt;value&gt;</i> s; all characters within the |
| 28765 |                                               | <i>&lt;value&gt;</i> field shall be considered data for the field. None of the length limitations of the <b>ustar</b> |
| 28766 |                                               | header block fields in Table 4-13 on page 753 shall apply to the extended header records.                             |
| 28767 | <b>pax Extended Header Keyword Precedence</b> |                                                                                                                       |
| 28768 |                                               | This section describes the precedence in which the various header records and fields and                              |
| 28769 |                                               | command line options are selected to apply to a file in the archive. When <i>pax</i> is used in <b>read</b> or        |
| 28770 |                                               | <b>list</b> modes, it shall determine a file attribute in the following sequence:                                     |
| 28771 | 1.                                            | If <b>-odelete=keyword-prefix</b> is used, the affected attributes shall be determined from step 7.,                  |
| 28772 |                                               | if applicable, or ignored otherwise.                                                                                  |
| 28773 | 2.                                            | If <b>-okeyword:=</b> is used, the affected attributes shall be ignored.                                              |
| 28774 | 3.                                            | If <b>-okeyword:=value</b> is used, the affected attribute shall be assigned the value.                               |
| 28775 | 4.                                            | If there is a <i>typeflag</i> <b>x</b> extended header record, the affected attribute shall be assigned the           |
| 28776 |                                               | <i>&lt;value&gt;</i> . When extended header records conflict, the last one given in the header shall take             |
| 28777 |                                               | precedence.                                                                                                           |
| 28778 | 5.                                            | If <b>-okeyword=value</b> is used, the affected attribute shall be assigned the value.                                |
| 28779 | 6.                                            | If there is a <i>typeflag</i> <b>g</b> global extended header record, the affected attribute shall be                 |
| 28780 |                                               | assigned the <i>&lt;value&gt;</i> . When global extended header records conflict, the last one given in               |
| 28781 |                                               | the global header shall take precedence.                                                                              |
| 28782 | 7.                                            | Otherwise, the attribute shall be determined from the <b>ustar</b> header block.                                      |

### 28783 **pax Extended Header File Times**

28784 The *pax* utility shall write **atime** and **ctime** records for each file in **write** or **copy** modes only if  
 28785 the **-otimes** option is specified; *pax* shall write a **mtime** record for each file in **write** or **copy**  
 28786 modes if the file system of the underlying implementation supports time granularities smaller  
 28787 than that required by the **ustar** header block described in **ustar Interchange Format**. All of these  
 28788 time records shall be formatted as a decimal representation of the time in seconds since the  
 28789 Epoch. If a period ( ' . ' ) decimal point character is present, the digits to the right of the point  
 28790 shall represent the units of a subsecond timing granularity, where the first digit is tenths of a  
 28791 second and each subsequent digit is a tenth of the previous digit. Implementations may ignore  
 28792 any portion of the subsecond digits for which they do not support the necessary timing  
 28793 granularity; they shall not perform any rounding operation.

### 28794 **ustar Interchange Format**

28795 A **ustar** archive tape or file shall contain a series of blocks. Each block shall be a fixed-size block  
 28796 of 512 octets (see below). Although this format may be thought of as being stored on 9-track  
 28797 industry-standard 12.7mm (0.5in) magnetic tape, other types of transportable media are not  
 28798 excluded. Each file archived shall be represented by a header block that describes the file,  
 28799 followed by zero or more blocks that give the contents of the file. At the end of the archive file  
 28800 there shall be two 512-octet blocks filled with binary zeros, interpreted as an end-of-archive  
 28801 indicator.

28802 The blocks may be grouped for physical I/O operations, as described under the **-bblocksize** and  
 28803 **-x ustar** options. Each group of blocks may be written with a single operation equivalent to the  
 28804 *write()* function. On magnetic tape, the result of this write shall be a single tape record. The last  
 28805 group of blocks always shall be at the full size, so blocks after the two zero blocks may contain  
 28806 undefined data.

28807 The header block shall be structured as shown in the following table. All lengths and offsets are  
 28808 in decimal.

28809 **Table 4-13** ustar Header Block

| Field Name      | Octet Offset | Length (in Octets) |
|-----------------|--------------|--------------------|
| <i>name</i>     | 0            | 100                |
| <i>mode</i>     | 100          | 8                  |
| <i>uid</i>      | 108          | 8                  |
| <i>gid</i>      | 116          | 8                  |
| <i>size</i>     | 124          | 12                 |
| <i>mtime</i>    | 136          | 12                 |
| <i>chksum</i>   | 148          | 8                  |
| <i>typeflag</i> | 156          | 1                  |
| <i>linkname</i> | 157          | 100                |
| <i>magic</i>    | 257          | 6                  |
| <i>version</i>  | 263          | 2                  |
| <i>uname</i>    | 265          | 32                 |
| <i>gname</i>    | 297          | 32                 |
| <i>devmajor</i> | 329          | 8                  |
| <i>devminor</i> | 337          | 8                  |
| <i>prefix</i>   | 345          | 155                |

28827 All characters in the header block shall be represented in the coded character set of the  
 28828 ISO/IEC 646:1991 standard. For maximum portability between implementations, names should  
 28829 be selected from characters represented by the portable file name character set as octets with the

28830 most significant bit zero. If an implementation supports the use of characters outside of slash  
 28831 and the portable file name character set in names for files, users, and groups, one or more  
 28832 implementation-dependent encodings of these characters shall be provided for interchange  
 28833 purposes.

#### 28834 **Notes to Reviewers**

28835 *This section with side shading will not appear in the final copy. - Ed.*

28836 The following paragraph was in XCU and is not in 1003.2b  
 28837 However, the *pax* utility shall never create file names on the local system that cannot be accessed  
 28838 via the procedures described previously in this volume of IEEE Std. 1003.1-200x. If a file name is  
 28839 found on the medium that would create an invalid file name, it is implementation-dependent  
 28840 whether the data from the file is stored on the file hierarchy and under what name it is stored.  
 28841 The *pax* utility may choose to ignore these files as long as it produces an error indicating that the  
 28842 file is being ignored.

28843 Each field within the header block is contiguous; that is, there is no padding used. Each character  
 28844 on the archive medium shall be stored contiguously.

28845 The fields *magic*, *uname*, and *gname* are character strings each terminated by a NUL character.  
 28846 The fields *name*, *linkname*, and *prefix* are NUL-terminated character strings except when all  
 28847 characters in the array contain non-NUL characters including the last character. The *version* field  
 28848 is two octets containing the characters "00" (zero-zero). The *typeflag* contains a single character.  
 28849 All other fields are leading zero-filled octal numbers using digits from the ISO/IEC 646:1991  
 28850 standard IRV. Each numeric field is terminated by one or more <space> or NUL characters.

28851 The *name* and the *prefix* fields shall produce the path name of the file. A new path name shall be  
 28852 formed, if *prefix* is not an empty string (its first character is not NUL), by concatenating *prefix* (up  
 28853 to the first NUL character), a slash character, and *name*; otherwise, *name* is used alone. In either  
 28854 case, *name* is terminated at the first NUL character. If *prefix* begins with a NUL character, it shall  
 28855 be ignored. In this manner, path names of at most 256 characters can be supported. If a path  
 28856 name does not fit in the space provided, *pax* shall notify the user of the error, and shall not store  
 28857 any part of the file—header or data—on the medium.

28858 The *linkname* field, described below, shall not use the *prefix* to produce a path name. As such, a  
 28859 *linkname* is limited to 100 characters. If the name does not fit in the space provided, *pax* shall  
 28860 notify the user of the error, and shall not attempt to store the link on the medium.

28861 The *mode* field provides 12 bits encoded in the ISO/IEC 646:1991 standard octal digit  
 28862 representation. The encoded bits shall represent the following values:

Table 4-14 ustar mode Field

| Bit Value | IEEE Std. 1003.1-200x Bit | Description                                     |
|-----------|---------------------------|-------------------------------------------------|
| 04 000    | S_ISUID                   | Set UID on execution.                           |
| 02 000    | S_ISGID                   | Set GID on execution.                           |
| 01 000    | <reserved>                | Reserved for future standardization.            |
| 00 400    | S_IRUSR                   | Read permission for file owner class.           |
| 00 200    | S_IWUSR                   | Write permission for file owner class.          |
| 00 100    | S_IXUSR                   | Execute/search permission for file owner class. |
| 00 040    | S_IRGRP                   | Read permission for file group class.           |
| 00 020    | S_IWGRP                   | Write permission for file group class.          |
| 00 010    | S_IXGRP                   | Execute/search permission for file group class. |
| 00 004    | S_IROTH                   | Read permission for file other class.           |
| 00 002    | S_IWOTH                   | Write permission for file other class.          |
| 00 001    | S_IXOTH                   | Execute/search permission for file other class. |

When appropriate privilege is required to set one of these mode bits, and the user restoring the files from the archive does not have the appropriate privilege, the mode bits for which the user does not have appropriate privilege shall be ignored. Some of the mode bits in the archive format are not mentioned elsewhere in this volume of IEEE Std. 1003.1-200x. If the implementation does not support those bits, they may be ignored.

The *uid* and *gid* fields are the user and group ID of the owner and group of the file, respectively.

The *size* field is the size of the file in octets. If the *typeflag* field is set to specify a file to be of type 1 (a link) or 2 (reserved for symbolic links), the *size* field shall be specified as zero. If the *typeflag* field is set to specify a file of type 5 (directory), the *size* field shall be interpreted as described under the definition of that record type. No data blocks are stored for types 1, 2, or 5. If the *typeflag* field is set to 3 (character special file), 4 (block special file), or 6 (FIFO), the meaning of the *size* field is unspecified by this volume of IEEE Std. 1003.1-200x, and no data blocks shall be stored on the medium. Additionally, for 6, the *size* field shall be ignored when reading. If the *typeflag* field is set to any other value, the number of blocks written following the header shall be  $(size+511)/512$ , ignoring any fraction in the result of the division.

The *mtime* field shall be the modification time of the file at the time it was archived. It is the ISO/IEC 646:1991 standard representation of the octal value of the modification time obtained from the *stat()* function.

The *chksum* field shall be the ISO/IEC 646:1991 standard IRV representation of the octal value of the simple sum of all octets in the header block. Each octet in the header shall be treated as an unsigned value. These values shall be added to an unsigned integer, initialized to zero, the precision of which is not less than 17 bits. When calculating the checksum, the *chksum* field is treated as if it were all spaces.

The *typeflag* field specifies the type of file archived. If a particular implementation does not recognize the type, or the user does not have appropriate privilege to create that type, the file shall be extracted as if it were a regular file if the file type is defined to have a meaning for the *size* field that could cause data blocks to be written on the medium (see the previous description for *size*). If conversion to a regular file occurs, the *pax* utility shall produce an error indicating that the conversion took place. All of the *typeflag* fields shall be coded in the ISO/IEC 646:1991 standard IRV:

0 Represents a regular file. For backward compatibility, a *typeflag* value of binary zero ('`\0`') should be recognized as meaning a regular file when extracting files from the archive. Archives written with this version of the archive file format create regular files with a *typeflag* value of the ISO/IEC 646:1991 standard IRV '`0`'.

|       |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28911 | 1    | Represents a file linked to another file, of any type, previously archived. Such files are identified by each file having the same device and file serial number. The linked-to name is specified in the <i>linkname</i> field with a NUL-character terminator if it is less than 100 octets in length.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 28912 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 28921 | 5    | Specifies a directory or subdirectory. On systems where disk allocation is performed on a directory basis, the <i>size</i> field shall contain the maximum number of octets (which may be rounded to the nearest disk block allocation unit) that the directory may hold. A <i>size</i> field of zero indicates no such limiting. Systems that do not support limiting in this manner should ignore the <i>size</i> field.                                                                                                                                                                                                                                                                                                            |

| 28933 |      | The <i>magic</i> field is the specification that this archive was output in this archive format. If this field contains <b>ustar</b> (the five characters from the ISO/IEC 646:1991 standard IRV shown followed by NUL), the <i>uname</i> and <i>gname</i> fields shall contain the ISO/IEC 646:1991 standard IRV representation of the owner and group of the file, respectively (truncated to fit, if necessary). When the file is restored by a privileged, protection-preserving version of the utility, the user and group databases shall be scanned for these names. If found, the user and group IDs contained within these files shall be used rather than the values contained within the <i>uid</i> and <i>gid</i> fields. |

| 28942 |      | The octet-oriented <i>cpio</i> archive format shall be a series of entries, each comprising a header that describes the file, the name of the file, and then the contents of the file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 28943 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 28944 |      | An archive may be recorded as a series of fixed-size blocks of octets. This blocking shall be used only to make physical I/O more efficient. The last group of blocks shall be always at the full size.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 28945 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 28946 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 28947 |      | For the octet-oriented <i>cpio</i> archive format, the individual entry information shall be in the order indicated and described by the following table; see also the < <b>cpio.h</b> > header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 28948 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 4-15 Octet-Oriented *cpio* Archive Entry

| Header Field Name    | Length (in Octets) | Interpreted as   |
|----------------------|--------------------|------------------|
| <i>c_magic</i>       | 6                  | Octal number     |
| <i>c_dev</i>         | 6                  | Octal number     |
| <i>c_ino</i>         | 6                  | Octal number     |
| <i>c_mode</i>        | 6                  | Octal number     |
| <i>c_uid</i>         | 6                  | Octal number     |
| <i>c_gid</i>         | 6                  | Octal number     |
| <i>c_nlink</i>       | 6                  | Octal number     |
| <i>c_rdev</i>        | 6                  | Octal number     |
| <i>c_mtime</i>       | 11                 | Octal number     |
| <i>c_namesize</i>    | 6                  | Octal number     |
| <i>c_filesize</i>    | 11                 | Octal number     |
| File Name Field Name | Length             | Interpreted as   |
| <i>c_name</i>        | <i>c_namesize</i>  | Path name string |
| File Data Field Name | Length             | Interpreted as   |
| <i>c_filedata</i>    | <i>c_filesize</i>  | Data             |

**cpio Header**

For each file in the archive, a header as defined previously shall be written. The information in the header fields is written as streams of the ISO/IEC 646: 1991 standard characters interpreted as octal numbers. The octal numbers shall be extended to the necessary length by appending the ISO/IEC 646: 1991 standard IRV zeros at the most-significant-digit end of the number; the result is written to the most-significant digit of the stream of octets first. The fields shall be interpreted as follows:

|                             |                                                                                                                                                                                                                                                       |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>c_magic</i>              | Identify the archive as being a transportable archive by containing the identifying value "070707".                                                                                                                                                   |
| <i>c_dev</i> , <i>c_ino</i> | Contains values that uniquely identify the file within the archive (that is, no files contain the same pair of <i>c_dev</i> and <i>c_ino</i> values unless they are links to the same file). The values shall be determined in an unspecified manner. |
| <i>c_mode</i>               | Contains the file type and access permissions as defined in the following table.                                                                                                                                                                      |

Table 4-16 Values for *cpio c\_mode* Field

| File Permissions Name | Value    | Indicates              |
|-----------------------|----------|------------------------|
| C_IRUSR               | 000 400  | Read by owner          |
| C_IWUSR               | 000 200  | Write by owner         |
| C_IXUSR               | 000 100  | Execute by owner       |
| C_IRGRP               | 000 040  | Read by group          |
| C_IWGRP               | 000 020  | Write by group         |
| C_IXGRP               | 000 010  | Execute by group       |
| C_IROTH               | 000 004  | Read by others         |
| C_IWOTH               | 000 002  | Write by others        |
| C_IXOTH               | 000 001  | Execute by others      |
| C_ISUID               | 004 000  | Set <i>uid</i>         |
| C_ISGID               | 002 000  | Set <i>gid</i>         |
| C_ISVTX               | 001 000  | Reserved               |
| File Type Name        | Value    | Indicates              |
| C_ISDIR               | 040 000  | Directory              |
| C_ISFIFO              | 010 000  | FIFO                   |
| C_ISREG               | 0100 000 | Regular file           |
| C_ISBLK               | 060 000  | Block special file     |
| C_ISCHR               | 020 000  | Character special file |
| C_ISCTG               | 0110 000 | Reserved               |
| C_ISLNK               | 0120 000 | Reserved               |
| C_ISSOCK              | 0140 000 | Reserved               |

Directories, FIFOs, and regular files shall be supported on a system conforming to this volume of IEEE Std. 1003.1-200x; additional values defined previously are reserved for compatibility with existing systems. Additional file types may be supported; however, such files should not be written to archives intended to be transported to other systems.

|                   |                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>c_uid</i>      | Contains the user ID of the owner.                                                                                      |
| <i>c_gid</i>      | Contains the group ID of the group.                                                                                     |
| <i>c_nlink</i>    | Contains the number of links referencing the file at the time the archive was created.                                  |
| <i>c_rdev</i>     | Contains implementation-dependent information for character or block special files.                                     |
| <i>c_mtime</i>    | Contains the latest time of modification of the file at the time the archive was created.                               |
| <i>c_namesize</i> | Contains the length of the path name, including the terminating NUL character.                                          |
| <i>c_filesize</i> | Contains the length of the file in octets. This shall be the length of the data section following the header structure. |

## 29018 **cpio File Name**

29019 The `c_name` field shall contain the path name of the file. The length of this field in octets is the  
 29020 value of `c_namesize`.

## 29021 **Notes to Reviewers**

29022 *This section with side shading will not appear in the final copy. - Ed.*

29023 The following paragraph in XCU is not present in 1003.2b. Comments?

29024 If a file name is found on the medium that would create an invalid path name, it is  
 29025 implementation-dependent whether the data from the file is stored on the file hierarchy and  
 29026 under what name it is stored.

29027 All characters shall be represented in the ISO/IEC 646:1991 standard IRV. For maximum  
 29028 portability between implementations, names should be selected from characters represented by  
 29029 the portable file name character set as octets with the most significant bit zero. If an  
 29030 implementation supports the use of characters outside the portable file name character set in  
 29031 names for files, users, and groups, one or more implementation-dependent encodings of these  
 29032 characters shall be provided for interchange purposes.

## 29033 **Notes to Reviewers**

29034 *This section with side shading will not appear in the final copy. - Ed.*

29035 The next sentence is in XCU but not in 1003.2b

29036 However, the `pax` utility shall never create file names on the local system that cannot be accessed  
 29037 via the procedures described previously in this volume of IEEE Std. 1003.1-200x. If a file name is  
 29038 found on the medium that would create an invalid file name, it is implementation-dependent  
 29039 whether the data from the file is stored on the local file system and under what name it is stored.  
 29040 The `pax` utility may choose to ignore these files as long as it produces an error indicating that the  
 29041 file is being ignored.

## 29042 **cpio File Data**

29043 Following `c_name`, there shall be `c_filesiz` octets of data. Interpretation of such data occurs in a  
 29044 manner dependent on the file. If `c_filesiz` is zero, no data shall be contained in `c_filedata`.

## 29045 **Notes to Reviewers**

29046 *This section with side shading will not appear in the final copy. - Ed.*

29047 The following bullet items are in XCU but not in 1003.2b. Comments?

29048 When restoring from an archive:

- 29049 • If the user does not have the appropriate privilege to create a file of the specified type, `pax`  
 29050 shall ignore the entry and write an error message to standard error.
- 29051 • Only regular files have data to be restored. Presuming a regular file meets any selection  
 29052 criteria that might be imposed on the format-reading utility by the user, such data shall be  
 29053 restored.
- 29054 • If a user does not have appropriate privilege to set a particular mode flag, the flag shall be  
 29055 ignored. Some of the mode flags in the archive format are not mentioned elsewhere in this  
 29056 volume of IEEE Std. 1003.1-200x. If the implementation does not support those flags, they  
 29057 may be ignored.

29058 **cpio Special Entries**

29059 FIFO special files, directories, and the trailer shall be recorded with *c\_filesize* equal to zero. For  
 29060 other special files, *c\_filesize* is unspecified by this volume of IEEE Std. 1003.1-200x. The header  
 29061 for the next file entry in the archive shall be written directly after the last octet of the file entry  
 29062 preceding it. A header denoting the file name **TRAILER!!!** indicates the end of the archive; the  
 29063 contents of octets in the last block of the archive following such a header are undefined.

29064 **EXIT STATUS**

29065 The following exit values shall be returned:

29066     **0** All files were processed successfully.

29067     **>0** An error occurred.

29068 **CONSEQUENCES OF ERRORS**

29069 If *pax* cannot create a file or a link when reading an archive or cannot find a file when writing an  
 29070 archive, or cannot preserve the user ID, group ID, or file mode when the **-p** option is specified, a  
 29071 diagnostic message shall be written to standard error and a non-zero exit status shall be  
 29072 returned, but processing shall continue. In the case where *pax* cannot create a link to a file, *pax*  
 29073 shall not, by default, create a second copy of the file.

29074 If the extraction of a file from an archive is prematurely terminated by a signal or error, *pax* may  
 29075 have only partially extracted the file or (if the **-n** option was not specified) may have extracted a  
 29076 file of the same name as that specified by the user, but which is not the file the user wanted.  
 29077 Additionally, the file modes of extracted directories may have additional bits from the *S\_IRWXU*  
 29078 mask set as well as incorrect modification and access times.

29079 **APPLICATION USAGE**

29080 The **-p** (privileges) option was invented to reconcile differences between historical *tar* and *cpio*  
 29081 implementations. In particular, the two utilities use **-m** in diametrically opposed ways. The **-p**  
 29082 option also provides a consistent means of extending the ways in which future file attributes can  
 29083 be addressed, such as for enhanced security systems or high-performance files. Although it may  
 29084 seem complex, there are really two modes that are most commonly used:

29085     **-p e**     “Preserve everything”. This would be used by the historical superuser, someone with  
 29086 all the appropriate privileges, to preserve all aspects of the files as they are recorded in  
 29087 the archive. The **e** flag is the sum of **o** and **p**, and other implementation-dependent  
 29088 attributes.

29089     **-p p**     “Preserve” the file mode bits. This would be used by the user with regular privileges  
 29090 who wished to preserve aspects of the file other than the ownership. The file times are  
 29091 preserved by default, but two other flags are offered to disable these and use the time  
 29092 of extraction.

29093 The one path name per line format of standard input precludes path names containing  
 29094 <newline> characters. Although such path names violate the portable file name guidelines, they  
 29095 may exist and their presence may inhibit usage of *pax* within shell scripts. This problem is  
 29096 inherited from historical archive programs. The problem can be avoided by listing file name  
 29097 arguments on the command line instead of on standard input.

29098 It is almost certain that appropriate privileges are required for *pax* to accomplish parts of this  
 29099 volume of IEEE Std. 1003.1-200x. Specifically, creating files of type block special or character  
 29100 special, restoring file access times unless the files are owned by the user (the **-t** option), or  
 29101 preserving file owner, group, and mode (the **-p** option) all probably require appropriate  
 29102 privileges.

29103 In **read** mode, implementations are permitted to overwrite files when the archive has multiple  
 29104 members with the same name. This may fail if permissions on the first version of the file do not  
 29105 permit it to be overwritten.

29106 The *cpio* and **ustar** formats can only support files up to 8 gigabytes in size.

#### 29107 EXAMPLES

29108 The following command:

```
29109 pax -w -f /dev/rmt/lm .
```

29110 copies the contents of the current directory to tape drive 1, medium density (assuming historical  
 29111 System V device naming procedures. The historical BSD device name would be **/dev/rmt9**).

29112 The following commands:

```
29113 mkdir newdir
```

```
29114 pax -rw olddir newdir
```

29115 copy the *olddir* directory hierarchy to *newdir*.

```
29116 pax -r -s ',^//*usr//*,,' -f a.pax
```

29117 reads the archive **a.pax**, with all files rooted in **/usr** in the archive extracted relative to the current  
 29118 directory.

29119 Using the option:

```
29120 -o listopt="%M %(atime)T %(size)D %(name)s"
```

29121 overrides the default output description in Standard Output and instead writes:

```
29122 -rw-rw--- Jan 12 15:53 1492 /usr/foo/bar
```

29123 Using the options:

```
29124 -o listopt='%L\t%(size)D\n%.7' \
```

```
29125 -o listopt='(name)s\n%(ctime)T\n%T'
```

29126 overrides the default output description in Standard Output and instead writes:

```
29127 /usr/foo/bar -> /tmp 1492
```

```
29128 /usr/fo
```

```
29129 Jan 12 1991
```

```
29130 Jan 31 15:53
```

#### 29131 RATIONALE

29132 The *pax* utility was new, commissioned for the ISO POSIX-2:1993 standard. It represents a  
 29133 peaceful compromise between advocates of the historical *tar* and *cpio* utilities.

29134 A fundamental difference between *cpio* and *tar* was in the way directories were treated. The *cpio*  
 29135 utility did not treat directories differently from other files, and to select a directory and its  
 29136 contents required that each file in the hierarchy be explicitly specified. For *tar*, a directory  
 29137 matched every file in the file hierarchy it rooted.

29138 The *pax* utility offers both interfaces; by default, directories map into the file hierarchy they root.  
 29139 The **-d** option causes *pax* to skip any file not explicitly referenced, as *cpio* historically did. The *tar*  
 29140 **-style** behavior was chosen as the default because it was believed that this was the more  
 29141 common usage and because *tar* is the more commonly available interface, as it was historically  
 29142 provided on both System V and BSD implementations.

29143 The data interchange format specification in this volume of IEEE Std. 1003.1-200x requires that  
 29144 processes with “appropriate privileges” shall always restore the ownership and permissions of

29145 extracted files exactly as archived. If viewed from the historic equivalence between superuser  
29146 and “appropriate privileges”, there are two problems with this requirement. First, users running  
29147 as superusers may unknowingly set dangerous permissions on extracted files. Second, it is  
29148 needlessly limiting, in that superusers cannot extract files and own them as superuser unless the  
29149 archive was created by the superuser. (It should be noted that restoration of ownerships and  
29150 permissions for the superuser, by default, is historical practice in *cpio*, but not in *tar*.) In order to  
29151 avoid these two problems, the *pax* specification has an additional “privilege” mechanism, the **-p**  
29152 option. Only a *pax* invocation with the privileges needed, and which has the **-p** option set using  
29153 the **e** specification character, has the “appropriate privilege” to restore full ownership and  
29154 permission information.

29155 Note also that this volume of IEEE Std. 1003.1-200x requires that the file ownership and access  
29156 permissions shall be set, on extraction, in the same fashion as the *creat()* function when provided  
29157 the mode stored in the archive. This means that the file creation mask of the user is applied to  
29158 the file permissions.

29159 Users should note that directories may be created by *pax* while extracting files with permissions  
29160 that are different from those that existed at the time the archive was created. When extracting  
29161 sensitive information into a directory hierarchy that no longer exists, users are encouraged to set  
29162 their file creation mask appropriately to protect these files during extraction.

29163 The table of contents output is written to standard output to facilitate pipeline processing.

29164 The one path name per line format of standard input precludes path names containing  
29165 <newline> characters. Although such path names violate the portable file name guidelines, they  
29166 may exist and their presence may inhibit usage of *pax* within shell scripts. This problem is  
29167 inherited from historical archive programs. The problem can be avoided by listing file name  
29168 arguments on the command line instead of on standard input.

29169 An early proposal had hard links displaying for all path names. This was removed because it  
29170 complicates the output of the case where **-v** is not specified and does not match historical *cpio*  
29171 usage. The hard-link information is available in the **-v** display.

29172 The archive formats inherited from the POSIX.1-1990 standard have certain restrictions that  
29173 have been brought along from historical usage. For example, there are restrictions on the length  
29174 of path names stored in the archive. When *pax* is used in **copy( -rw)** mode (copying directory  
29175 hierarchies), the ability to use extensions from the **-xpax** format overcomes these restrictions.

29176 The default *blocksize* value of 5 120 bytes for *cpio* was selected because it is one of the standard  
29177 block-size values for *cpio*, set when the **-B** option is specified. (The other default block-size value  
29178 for *cpio* is 512 bytes, and this was considered to be too small.) The default block value of 10 240  
29179 bytes for *tar* was selected because that is the standard block-size value for BSD *tar*. The  
29180 maximum block size of 32 256 bytes ( $2^{15}$ –512 bytes) is the largest multiple of 512 bytes that fits  
29181 into a signed 16-bit tape controller transfer register. There are known limitations in some  
29182 historical systems that would prevent larger blocks from being accepted. Historical values were  
29183 chosen to improve compatibility with historical scripts using *dd* or similar utilities to manipulate  
29184 archives. Also, default block sizes for any file type other than character special file has been  
29185 deleted from this volume of IEEE Std. 1003.1-200x as unimportant and not likely to affect the  
29186 structure of the resulting archive.

29187 Implementations are permitted to modify the block-size value based on the archive format or  
29188 the device to which the archive is being written. This is to provide implementations with the  
29189 opportunity to take advantage of special types of devices, and it should not be used without a  
29190 great deal of consideration as it almost certainly decreases archive portability.

29191 The intended use of the **-n** option was to permit extraction of one or more files from the archive  
29192 without processing the entire archive. This was viewed by the standard developers as offering

significant performance advantages over historical implementations. The `-n` option in early proposals had three effects; the first was to cause special characters in patterns to not be treated specially. The second was to cause only the first file that matched a pattern to be extracted. The third was to cause *pax* to write a diagnostic message to standard error when no file was found matching a specified pattern. Only the second behavior is retained by this volume of IEEE Std. 1003.1-200x, for many reasons. First, it is in general not acceptable for a single option to have multiple effects. Second, the ability to make pattern matching characters act as normal characters is useful for parts of *pax* other than file extraction. Third, a finer degree of control over the special characters is useful because users may wish to normalize only a single special character in a single file name. Fourth, given a more general escape mechanism, the previous behavior of the `-n` option can be easily obtained using the `-s` option or a *sed* script. Finally, writing a diagnostic message when a pattern specified by the user is unmatched by any file is useful behavior in all cases.

In this version, the `-n` was removed from the **copy** mode synopsis of *pax*; it is inapplicable because there are no pattern operands specified in this mode.

There is another method than *pax* for copying subtrees in IEEE Std. 1003.1-200x described as part of the *cp* utility. Both methods are historical practice: *cp* provides a simpler, more intuitive interface, while *pax* offers a finer granularity of control. Each provides additional functionality to the other; in particular, *pax* maintains the hard-link structure of the hierarchy while *cp* does not. It is the intention of the standard developers that the results be similar (using appropriate option combinations in both utilities). The results are not required to be identical; there seemed insufficient gain to applications to balance the difficulty of implementations having to guarantee that the results would be exactly identical.

A single archive may span more than one file. It is suggested that implementations provide informative messages to the user on standard error whenever the archive file is changed.

The `-d` option (do not create intermediate directories not listed in the archive) found in early proposals was originally provided as a complement to the historic `-d` option of *cpio*. It has been deleted.

The `-s` option in early proposals specified a subset of the substitution command from the *ed* utility. As there was no reason for only a subset to be supported, the `-s` option is now compatible with the current *ed* specification. Since the delimiter can be any non-null character, the following usage with single spaces is valid:

```
pax -s " foo bar " ...
```

The `-t` option (specify an implementation-dependent identifier naming an input or output device) found in early proposals has been deleted because it is not historical practice and is of limited utility. In particular, historic versions of neither *cpio* nor *tar* had the concept of devices that were not mapped into the file system; if the devices are mapped into the file system, the `-f` option is sufficient.

The default behavior of *pax* with regard to file modification times is the same as historical implementations of *tar*. It is not the historical behavior of *cpio*.

Because the `-i` option uses `/dev/tty`, utilities without a controlling terminal are not able to use this option.

The `-y` option, found in early proposals, has been deleted because a line containing a single period for the `-i` option has equivalent functionality. The special lines for the `-i` option (a single period and the empty line) are historical practice in *cpio*.

In early drafts, an `-echarmap` option was included to increase portability of files between systems using different coded character sets. This option was omitted because it was apparent that

29240 consensus could not be formed for it. In this version, the use of UTF-8 should be an adequate  
29241 substitute.

29242 The **-k** option was added to address international concerns about the dangers involved in the  
29243 character set transformations of **-e** (if the target character set were different than the source, the  
29244 file names might be transformed into names matching existing files) and also was made more  
29245 general to protect files transferred between file systems with different {NAME\_MAX} values  
29246 (truncating a file name on a smaller system might also inadvertently overwrite existing files). As  
29247 stated, it prevents any overwriting, even if the target file is older than the source. This version  
29248 adds more granularity of options to solve this problem by introducing the **-oinvalid=** option—  
29249 specifically the UTF-8 action. (Note that an existing file that is named with a UTF-8 encoding is  
29250 still subject to overwriting in this case. The **-k** option closes that loophole.)

29251 Some of the file characteristics referenced in this volume of IEEE Std. 1003.1-200x might not be  
29252 supported by some archive formats. For example, neither the *tar* nor *cpio* formats contain the file  
29253 access time. For this reason, the **e** specification character has been provided, intended to cause all  
29254 file characteristics specified in the archive to be retained.

29255 It is required that extracted directories, by default, have their access and modification times and  
29256 permissions set to the values specified in the archive. This has obvious problems in that the  
29257 directories are almost certainly modified after being extracted and that directory permissions  
29258 may not permit file creation. One possible solution is to create directories with the mode  
29259 specified in the archive, as modified by the *umask* of the user, with sufficient permissions to  
29260 allow file creation. After all files have been extracted, *pax* would then reset the access and  
29261 modification times and permissions as necessary.

29262 The list-mode formatting description borrows heavily from the one defined by the *printf* utility.  
29263 However, since there is no separate operand list to get conversion arguments, the format was  
29264 extended to allow specifying the name of the conversion argument as part of the conversion  
29265 specification.

29266 The **T** specifier allows time fields to be displayed in any of the date formats. Unlike the *ls* utility,  
29267 *pax* does not adjust the format when the date is less than six months in the past. This makes  
29268 parsing the output more predictable.

29269 The **D** specifier handles the ability to display the major/minor or file size, as with *ls*, by using  
29270 **%-8(size)D**.

29271 The **L** specifier handles the *ls* display for symbolic links.

29272 Conversion specifiers were added to generate existing known types used for *ls*.

### 29273 **pax Interchange Format**

29274 The new POSIX data interchange format was developed primarily to satisfy international  
29275 concerns that the **ustar** and *cpio* formats did not provide for file, user, and group names encoded  
29276 in characters outside a subset of the ISO/IEC 646:1991 standard. The standard developers  
29277 realized that this new POSIX data interchange format should be very extensible because there  
29278 were other requirements they foresaw in the near future:

- 29279 • Support international character encodings and locale information
- 29280 • Support security information (ACLs, and so on)
- 29281 • Support future file types, such as realtime or contiguous files
- 29282 • Include data areas for implementation use

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 29283 | <ul style="list-style-type: none"> <li>• Support systems with words larger than 32 bits and timers with subsecond granularity</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 29284 | The following were not goals for this format because these are better handled by separate utilities or are inappropriate for a portable format:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 29285 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 29298 | The new format was designed with one additional goal in mind: reasonable behavior when an older <i>tar</i> or <i>pax</i> utility happened to read an archive. Since the POSIX.1-1990 standard mandated that a “format-reading utility” had to treat unrecognized <i>typeflag</i> values as regular files, this allowed the format to include all the extended information in a pseudo-regular file that preceded each real file. An option is given that allows the archive creator to set up reasonable names for these files on the older systems. Also, the normative text suggests that reasonable file access values be used for this <b>ustar</b> header block. Making these header files inaccessible for convenient reading and deleting would not be reasonable. File permissions of 600 or 700 are suggested. |

| 29305 | The <b>ustar</b> <i>typeflag</i> field was used to accommodate the additional functionality of the new format rather than magic or version because the POSIX.1-1990 standard (and, by reference, the previous version of <i>pax</i> ), mandated the behavior of the format-reading utility when it encountered an unknown <i>typeflag</i> , but was silent about the other two fields.                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 29308 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 29309 | Early proposals of the first revision to IEEE Std. 1003.1-200x contained a proposed archive format that was based on compatibility with the standard for tape files (ISO 1001, similar to the format used historically on many mainframes and minicomputers). This format was overly complex and required considerable overhead in volume and header records. Furthermore, the standard developers felt that it would not be acceptable to the community of POSIX developers, so it was later changed to be a format more closely related to historical practice on POSIX systems.                                                                                                                                                                                                                                      |

| 29318 | The concept of a global extended header ( <i>typeflag</i> g) was controversial. If this were applied to an archive being recorded on magnetic tape, a few unreadable blocks at the beginning of the tape could be a serious problem; a utility attempting to extract as many files as possible from a damaged archive could lose a large percentage of file header information in this case. However, if the archive were on a reliable medium, such as a CD-ROM, the global extended header offers considerable potential size reductions by eliminating redundant information. Thus, the text warns against using the global method for unreliable media and provides a method for implanting global information in the extended header for each file, rather than in the <i>typeflag</i> g records.                  |

| 29325 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 29326 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 29327 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 29328 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

29329 No facility for data translation or filtering on a per-file basis is included because the standard  
 29330 developers could not invent an interface that would allow this in an efficient manner. If a filter,  
 29331 such as encryption or compression, is to be applied to all the files, it is more efficient to apply the  
 29332 filter to the entire archive as a single file. The standard developers considered interfaces that  
 29333 would invoke a shell script for each file going into or out of the archive, but the system overhead  
 29334 in this approach was considered to be too high.

29335 One such approach would be to have **filter=** records that give a path name for an executable.  
 29336 When the program is invoked, the file and archive would be open for standard input/output  
 29337 and all the header fields would be available as environment variables or command-line  
 29338 arguments. The standard developers did discuss such schemes, but they were omitted from  
 29339 IEEE Std. 1003.1-200x due to concerns about excessive overhead. Also, the program itself would  
 29340 need to be in the archive if it were to be used portably.

29341 There is currently no portable means of identifying the character set(s) used for a file in the file  
 29342 system. Therefore, *pax* has not been given a mechanism to generate charset records  
 29343 automatically. The only portable means of doing this is for the user to write the archive using the  
 29344 **-ocharset=string** command line option. This assumes that all of the files in the archive use the  
 29345 same encoding. The “implementation-dependent” text is included to allow for a system that can  
 29346 identify the encodings used for each of its files.

29347 The table of standards that accompanies the charset record description is acknowledged to be  
 29348 very limited. Only a limited number of character set standards is reasonable for maximal  
 29349 interchange. Any character set is, of course, possible by prior agreement. It was suggested that  
 29350 EBCDIC be listed, but it was omitted because it is not defined by a formal standard. Formal  
 29351 standards, and then only those with reasonably large followings, can be included here, simply as  
 29352 a matter of practicality. The *<value>s* represent names of officially registered charactersets in the  
 29353 format required by the ISO 2375:1985 standard.

29354 The normal comma or *<blank>*-separated list rules are not followed in the case of keyword  
 29355 options to allow ease of argument parsing for *getopts*.

29356 Further information on character encodings is in **pax Archive Character Set Encoding/Decoding**  
 29357 on page 768.

29358 The standard developers have reserved keyword name space for vendor extensions. It is  
 29359 suggested that the format to be used is:

29360 *VENDOR.keyword*

29361 where *VENDOR* is the name of the vendor or organization in all uppercase letters. It is further  
 29362 suggested that the keyword following the period be named differently than any of the standard  
 29363 keywords so that it could be used for future standardization, if appropriate, by omitting the  
 29364 *VENDOR* prefix.

29365 The *<length>* field in the extended header record was included to make it simpler to step  
 29366 through the records, even if a record contains an unknown format (to a particular *pax*) with  
 29367 complex interactions of special characters. It also provides a minor integrity checkpoint within  
 29368 the records to aid a program attempting to recover files from a damaged archive.

29369 There are no extended header versions of the *devmajor* and *devminor* fields because the  
 29370 unspecified format **ustar** header field should be sufficient. If they are not, vendor-specific  
 29371 extended keywords (such as *VENDOR.devmajor*) should be used.

29372 Device and *i*-number labeling of files was not adopted from *cpio*; files are interchanged strictly  
 29373 on a symbolic name basis, as in **ustar**.

29374 Just as with the **ustar** format descriptions, the new format makes no special arrangements for  
 29375 multi-volume archives. Each of the *pax* archive types is assumed to be inside a single POSIX file  
 29376 and splitting that file over multiple volumes (diskettes, tape cartridges, and so on), processing  
 29377 their labels, and mounting each in the proper sequence are considered to be implementation  
 29378 details that cannot be described portably.

29379 The *pax* format is intended for interchange, not only for backup on a single (family of) systems. It  
 29380 is not as densely packed as might be possible for backup:

- 29381 • It contains information as coded characters that could be coded in binary.
- 29382 • It identifies extended records with name fields that could be omitted in favor of a fixed-field  
 29383 layout.
- 29384 • It translates names into a portable character set and identifies locale-related information,  
 29385 both of which are probably unnecessary for backup.

29386 The requirements on restoring from an archive are slightly different from the historical wording,  
 29387 allowing for non-monolithic privilege to bring forward as much as possible. In particular,  
 29388 attributes such as “high performance file” might be broadly but not universally granted while  
 29389 set-user-ID or *chown()* might be much more restricted. There is no implication in  
 29390 IEEE Std. 1003.1-200x that the security information be honored after it is restored to the file  
 29391 hierarchy, in spite of what might be improperly inferred by the silence on that topic. That is a  
 29392 topic for another standard.

29393 Links are recorded in the fashion described here because a link can be to any file type. It is  
 29394 desirable in general to be able to restore part of an archive selectively and restore all of those  
 29395 files completely. If the data is not associated with each link, it is not possible to do this.  
 29396 However, the data associated with a file can be large, and when selective restoration is not  
 29397 needed, this can be a significant burden. The archive is structured so that files that have no  
 29398 associated data can always be restored by the name of any link name of any link, and the user  
 29399 may choose whether data is recorded with each instance of a file that contains data. The format  
 29400 permits mixing of both types of links in a single archive; this can be done for special needs, and  
 29401 *pax* is expected to interpret such archives on input properly, despite the fact that there is no *pax*  
 29402 option that would force this mixed case on output. (When **-o linkdata** is used, the output must  
 29403 contain the duplicate data, but the implementation is free to include it or omit it when **-o**  
 29404 **linkdata** is not used.)

29405 The time values are included as extended header records for those implementations needing  
 29406 more than the eleven octal digits allowed by the **ustar** format. Even though some  
 29407 implementations can support finer file-time granularities than seconds, the normative text  
 29408 requires support only for seconds since the Epoch because the ISO POSIX-1 standard states them  
 29409 that way. The **ustar** format includes only *mtime*; the new format adds *atime* and *ctime* for  
 29410 symmetry. The *atime* access time restored to the file system will be affected by the **-p a** and **-p e**  
 29411 options. The *ctime* creation time (actually *inode* modification time) is described with  
 29412 “appropriate privilege” so that it can be ignored when writing to the file system. POSIX does not  
 29413 provide a portable means to change file creation time. Nothing is intended to prevent a non-  
 29414 portable implementation of *pax* from restoring the value.

29415 The *gid*, *size*, and *uid* extended header records were included to allow expansion beyond the  
 29416 sizes specified in the regular *tar* header. New file system architectures are emerging that will  
 29417 exhaust the 12-digit size field. There are probably not many systems requiring more than 8 digits  
 29418 for user and group IDs, but the extended header values were included for completeness,  
 29419 allowing overrides for all of the decimal values in the *tar* header.

29420 The standard developers intended to describe the effective results of *pax* with regard to file  
 29421 ownerships and permissions; implementations are not restricted in timing or sequencing the

29422 restoration of such, provided the results are as specified.

29423 Much of the text describing the extended headers refers to use in “**write** or **copy** modes”. The  
29424 **copy** mode references are due to the normative text: “The effect of the copy shall be as if the  
29425 copied files were written to an archive file and then subsequently extracted ...”. There is  
29426 certainly no way to test whether *pax* is actually generating the extended headers in **copy** mode,  
29427 but the effects must be as if it had.

#### 29428 **pax Archive Character Set Encoding/Decoding**

29429 There is a need to exchange archives of files between systems of different native codesets. File  
29430 names, group names, and user names must be preserved to the fullest extent possible when an  
29431 archive is read on the receiving platform. Translation of the contents of files is not within the  
29432 scope of the *pax* utility.

29433 There will also be the need to represent glyphs that are not available on the receiving platform.  
29434 (A *glyph* is commonly called a character, but without any reference to a specific encoding of that  
29435 character. The term *glyph* refers to the symbol itself.) These unsupported glyphs cannot be  
29436 automatically folded to the local set of glyphs due to the chance of collisions. This could result in  
29437 overwriting previous extracted files from the archive or pre-existing files on the system.

29438 For these reasons, the codeset used to represent glyphs within the extended header records of  
29439 the *pax* archive must be sufficiently rich to handle all commonly used character sets. The fields  
29440 requiring translation include, at a minimum, file names, user names, group names, and link path  
29441 names. Implementations may wish to have localized extended keywords that use non-portable  
29442 characters.

29443 The standard developers considered the following options:

- 29444 • The archive creator specifies the well-defined name of the source codeset. The receiver must  
29445 then recognize the codeset name and perform the appropriate translations to the destination  
29446 codeset.
- 29447 • The archive creator includes within the archive the character mapping table for the source  
29448 codeset used to encode extended header records. The receiver must then read the character  
29449 mapping table and perform the appropriate translations to the destination codeset.
- 29450 • The archive creator translates the extended header records in the source codeset into a  
29451 canonical form. The receiver must then perform the appropriate translations to the  
29452 destination codeset.

29453 The approach that incorporates the name of the source codeset poses the problem of codeset  
29454 name registration, and makes the archive useless to *pax* archive decoders that do not recognize  
29455 that codeset.

29456 Because parts of an archive may be corrupted, the standard developers felt that including the  
29457 character map of the source codeset was too fragile. The loss of this one key component could  
29458 result in making the entire archive useless. (The difference between this and the global extended  
29459 header decision was that the latter has a workaround—duplicating extended header records on  
29460 unreliable media—but this would be too burdensome for large character set maps.)

29461 Both of the above approaches also put an undue burden on the *pax* archive receiver to handle the  
29462 cross-product of all source and destination codesets.

29463 To simplify the translation from the source codeset to the canonical form and from the canonical  
29464 form to the destination codeset, the standard developers decided that the internal representation  
29465 should be a stateless encoding. A stateless encoding is one where each codepoint has the same  
29466 meaning, without regard to the decoder being in a specific state. An example of a stateful

29467 encoding would be the Japanese Shift-JIS; an example of a stateless encoding would be the  
29468 ISO/IEC 646: 1991 standard (equivalent to 7-bit ASCII).

29469 For these reasons, the standard developers decided to adopt a canonical format for the  
29470 representation of file information strings. The obvious, well-endorsed candidate is the  
29471 ISO/IEC 10646-1: 1993 standard (based in part on Unicode), which can be used to represent the  
29472 glyphs of virtually all standardized character sets. The standard developers initially agreed upon  
29473 using UCS2 (16-bit Unicode) as the internal representation. This repertoire of glyphs provides a  
29474 sufficiently rich set to represent all commonly-used codesets.

29475 However, the standard developers found that the 16-bit Unicode representation had some  
29476 problems. It forced the issue of standardizing byte ordering. The 2-byte length of each character  
29477 made the extended header records twice as long for the case of strings coded entirely from  
29478 historical 7-bit ASCII. For these reasons, the standard developers chose the UTF-8 defined in the  
29479 ISO/IEC 10646-1: 1993 standard. This multi-byte representation encodes UCS2 or UCS4  
29480 characters reliably and deterministically, eliminating the need for a canonical byte ordering. In  
29481 addition, NUL octets and other characters possibly confusing to POSIX file systems do not  
29482 appear, except to represent themselves. It was realized that certain national codesets take up  
29483 more space after the encoding, due to their placement within the UCS range; it was felt that the  
29484 usefulness of the encoding of the names outweighs the disadvantage of size increase for file,  
29485 user, and group names.

29486 The encoding of UTF-8 is as follows:

| 29487 | UCS4 Hex Encoding | UTF-8 Binary Encoding                                 |
|-------|-------------------|-------------------------------------------------------|
| 29488 | 00000000-0000007F | 0xxxxxxx                                              |
| 29489 | 00000080-000007FF | 110xxxxx 10xxxxxx                                     |
| 29490 | 00000800-0000FFFF | 1110xxxx 10xxxxxx 10xxxxxx                            |
| 29491 | 00010000-001FFFFF | 11110xxx 10xxxxxx 10xxxxxx 10xxxxxx                   |
| 29492 | 00200000-03FFFFFF | 111110xx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx          |
| 29493 | 04000000-7FFFFFFF | 1111110x 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx |

29494 where each 'x' represents a bit value from the character being translated.

## 29495 **ustar Interchange Format**

29496 The description of the **ustar** format reflects numerous enhancements over pre-1988 versions of  
29497 the historical *tar* utility. The goal of these changes was not only to provide the functional  
29498 enhancements desired, but also to retain compatibility between new and old versions. This  
29499 compatibility has been retained. Archives written using the old archive format are compatible  
29500 with the new format.

29501 Implementors should be aware that the previous file format did not include a mechanism to  
29502 archive directory type files. For this reason, the convention of using a file name ending with  
29503 slash was adopted to specify a directory on the archive.

29504 The total size of the *name* and *prefix* fields have been set to meet the minimum requirements for  
29505 {PATH\_MAX}. If a path name will fit within the *name* field, it is recommended that the path  
29506 name be stored there without the use of the *prefix* field. Although the name field is known to be  
29507 too small to contain {PATH\_MAX} characters, the value was not changed in this version of the  
29508 archive file format to retain backward compatibility, and instead the prefix was introduced.  
29509 Also, because of the earlier version of the format, there is no way to remove the restriction on the  
29510 *linkname* field being limited in size to just that of the *name* field.

29511 The *size* field is required to be meaningful in all implementation extensions, although it could be  
29512 zero. This is required so that the data blocks can always be properly counted.

29513 It is suggested that if device special files need to be represented that cannot be represented in the  
 29514 standard format that one of the extension types (A-Z) be used, and that the additional  
 29515 information for the special file be represented as data and be reflected in the *size* field.

29516 Attempting to restore a special file type, where it is converted to ordinary data and conflicts  
 29517 with an existing file name, need not be specially detected by the utility. If run as an ordinary  
 29518 user, *pax* should not be able to overwrite the entries in, for example, */dev* in any case (whether  
 29519 the file is converted to another type or not). If run as a privileged user, it should be able to do so,  
 29520 and it would be considered a bug if it did not. The same is true of ordinary data files and  
 29521 similarly named special files; it is impossible to anticipate the needs of the user (who could  
 29522 really intend to overwrite the file), so the behavior should be predictable (and thus regular) and  
 29523 rely on the protection system as required.

29524 The value 7 in the *typeflag* field is intended to define how contiguous files can be stored in a  
 29525 **ustar** archive. IEEE Std. 1003.1-200x does not require the contiguous file extension, but does  
 29526 define a standard way of archiving such files so that all conforming systems can interpret these  
 29527 file types in a meaningful and consistent manner. On a system that does not support extended  
 29528 file types, the *pax* utility should do the best it can with the file and go on to the next.

29529 The file protection modes are those conventionally used by the *ls* utility. This is extended  
 29530 beyond the usage in the ISO POSIX-2 standard to support the “shared text” or “sticky” bit. It is  
 29531 intended that the conformance document should not document anything beyond the existence  
 29532 of and support of such a mode. Further extensions are expected to these bits, particularly with  
 29533 overloading the set-user-ID and set-group-ID flags.

#### 29534 **cpio Interchange Format**

29535 The reference to appropriate privilege in the *cpio* format refers to an error on standard output;  
 29536 the **ustar** format does not make comparable statements.

29537 The model for this format was the historical System V *cpio-c* data interchange format. This  
 29538 model documents the portable version of the *cpio* format and not the binary version. It has the  
 29539 flexibility to transfer data of any type described within IEEE Std. 1003.1-200x, yet is extensible to  
 29540 transfer data types specific to extensions beyond IEEE Std. 1003.1-200x (for example, contiguous  
 29541 files). Because it describes existing practice, there is no question of maintaining upward  
 29542 compatibility.

#### 29543 **cpio Header**

29544 There has been some concern that the size of the *c\_ino* field of the header is too small to handle  
 29545 those systems that have very large *inode* numbers. However, the *c\_ino* field in the header is used  
 29546 strictly as a hard-link resolution mechanism for archives. It is not necessarily the same value as  
 29547 the *inode* number of the file in the location from which that file is extracted.

29548 The name *c\_magic* is based on historical usage.

#### 29549 **cpio File Name**

29550 For most historical implementations of the *cpio* utility, {PATH\_MAX} octets can be used to  
 29551 describe the path name without the addition of any other header fields (the NUL character  
 29552 would be included in this count). {PATH\_MAX} is the minimum value for path name size,  
 29553 documented as 256 bytes. However, an implementation may use *c\_namesize* to determine the  
 29554 exact length of the path name. With the current description of the **<cpio.h>** header, this path  
 29555 name size can be as large as a number that is described in six octal digits.

29556 Two values are documented under the *c\_mode* field values to provide for extensibility for known  
 29557 file types:

29558 **Notes to Reviewers**29559 *This section with side shading will not appear in the final copy. - Ed.*

29560 Note that the sockets extension below needs to be integrated, now that sockets have been  
 29561 merged

29562 **0110 000** Reserved for contiguous files. The implementation may treat the rest of the  
 29563 information for this archive like a regular file. If this file type is undefined, the  
 29564 implementation may create the file as a regular file.

29565 **0140 000** Reserved for sockets. If this type is undefined on the target system, the  
 29566 implementation may decide to ignore this file type and output a warning message.

29567 This provides for extensibility of the *cpio* format while allowing for the ability to read old  
 29568 archives. Files of an unknown type may be read as “regular files” on some implementations. On  
 29569 a system that does not support extended file types, the *pax* utility should do the best it can with  
 29570 the file and go on to the next.

29571 **FUTURE DIRECTIONS**

29572 None.

29573 **SEE ALSO**

29574 *cp*, *ed*, *getopts*, *printf*, the System Interface Definitions volume of IEEE Std. 1003.1-200x, *<cpio.h>*,  
 29575 the System Interfaces volume of IEEE Std. 1003.1-200x, *chown()*, *creat()*, *mkdir()*, *stat()*, *write()*

29576 **CHANGE HISTORY**

29577 First released in Issue 4.

29578 **Issue 5**

29579 A note is added to the APPLICATION USAGE indicating that the *cpio* and *tar* formats can only  
 29580 support files up to 8 gigabytes in size.

29581 **Issue 6**29582 The *pax* utility is aligned with the IEEE P1003.2b draft standard:

- 29583 • Support has been added for symbolic links in the options and interchange formats.
- 29584 • A new format has been devised, based on extensions to *ustar*.
- 29585 • References to the “extended” *tar* and *cpio* formats derived from the POSIX.1-1990 standard
- 29586 have been changed to remove the “extended” adjective because this could cause confusion
- 29587 with the extended *tar* header added in this revision. (All references to *tar* are actually to
- 29588 **ustar**).

## 29589 NAME

29590 pr — print files

## 29591 SYNOPSIS

```
29592 pr [+page][-column][-adFmrt][-e[char][gap]][-h header][-i[char][gap]]
29593 xsi [-l lines][-n[char][width]][-o offset][-s[char]][-w width][-fp]
29594 [file...]
```

## 29595 DESCRIPTION

29596 The *pr* utility is a printing and pagination filter. If multiple input files are specified, each shall be  
 29597 read, formatted, and written to standard output. By default, the input shall be separated into 66-  
 29598 line pages, each with:

- 29599 • A 5-line header that includes the page number, date, time, and the path name of the file
- 29600 • A 5-line trailer consisting of blank lines

29601 If standard output is associated with a terminal, diagnostic messages shall be deferred until the  
 29602 *pr* utility has completed processing.

29603 When options specifying multi-column output are specified, output text columns shall be of  
 29604 equal width; input lines that do not fit into a text column shall be truncated. By default, text  
 29605 columns shall be separated with at least one <blank> character.

## 29606 OPTIONS

29607 The *pr* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 29608 Section 12.2, Utility Syntax Guidelines, except that: the *page* option has a '+' delimiter; *page* and  
 29609 *column* can be multi-digit numbers; some of the option-arguments are optional; and some of the  
 29610 option-arguments cannot be specified as separate arguments from the preceding option letter. In  
 29611 particular, the *-s* option does not allow the option letter to be separated from its argument, and  
 29612 the options *-e*, *-i*, and *-n* require that both arguments, if present, not be separated from the  
 29613 option letter.

29614 The following options shall be supported. In the following option descriptions, *column*, *lines*,  
 29615 *offset*, *page*, and *width* are positive decimal integers; *gap* is a non-negative decimal integer.

29616 *+page* Begin output at page number *page* of the formatted input.

29617 *-column* Produce multi-column output that is arranged in *column* columns (the default shall  
 29618 be 1) and is written down each column in the order in which the text is received  
 29619 from the input file. This option should not be used with *-m*. The options *-e* and *-i*  
 29620 shall be assumed for multiple text-column output. Whether or not text columns  
 29621 are produced with identical vertical lengths is unspecified, but a text column shall  
 29622 never exceed the length of the page (see the *-l* option). When used with *-t*, use the  
 29623 minimum number of lines to write the output.

29624 *-a* Modify the effect of the *-column* option so that the columns are filled across the  
 29625 page in a round-robin order (for example, when *column* is 2, the first input line  
 29626 heads column 1, the second heads column 2, the third is the second line in column  
 29627 1, and so on).

29628 *-d* Produce output that is double-spaced; append an extra <newline> character  
 29629 following every <newline> character found in the input.

29630 *-e[*char*][*gap*]*

29631 Expand each input <tab> character to the next greater column position specified  
 29632 by the formula  $n * \text{gap} + 1$ , where *n* is an integer > 0. If *gap* is zero or is omitted, it  
 29633 shall default to 8. All <tab> characters in the input shall be expanded into the  
 29634 appropriate number of <space> characters. If any non-digit character, *char*, is

|           |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 29635     |                        | specified, it shall be used as the input <tab> character.                                                                                                                                                                                                                                                                                                                                                                      |

| 29670     | <b>-t</b>              | Write neither the five-line identifying header nor the five-line trailer usually supplied for each page. Quit writing after the last line of each file without spacing to the end of the page.                                                                                                                                                                                                                                 |
| 29671     |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 29672     |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 29673     | <b>-w width</b>        | Set the width of the line to <i>width</i> column positions for multiple text-column output only. If the <b>-w</b> option is not specified and the <b>-s</b> option is not specified, the default width shall be 72. If the <b>-w</b> option is not specified and the <b>-s</b> option is specified, the default width shall be 512.                                                                                            |
| 29674     |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 29675     |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 29676     |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 29677     |                        | For single column output, input lines shall not be truncated.                                                                                                                                                                                                                                                                                                                                                                  |

29678 **OPERANDS**

29679 The following operand shall be supported:

29680 *file* A path name of a file to be written. If no *file* operands are specified, or if a *file*  
 29681 operand is '-', the standard input shall be used.

29682 **STDIN**

29683 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 29684 See the INPUT FILES section.

29685 **INPUT FILES**

29686 The input files shall be text files.

29687 The file */dev/tty* is used to read responses required by the **-p** option.

29688 **ENVIRONMENT VARIABLES**

29689 The following environment variables shall affect the execution of *pr*:

29690 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 29691 If *LANG* is unset or null, the corresponding value from the implementation-  
 29692 dependent default locale shall be used. If any of the internationalization variables  
 29693 contains an invalid setting, the utility shall behave as if none of the variables had  
 29694 been defined.

29695 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 29696 internationalization variables.

29697 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 29698 characters (for example, single-byte as opposed to multi-byte characters in  
 29699 arguments and input files) and which characters are defined as printable (character  
 29700 class **print**). Non-printable characters are still written to standard output, but are  
 29701 not counted for the purpose for column-width and line-length calculations.

29702 *LC\_MESSAGES*

29703 Determine the locale that should be used to affect the format and contents of  
 29704 diagnostic messages written to standard error.

29705 *LC\_TIME* Determine the format of the date and time for use in writing header lines.

29706 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

29707 *TZ* Determine the timezone for use in writing header lines.

29708 **ASYNCHRONOUS EVENTS**

29709 If *pr* receives an interrupt while writing to a terminal, it shall flush all accumulated error  
 29710 messages to the screen before terminating.

29711 **STDOUT**

29712 The *pr* utility output shall be a paginated version of the original file (or files). This pagination  
 29713 shall be accomplished using either <form-feed> characters or a sequence of <newline>  
 29714 XSI characters, as controlled by the **-F** or **-f** option. Page headers shall be generated unless the **-t**  
 29715 option is specified. The page headers shall be of the form:

29716 "\n\n%s %s Page %d\n\n\n", <output of date>, <file>, <page number>

29717 In the POSIX locale, the <output of date> field, representing the date and time of last modification  
 29718 of the input file (or the current date and time if the input file is standard input), shall be  
 29719 equivalent to the output of the following command as it would appear if executed at the given  
 29720 time:

29721 date "+%b %e %H:%M %Y"

29722 without the trailing <newline> character, if the page being written is from standard input. If the  
 29723 page being written is not from standard input, in the POSIX locale, the same format shall be  
 29724 used, but the time used shall be the modification time of the file corresponding to *file* instead of  
 29725 the current time. When the *LC\_TIME* locale category is not set to the POSIX locale, a different  
 29726 format and order of presentation of this field may be used.

29727 If the standard input is used instead of a *file* operand, the <*file*> field shall be replaced by a null  
 29728 string.

29729 If the **-h** option is specified, the <*file*> field shall be replaced by the *header* argument.

## 29730 STDERR

29731 MAN Used for diagnostic messages and for alerting the terminal when **-p** is specified.

## 29732 OUTPUT FILES

29733 None.

## 29734 EXTENDED DESCRIPTION

29735 None.

## 29736 EXIT STATUS

29737 The following exit values shall be returned:

29738 0 Successful completion.

29739 >0 An error occurred.

## 29740 CONSEQUENCES OF ERRORS

29741 Default.

## 29742 APPLICATION USAGE

29743 None.

## 29744 EXAMPLES

29745 1. Print a numbered list of all files in the current directory:

29746 `ls -a | pr -n -h "Files in $(pwd)."`

29747 2. Print **file1** and **file2** as a double-spaced, three-column listing headed by “file list”:

29748 `pr -3d -h "file list" file1 file2`

29749 3. Write **file1** on **file2**, expanding tabs to columns 10, 19, 28, ...:

29750 `pr -e9 -t <file1 >file2`

## 29751 RATIONALE

29752 This utility is one of those that does not follow the Utility Syntax Guidelines because of its  
 29753 historical origins. The standard developers could have added new options that obeyed the  
 29754 guidelines (and marked the old options *obsolescent*) or devised an entirely new utility; there are  
 29755 examples of both actions in this volume of IEEE Std. 1003.1-200x. Because of its widespread use  
 29756 by historical applications, the standard developers decided to exempt this version of *pr* from  
 29757 many of the guidelines.

29758 Implementations are required to accept option-arguments to the **-h**, **-l**, **-o**, and **-w** options  
 29759 whether presented as part of the same argument or as a separate argument to *pr*, as suggested by  
 29760 the Utility Syntax Guidelines. The **-n** and **-s** options, however, are specified as in historical  
 29761 practice because they are frequently specified without their optional arguments. If a <blank>  
 29762 were allowed before the option-argument in these cases, a file operand could mistakenly be

- 29763 interpreted as an option-argument in historical applications.
- 29764 The text about the minimum number of lines in multi-column output was included to ensure  
 29765 that a best effort is made in balancing the length of the columns. There are known historical  
 29766 implementations in which, for example, 60-line files are listed by *pr -2* as one column of 56 lines  
 29767 and a second of 4. Although this is not a problem when a full page with headers and trailers is  
 29768 produced, it would be relatively useless when used with *-t*.
- 29769 Historical implementations of the *pr* utility have differed in the action taken for the *-f* option.  
 29770 BSD uses it as described here for the *-F* option; System V uses it to change trailing <newline>s  
 29771 on each page to a <form-feed> and, if standard output is a TTY device, sends an <alert> to  
 29772 standard error and reads a line from */dev/tty* before the first page. There were strong arguments  
 29773 from both sides of this issue concerning historical practice and additional arguments against the  
 29774 System V *-f* behavior, on the grounds that having the behavior of an option change depending  
 29775 on where output is directed was not a modular design. Therefore, the *-f* option is not specified  
 29776 and the *-F* option has been added.
- 29777 The <output of date> field in the *-l* format is specified only for the POSIX locale. As noted, the  
 29778 format can be different in other locales. No mechanism for defining this is present in this volume  
 29779 of IEEE Std. 1003.1-200x, as the appropriate vehicle is a messaging system; that is, the format  
 29780 should be specified as a “message”.
- 29781 **FUTURE DIRECTIONS**
- 29782 It is possible that a new interface that conforms to the Utility Syntax Guidelines will be  
 29783 introduced.
- 29784 **SEE ALSO**
- 29785 *expand, lp*
- 29786 **CHANGE HISTORY**
- 29787 First released in Issue 2.
- 29788 **Issue 4**
- 29789 Aligned with the ISO/IEC 9945-2: 1993 standard.
- 29790 **Issue 6**
- 29791 The following new requirements on POSIX implementations derive from alignment with the  
 29792 Single UNIX Specification:
- 29793 • The *-p* option is added.
- 29794 The normative text is reworded to avoid use of the term “must” for application requirements.

29795 **NAME**

29796       printf — write formatted output

29797 **SYNOPSIS**29798       printf *format*[*argument...*]29799 **DESCRIPTION**

29800       The *printf* utility shall write formatted operands to the standard output. The *argument* operands  
 29801       shall be formatted under control of the *format* operand.

29802 **OPTIONS**

29803       None.

29804 **OPERANDS**

29805       The following operands shall be supported:

29806       *format*       A string describing the format to use to write the remaining operands. See the  
 29807       EXTENDED DESCRIPTION section.

29808       *argument*    The strings to be written to standard output, under the control of *format*. See the  
 29809       EXTENDED DESCRIPTION section.

29810 **STDIN**

29811       Not used.

29812 **INPUT FILES**

29813       None.

29814 **ENVIRONMENT VARIABLES**29815       The following environment variables shall affect the execution of *printf*:

29816       *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 29817       If *LANG* is unset or null, the corresponding value from the implementation-  
 29818       dependent default locale shall be used. If any of the internationalization variables  
 29819       contains an invalid setting, the utility shall behave as if none of the variables had  
 29820       been defined.

29821       *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 29822       internationalization variables.

29823       *LC\_CTYPE*    Determine the locale for the interpretation of sequences of bytes of text data as  
 29824       characters (for example, single-byte as opposed to multi-byte characters in  
 29825       arguments).

29826       *LC\_MESSAGES*  
 29827       Determine the locale that should be used to affect the format and contents of  
 29828       diagnostic messages written to standard error.

29829       *LC\_NUMERIC*  
 29830       Determine the locale for numeric formatting. It shall affect the format of numbers  
 29831       written using the *e*, *E*, *f*, *g*, and *G* conversion characters (if supported).

29832 **XSI**       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

29833 **ASYNCHRONOUS EVENTS**

29834       Default.

29835 **STDOUT**

29836 See the EXTENDED DESCRIPTION section.

29837 **STDERR**

29838 Used only for diagnostic messages.

29839 **OUTPUT FILES**

29840 None.

29841 **EXTENDED DESCRIPTION**

29842 The *format* operand shall be used as the *format* string described in the System Interface  
 29843 Definitions volume of IEEE Std. 1003.1-200x, Chapter 5, File Format Notation with the following  
 29844 exceptions:

- 29845 1. A <space> character in the format string, in any context other than a flag of a conversion  
 29846 specification, shall be treated as an ordinary character that is copied to the output.
- 29847 2. A 'Δ' character in the format string shall be treated as a 'Δ' character, not as a <space>  
 29848 character.
- 29849 3. In addition to the escape sequences shown in the System Interface Definitions volume of  
 29850 IEEE Std. 1003.1-200x, Chapter 5, File Format Notation ('\\', '\a', '\b', '\f', '\n',  
 29851 '\r', '\t', '\v'), "\ddd", where *ddd* is a one, two, or three-digit octal number, shall be  
 29852 written as a byte with the numeric value specified by the octal number.
- 29853 4. The implementation shall not precede or follow output from the *d* or *u* conversion  
 29854 specifications with <blank> characters not specified by the *format* operand.
- 29855 5. The implementation shall not precede output from the *o* conversion specification with  
 29856 zeros not specified by the *format* operand.
- 29857 6. The *e*, *E*, *f*, *g*, and *G* conversion specifications need not be supported.
- 29858 7. An additional conversion character, *b*, shall be supported as follows. The argument shall  
 29859 be taken to be a string that may contain backslash-escape sequences. The following  
 29860 backslash-escape sequences shall be supported:
  - 29861 — The escape sequences listed in the System Interface Definitions volume of  
 29862 IEEE Std. 1003.1-200x, Chapter 5, File Format Notation ('\\', '\a', '\b', '\f',  
 29863 '\n', '\r', '\t', '\v'), which shall be converted to the characters they represent
  - 29864 — "\ddd", where *ddd* is a zero, one, two, or three-digit octal number that shall be  
 29865 converted to a byte with the numeric value specified by the octal number
  - 29866 — '\c', which shall not be written and shall cause *printf* to ignore any remaining  
 29867 characters in the string operand containing it, any remaining string operands, and any  
 29868 additional characters in the *format* operand
- 29869 The interpretation of a backslash followed by any other sequence of characters is  
 29870 unspecified.
- 29871 Bytes from the converted string shall be written until the end of the string or the number of  
 29872 bytes indicated by the precision specification is reached. If the precision is omitted, it shall  
 29873 be taken to be infinite, so all bytes up to the end of the converted string shall be written.
- 29874 8. For each specification that consumes an argument, the next argument operand shall be  
 29875 evaluated and converted to the appropriate type for the conversion as specified below.
- 29876 9. The *format* operand shall be reused as often as necessary to satisfy the argument operands.  
 29877 Any extra *c* or *s* conversion specifications shall be evaluated as if a null string argument  
 29878 were supplied; other extra conversion specifications shall be evaluated as if a zero

29879 argument were supplied. If the *format* operand contains no conversion specifications and  
 29880 *argument* operands are present, the results are unspecified.

29881 10. If a character sequence in the *format* operand begins with a '%' character, but does not  
 29882 form a valid conversion specification, the behavior is unspecified.

29883 The *argument* operands shall be treated as strings if the corresponding conversion character is *b*,  
 29884 *c*, or *s*; otherwise, it shall be evaluated as a C constant, as described by the ISO C standard, with  
 29885 the following extensions:

- 29886 • A leading plus or minus sign shall be allowed.
- 29887 • If the leading character is a single-quote or double-quote, the value shall be the numeric  
 29888 value in the underlying codeset of the character following the single-quote or double-quote.

29889 If an argument operand cannot be completely converted into an internal value appropriate to  
 29890 the corresponding conversion specification, a diagnostic message shall be written to standard  
 29891 error and the utility shall not exit with a zero exit status, but shall continue processing any  
 29892 remaining operands and shall write the value accumulated at the time the error was detected to  
 29893 standard output.

#### 29894 EXIT STATUS

29895 The following exit values shall be returned:

29896 0 Successful completion.

29897 >0 An error occurred.

#### 29898 CONSEQUENCES OF ERRORS

29899 Default.

#### 29900 APPLICATION USAGE

29901 The floating-point formatting conversion specifications of *printf()* are not required because all  
 29902 arithmetic in the shell is integer arithmetic. The *awk* utility performs floating-point calculations  
 29903 and provides its own **printf** function. The *bc* utility can perform arbitrary-precision floating-  
 29904 point arithmetic, but does not provide extensive formatting capabilities. (This *printf* utility  
 29905 cannot really be used to format *bc* output; it does not support arbitrary precision.)  
 29906 Implementations are encouraged to support the floating-point conversions as an extension.

29907 Note that this *printf* utility, like the *printf()* function defined in the System Interfaces volume of  
 29908 IEEE Std. 1003.1-200x on which it is based, makes no special provision for dealing with multi-  
 29909 byte characters when using the *%c* conversion specification or when a precision is specified in a  
 29910 *%b* or *%s* conversion specification. Applications should be extremely cautious using either of  
 29911 these features when there are multi-byte characters in the character set.

29912 No provision is made in this volume of IEEE Std. 1003.1-200x which allows field widths and  
 29913 precisions to be specified as '\*' since the '\*' can be replaced directly in the *format* operand  
 29914 using shell variable substitution. Implementations can also provide this feature as an extension  
 29915 if they so choose.

29916 Hexadecimal character constants as defined in the ISO C standard are not recognized in the  
 29917 *format* operand because there is no consistent way to detect the end of the constant. Octal  
 29918 character constants are limited to, at most, three octal digits, but hexadecimal character  
 29919 constants are only terminated by a non-hex-digit character. In the ISO C standard, the "##"  
 29920 concatenation operator can be used to terminate a constant and follow it with a hexadecimal  
 29921 character to be written. In the shell, concatenation occurs before the *printf* utility has a chance to  
 29922 parse the end of the hexadecimal constant.

29923 The `%b` conversion specification is not part of the ISO C standard; it has been added here as a  
 29924 portable way to process backslash escapes expanded in string operands as provided by the *echo*  
 29925 utility. See also the APPLICATION USAGE section of *echo* on page 366 for ways to use *printf* as a  
 29926 replacement for all of the traditional versions of the *echo* utility.

29927 If an argument cannot be parsed correctly for the corresponding conversion specification, the  
 29928 *printf* utility is required to report an error. Thus, overflow and extraneous characters at the end  
 29929 of an argument being used for a numeric conversion shall be reported as errors.

## 29930 **Notes to Reviewers**

29931 *This section with side shading will not appear in the final copy. - Ed.*

29932 Is the following text normative? If so, where should it be moved to?

29933 It is not considered an error if an argument operand is not completely used for a `c` or `s`  
 29934 conversion or if a string operand's first or second character is used to get the numeric value of a  
 29935 character.

## 29936 **EXAMPLES**

29937 To alert the user and then print and read a series of prompts:

```
29938 printf "\aPlease fill in the following: \nName: "
29939 read name
29940 printf "Phone number: "
29941 read phone
```

29942 To read out a list of right and wrong answers from a file, calculate the percentage correctly, and  
 29943 print them out. The numbers are right-justified and separated by a single <tab> character. The  
 29944 percentage is written to one decimal place of accuracy:

```
29945 while read right wrong ; do
29946 percent=$(echo "scale=1;($right*100)/($right+$wrong)" | bc)
29947 printf "%2d right\t%2d wrong\t(%%s%%)\n" \
29948 $right $wrong $percent
29949 done < database_file
```

29950 The command:

```
29951 printf "%5d%4d\n" 1 21 321 4321 54321
```

29952 produces:

```
29953 1 21
29954 3214321
29955 54321 0
```

29956 Note that the *format* operand is used three times to print all of the given strings and that a `'0'`  
 29957 was supplied by *printf* to satisfy the last `%4d` conversion specification.

29958 The *printf* utility is required to notify the user when conversion errors are detected while  
 29959 producing numeric output; thus, the following results would be expected on an implementation  
 29960 with 32-bit twos-complement integers when `%d` is specified as the *format* operand:

29961  
29962  
29963  
29964  
29965  
29966  
29967

| Argument    | Standard Output | Diagnostic Output                         |
|-------------|-----------------|-------------------------------------------|
| 5a          | 5               | printf: "5a" not completely converted     |
| 9999999999  | 2147483647      | printf: "9999999999" arithmetic overflow  |
| -9999999999 | -2147483648     | printf: "-9999999999" arithmetic overflow |
| ABC         | 0               | printf: "ABC" expected numeric value      |

29968  
29969  
29970  
29971  
29972  
29973

The diagnostic message format is not specified, but these examples convey the type of information that should be reported. Note that the value shown on standard output is what would be expected as the return value from the *strtol()* function as defined in the System Interfaces volume of IEEE Std. 1003.1-200x. A similar correspondence exists between *%u* and *strtoul()* and *%e*, *%f*, and *%g* (if the implementation supports floating-point conversions) and *strtod()*.

29974

In a locale using the ISO/IEC 646: 1991 standard as the underlying codeset, the command:

29975

```
printf "%d\n" 3 +3 -3 \'3 \"+3 "'-3"
```

29976

produces:

29977

3    Numeric value of constant 3

29978

3    Numeric value of constant 3

29979

-3   Numeric value of constant -3

29980

51   Numeric value of the character '3' in the ISO/IEC 646: 1991 standard codeset

29981

43   Numeric value of the character '+' in the ISO/IEC 646: 1991 standard codeset

29982

45   Numeric value of the character '-' in the ISO/IEC 646: 1991 standard codeset

29983

Note that in a locale with multi-byte characters, the value of a character is intended to be the value of the equivalent of the **wchar\_t** representation of the character as described in the System Interfaces volume of IEEE Std. 1003.1-200x.

29984

29985

#### 29986 RATIONALE

29987

The *printf* utility was added to provide functionality that has historically been provided by *echo*.

29988

However, due to irreconcilable differences in the various versions of *echo* extant, the version has few special features, leaving those to this new *printf* utility, which is based on one in the Ninth Edition system.

29989

29990

29991

The EXTENDED DESCRIPTION section almost exactly matches the *printf()* function in the ISO C standard, although it is described in terms of the file format notation in the System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 5, File Format Notation.

29992

29993

#### 29994 FUTURE DIRECTIONS

29995

None.

#### 29996 SEE ALSO

29997

*awk*, *bc*, *echo*, the System Interfaces volume of IEEE Std. 1003.1-200x, *printf()*

#### 29998 CHANGE HISTORY

29999

First released in Issue 4.

## 30000 NAME

30001        *prs* — print an SCCS file (**DEVELOPMENT**)

## 30002 SYNOPSIS

30003 XSI        *prs* [-a][-d *dataspec*][-r[*SID*]] *file...*

30004 XSI        *prs* [ -e | -l ] -c *cutoff* [-d *dataspec*] *file...*

30005 XSI        *prs* [ -e | -l ] -r[*SID*][-d *dataspec*]*file...*

30006

## 30007 DESCRIPTION

30008        The *prs* utility shall write to standard output parts or all of an SCCS file in a user-supplied  
30009        format.

## 30010 OPTIONS

30011        The *prs* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
30012        Section 12.2, Utility Syntax Guidelines, except that the **-r** option has an optional option-  
30013        argument. This optional option-argument cannot be presented as a separate argument. The  
30014        following options shall be supported:

30015        **-d *dataspec***    Specify the output data specification. The *dataspec* is a string consisting of SCCS  
30016        file *data keywords* (see **Data Keywords** on page 783) interspersed with optional  
30017        user-supplied text.

30018        **-r[*SID*]**        Specify the SCCS identification string (*SID*) of a delta for which information is  
30019        desired. If no *SID* option-argument is specified, the *SID* of the most recently  
30020        created delta is assumed.

30021        **-e**                Request information for all deltas created earlier than and including the delta  
30022        designated via the **-r** option or the date-time given by the **-c** option.

30023        **-l**                Request information for all deltas created later than and including the delta  
30024        designated via the **-r** option or the date-time given by the **-c** option.

30025        **-c *cutoff***        Indicate the *cutoff* date-time, in the form:

30026                *YY*[*MM* [*DD* [*HH* [*MM* [*SS*] ] ] ] ]

30027                For the *YY* component, values in the range [69-99] shall refer to years in the  
30028                twentieth century (1969 to 1999 inclusive); values in the range [00-68] shall refer to  
30029                years in the twenty-first century (2000 to 2068 inclusive).

30030                No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
30031                date-time shall be included in the output. Units omitted from the date-time default  
30032                to their maximum possible values; for example, **-c 7502** is equivalent to  
30033                **-c 750228235959**.

30034        **-a**                Request writing of information for both removed, that is, *delta type*=*R* (see *rm del* on  
30035        page 865) and existing, that is, *delta type*=*D*, deltas. If the **-a** option is not specified,  
30036        information for existing deltas only shall be provided.

## 30037 OPERANDS

30038        The following operand shall be supported:

30039        *file*            A path name of an existing SCCS file or a directory. If *file* is a directory, *prs* behaves  
30040        as though each file in the directory were specified as a named file, except that  
30041        non-SCCS files (last component of the path name does not begin with **s**.) and  
30042        unreadable files are silently ignored.

30043 If a single instance *file* is specified as *'-'*, the standard input shall be read; each  
 30044 line of the standard input shall be taken to be the name of an SCCS file to be  
 30045 processed. Non-SCCS files and unreadable files are silently ignored.

#### 30046 **STDIN**

30047 The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 30048 line of the text file shall be interpreted as an SCCS path name.

#### 30049 **INPUT FILES**

30050 Any SCCS files displayed are files of an unspecified format.

#### 30051 **ENVIRONMENT VARIABLES**

30052 The following environment variables shall affect the execution of *prs*:

30053 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 30054 If *LANG* is unset or null, the corresponding value from the implementation-  
 30055 dependent default locale shall be used. If any of the internationalization variables  
 30056 contains an invalid setting, the utility shall behave as if none of the variables had  
 30057 been defined.

30058 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 30059 internationalization variables.

30060 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 30061 characters (for example, single-byte as opposed to multi-byte characters in  
 30062 arguments and input files).

#### 30063 *LC\_MESSAGES*

30064 Determine the locale that should be used to affect the format and contents of  
 30065 diagnostic messages written to standard error.

30066 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 30067 **ASYNCHRONOUS EVENTS**

30068 Default.

#### 30069 **STDOUT**

30070 The standard output shall be a text file whose format is dependent on the data keywords  
 30071 specified with the *-d* option.

#### 30072 **Data Keywords**

30073 Data keywords specify which parts of an SCCS file shall be retrieved and output. All parts of an  
 30074 SCCS file have an associated data keyword. A data keyword may appear in a *dataspec* multiple  
 30075 times.

30076 The information written by *prs* consists of:

- 30077 1. The user-supplied text
- 30078 2. Appropriate values (extracted from the SCCS file) substituted for the recognized data  
 30079 keywords in the order of appearance in the *dataspec*

30080 The format of a data keyword value is either simple (*'S'*), in which keyword substitution is  
 30081 direct, or multi-line (*'M'*).

30082 User-supplied text is any text other than recognized data keywords. A <tab> character is  
 30083 specified by *'\t'* and <newline> by *'\n'*. When the *-r* option is not specified, the default  
 30084 *dataspec* is:

30085 :PN::\n\n

30086 and the following *dataspec* is used for each selected delta:

30087 :Dt:\t:DL:\nMRs:\n:MR:COMMENTS:\n:C:\n

30150

**:R::L:** if the delta is not a branch delta (**:BF:= =no**)**30151 STDERR**

30152 Used only for diagnostic messages.

**30153 OUTPUT FILES**

30154 None.

**30155 EXTENDED DESCRIPTION**

30156 None.

**30157 EXIT STATUS**

30158 The following exit values shall be returned:

30159 0 Successful completion.

30160 &gt;0 An error occurred.

**30161 CONSEQUENCES OF ERRORS**

30162 Default.

**30163 APPLICATION USAGE**

30164 None.

**30165 EXAMPLES**

30166 1. The following example:

30167 prs -d "User Names for :F: are:\n:UN:" s.file

30168 may write to standard output:

30169 User Names for s.file are:

30170 xyz

30171 131

30172 abc

30173 2. The following example:

30174 prs -d "Delta for pgm :M:: :I: - :D: By :P:" -r s.file

30175 may write to standard output:  
 30176 Delta for pgm main.c: 3.7 – 77/12/01 By cas  
 30177 3. As a special case:  
 30178 prs s.file  
 30179 may write to standard output:  
 30180 s.file:  
 30181 <blank line>  
 30182 D 1.1 77/12/01 00:00:00 cas 1 000000/00000/00000  
 30183 MRs:  
 30184 b178–12345  
 30185 b179–54321  
 30186 COMMENTS:  
 30187 this is the comment line for s.file initial delta  
 30188 <blank line>  
 30189 for each delta table entry of the **D** type. The only option allowed to be used with this  
 30190 special case is the **–a** option.  
 30191 **RATIONALE**  
 30192 None.  
 30193 **FUTURE DIRECTIONS**  
 30194 A version of *prs* that fully supports the System Interface Definitions volume of  
 30195 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines may be introduced in a future  
 30196 issue.  
 30197 **SEE ALSO**  
 30198 *admin, delta, get, what*  
 30199 **CHANGE HISTORY**  
 30200 First released in Issue 2.  
 30201 **Issue 4**  
 30202 Format reorganized.  
 30203 Exceptions to Utility Syntax Guidelines conformance noted.  
 30204 Internationalized environment variable support mandated.  
 30205 **Issue 5**  
 30206 The phrase “in which keyword substitution is followed by a <newline>” is deleted from the end  
 30207 of the second paragraph of **Data Keywords** on page 783.  
 30208 The interpretation of the YY component of the **–c cutoff** argument is noted.

30209 **NAME**30210 `ps` — report process status30211 **SYNOPSIS**30212 UP XSI `ps [-aA][--defl][--G grouplist][--o format]...[-p proclist][-t termlist]`30213 `[-U userlist][--g grouplist][--n namelist][--u userlist]`

30214

30215 **DESCRIPTION**30216 The `ps` utility shall write information about processes, subject to having the appropriate  
30217 privileges to obtain information about those processes.30218 By default, `ps` selects all processes with the same effective user ID as the current user and the  
30219 same controlling terminal as the invoker.30220 **OPTIONS**30221 The `ps` utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
30222 Section 12.2, Utility Syntax Guidelines.

30223 The following options shall be supported:

30224 **-a** Write information for all processes associated with terminals. Implementations  
30225 may omit session leaders from this list.30226 **-A** Write information for all processes.30227 XSI **-d** Write information for all processes, except session leaders.30228 XSI **-e** Write information for all processes. (Equivalent to **-A**.)30229 XSI **-f** Generate a **full** listing. (See the STDOUT section for the contents of a **full** listing.)30230 XSI **-g grouplist** Write information for processes whose session leaders are given in *grouplist*. The  
30231 application shall ensure that the *grouplist* is a single argument in the form of a  
30232 <blank> or comma-separated list.30233 **-G grouplist** Write information for processes whose real group ID numbers are given in  
30234 *grouplist*. The application shall ensure that the *grouplist* is a single argument in the  
30235 form of a <blank> or comma-separated list.30236 XSI **-l** Generate a **long** listing. (See the STDOUT section for the contents of a **long** listing.)

30237

30238 XSI **-n namelist** Specify the name of an alternative system *namelist* file in place of the default. The  
30239 name of the default file and the format of a *namelist* file are unspecified.30240 **-o format** Write information according to the format specification given in *format*. This is  
30241 fully described in the STDOUT section. Multiple **-o** options can be specified; the  
30242 format specification shall be interpreted as the <space> character-separated  
30243 concatenation of all the *format* option-arguments.30244 **-p proclist** Write information for processes whose process ID numbers are given in *proclist*.  
30245 The application shall ensure that the *proclist* is a single argument in the form of a  
30246 <blank> or comma-separated list.30247 **-t termlist** Write information for processes associated with terminals given in *termlist*. The  
30248 application shall ensure that the *termlist* is a single argument in the form of a  
30249 XSI <blank> or comma-separated list. Terminal identifiers shall be given in one of two  
30250 forms: the device's file name (for example, **tty04**) or, if the device's file name starts  
30251 with **tty**, just the identifier following the characters **tty** (for example, "04").

30252 XSI     **-u *userlist***     Write information for processes whose user ID numbers or login names are given  
30253                                 in *userlist*. The application shall ensure that the *userlist* is a single argument in the  
30254                                 form of a <blank> or comma-separated list. In the listing, the numerical user ID is  
30255                                 written unless the **-f** option is used, in which case the login name is written.

30256             **-U *userlist***     Write information for processes whose real user ID numbers or login names are  
30257                                 given in *userlist*. The application shall ensure that the *userlist* is a single argument  
30258                                 in the form of a <blank> or comma-separated list.

30259             With the exception of **-o *format***, all of the options shown are used to select processes. If any are  
30260             specified, the default list shall be ignored and *ps* shall select the processes represented by the  
30261             bitwise-inclusive OR of all the selection-criteria options.

30262 **OPERANDS**

30263             None.

30264 **STDIN**

30265             Not used.

30266 **INPUT FILES**

30267             None.

30268 **ENVIRONMENT VARIABLES**

30269             The following environment variables shall affect the execution of *ps*:

30270             **COLUMNS**     Override the system-selected horizontal screen size, used to determine the number  
30271                                 of text columns to display. See the System Interface Definitions volume of  
30272                                 IEEE Std. 1003.1-200x, Chapter 8, Environment Variables for valid values and  
30273                                 results when it is unset or null.

30274             **LANG**             Provide a default value for the internationalization variables that are unset or null.  
30275                                 If *LANG* is unset or null, the corresponding value from the implementation-  
30276                                 dependent default locale shall be used. If any of the internationalization variables  
30277                                 contains an invalid setting, the utility shall behave as if none of the variables had  
30278                                 been defined.

30279             **LC\_ALL**            If set to a non-empty string value, override the values of all the other  
30280                                 internationalization variables.

30281             **LC\_CTYPE**        Determine the locale for the interpretation of sequences of bytes of text data as  
30282                                 characters (for example, single-byte as opposed to multi-byte characters in  
30283                                 arguments).

30284             **LC\_MESSAGES**     Determine the locale that should be used to affect the format and contents of  
30285                                 diagnostic messages written to standard error and informative messages written to  
30286                                 standard output.  
30287

30288 XSI     **NLSPATH**     Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

30289             **LC\_TIME**        Determine the format and contents of the date and time strings displayed.

30290 **ASYNCHRONOUS EVENTS**

30291             Default.

30292 **STDOUT**

30293             When the **-o** option is not specified, the standard output format is unspecified.

30294 XSI     On XSI-conformant systems, the output format is as follows. The column headings and  
30295             descriptions of the columns in a *ps* listing are given below. The precise meanings of these fields

are implementation-dependent. The letters 'f' and 'l' (below) indicate the option (**full** or **long**) that shall cause the corresponding heading to appear; **all** means that the heading always appears. Note that these two options determine only what information is provided for a process; they do not determine which processes are listed.

|       |              |       |                                                                                                   |
|-------|--------------|-------|---------------------------------------------------------------------------------------------------|
| 30300 | <b>F</b>     | (l)   | Flags (octal and additive) associated with the process.                                           |
| 30301 | <b>S</b>     | (l)   | The state of the process.                                                                         |
| 30302 | <b>UID</b>   | (f,l) | The user ID number of the process owner; the login name is printed under the <b>-f</b> option.    |
| 30303 |              |       |                                                                                                   |
| 30304 | <b>PID</b>   | (all) | The process ID of the process; it is possible to kill a process if this datum is known.           |
| 30305 |              |       |                                                                                                   |
| 30306 | <b>PPID</b>  | (f,l) | The process ID of the parent process.                                                             |
| 30307 | <b>C</b>     | (f,l) | Processor utilization for scheduling.                                                             |
| 30308 | <b>PRI</b>   | (l)   | The priority of the process; higher numbers mean lower priority.                                  |
| 30309 | <b>NI</b>    | (l)   | Nice value; used in priority computation.                                                         |
| 30310 | <b>ADDR</b>  | (l)   | The address of the process.                                                                       |
| 30311 | <b>SZ</b>    | (l)   | The size in blocks of the core image of the process.                                              |
| 30312 | <b>WCHAN</b> | (l)   | The event for which the process is waiting or sleeping; if blank, the process is running.         |
| 30313 |              |       |                                                                                                   |
| 30314 | <b>STIME</b> | (f)   | Starting time of the process.                                                                     |
| 30315 | <b>TTY</b>   | (all) | The controlling terminal for the process.                                                         |
| 30316 | <b>TIME</b>  | (all) | The cumulative execution time for the process.                                                    |
| 30317 | <b>CMD</b>   | (all) | The command name; the full command name and its arguments are written under the <b>-f</b> option. |
| 30318 |              |       |                                                                                                   |

A process that has exited and has a parent, but has not yet been waited for by the parent, is marked **defunct**.

Under the option **-f**, *ps* tries to determine the command name and arguments given when the process was created by examining memory or the swap area. Failing this, the command name, as it would appear without the option **-f**, is written in square brackets.

The **-o** option allows the output format to be specified under user control.

The application shall ensure that the format specification is a list of names presented as a single argument, <blank> or comma-separated. Each variable has a default header. The default header can be overridden by appending an equals sign and the new text of the header. The rest of the characters in the argument shall be used as the header text. The fields specified shall be written in the order specified on the command line, and should be arranged in columns in the output. The field widths shall be selected by the system to be at least as wide as the header text (default or overridden value). If the header text is null, such as **-o user=**, the field width shall be at least as wide as the default header text. If all header text fields are null, no header line shall be written.

The following names are recognized in the POSIX locale:

|       |               |                                                                                                                                                                    |
|-------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 30335 | <b>ruser</b>  | The real user ID of the process. This shall be the textual user ID, if it can be obtained and the field width permits, or a decimal representation otherwise.      |
| 30336 |               |                                                                                                                                                                    |
| 30337 | <b>user</b>   | The effective user ID of the process. This shall be the textual user ID, if it can be obtained and the field width permits, or a decimal representation otherwise. |
| 30338 |               |                                                                                                                                                                    |
| 30339 | <b>rgroup</b> | The real group ID of the process. This shall be the textual group ID, if it can be obtained and the field width permits, or a decimal representation otherwise.    |
| 30340 |               |                                                                                                                                                                    |

|       |                                                                                                            |                                                                                                                   |
|-------|------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| 30341 | <b>group</b>                                                                                               | The effective group ID of the process. This shall be the textual group ID, if it can be                           |
| 30342 |                                                                                                            | obtained and the field width permits, or a decimal representation otherwise.                                      |
| 30343 | <b>pid</b>                                                                                                 | The decimal value of the process ID.                                                                              |
| 30344 | <b>ppid</b>                                                                                                | The decimal value of the parent process ID.                                                                       |
| 30345 | <b>pgid</b>                                                                                                | The decimal value of the process group ID.                                                                        |
| 30346 | <b>pcpu</b>                                                                                                | The ratio of CPU time used recently to CPU time available in the same period,                                     |
| 30347 |                                                                                                            | expressed as a percentage. The meaning of “recently” in this context is unspecified. The                          |
| 30348 |                                                                                                            | CPU time available is determined in an unspecified manner.                                                        |
| 30349 | <b>vsz</b>                                                                                                 | The size of the process in (virtual) memory in kilobytes as a decimal integer.                                    |
| 30350 | <b>nice</b>                                                                                                | The decimal value of the nice value of the process; see <i>nice</i> on page 698.                                  |
| 30351 | <b>etime</b>                                                                                               | In the POSIX locale, the elapsed time since the process was started, in the form:                                 |
| 30352 |                                                                                                            | [ [ <i>dd</i> -] <i>hh</i> : ] <i>mm</i> : <i>ss</i>                                                              |
| 30353 |                                                                                                            | where <i>dd</i> shall represent the number of days, <i>hh</i> the number of hours, <i>mm</i> the number           |
| 30354 |                                                                                                            | of minutes, and <i>ss</i> the number of seconds. The <i>dd</i> field shall be a decimal integer. The              |
| 30355 |                                                                                                            | <i>hh</i> , <i>mm</i> , and <i>ss</i> fields shall be two-digit decimal integers padded on the left with zeros.   |
| 30356 | <b>time</b>                                                                                                | In the POSIX locale, the cumulative CPU time of the process in the form:                                          |
| 30357 |                                                                                                            | [ [ <i>dd</i> -] <i>hh</i> : <i>mm</i> : <i>ss</i>                                                                |
| 30358 |                                                                                                            | The <i>dd</i> , <i>hh</i> , <i>mm</i> , and <i>ss</i> fields shall be as described in the <b>etime</b> specifier. |
| 30359 | <b>tty</b>                                                                                                 | The name of the controlling terminal of the process (if any) in the same format used by                           |
| 30360 |                                                                                                            | the <i>who</i> utility.                                                                                           |
| 30361 | <b>comm</b>                                                                                                | The name of the command being executed ( <i>argv</i> [0] value) as a string.                                      |
| 30362 | <b>args</b>                                                                                                | The command with all its arguments as a string. The implementation may truncate this                              |
| 30363 |                                                                                                            | value to the field width; it is implementation-dependent whether any further                                      |
| 30364 |                                                                                                            | truncation occurs. It is unspecified whether the string represented is a version of the                           |
| 30365 |                                                                                                            | argument list as it was passed to the command when it started, or is a version of the                             |
| 30366 |                                                                                                            | arguments as they may have been modified by the application. Applications cannot                                  |
| 30367 |                                                                                                            | depend on being able to modify their argument list and having that modification be                                |
| 30368 |                                                                                                            | reflected in the output of <i>ps</i> .                                                                            |
| 30369 | Any field need not be meaningful in all implementations. In such a case a hyphen (‘-’) should              |                                                                                                                   |
| 30370 | be output in place of the field value.                                                                     |                                                                                                                   |
| 30371 | Only <b>comm</b> and <b>args</b> shall be allowed to contain <blank> characters; all others shall not. Any |                                                                                                                   |
| 30372 | implementation-dependent variables shall be specified in the system documentation along with               |                                                                                                                   |
| 30373 | the default header and indicating if the field may contain <blank> characters.                             |                                                                                                                   |
| 30374 | The following table specifies the default header to be used in the POSIX locale corresponding to           |                                                                                                                   |
| 30375 | each format specifier.                                                                                     |                                                                                                                   |

Table 4-17 Variable Names and Default Headers in *ps*

| Format Specifier | Default Header | Format Specifier | Default Header |
|------------------|----------------|------------------|----------------|
| <b>args</b>      | <b>COMMAND</b> | <b>ppid</b>      | <b>PPID</b>    |
| <b>comm</b>      | <b>COMMAND</b> | <b>rgroup</b>    | <b>RGROUP</b>  |
| <b>etime</b>     | <b>ELAPSED</b> | <b>ruser</b>     | <b>RUSER</b>   |
| <b>group</b>     | <b>GROUP</b>   | <b>time</b>      | <b>TIME</b>    |
| <b>nice</b>      | <b>NI</b>      | <b>tty</b>       | <b>TT</b>      |
| <b>pcpu</b>      | <b>%CPU</b>    | <b>user</b>      | <b>USER</b>    |
| <b>pgid</b>      | <b>PGID</b>    | <b>vsz</b>       | <b>VSZ</b>     |
| <b>pid</b>       | <b>PID</b>     |                  |                |

**STDERR**

Used only for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

Things can change while *ps* is running; the snapshot it gives is only true for an instant, and might not be accurate by the time it is displayed.

The **args** format specifier is allowed to produce a truncated version of the command arguments. In some implementations, this information is no longer available when the *ps* utility is executed.

If the field width is too narrow to display a textual ID, the system may use a numeric version. Normally, the system would be expected to choose large enough field widths, but if a large number of fields were selected to write, it might squeeze fields to their minimum sizes to fit on one line. One way to ensure adequate width for the textual IDs is to override the default header for a field to make it larger than most or all user or group names.

There is no special quoting mechanism for header text. The header text is the rest of the argument. If multiple header changes are needed, multiple **-o** options can be used, such as:

```
ps -o "user=User Name" -o pid=Process\ ID
```

On some systems, especially multi-level secure systems, *ps* may be severely restricted and produce information only about child processes owned by the user.

Application writers should note that this utility need not be provided on systems that do not support the User Portability Utilities option.

**EXAMPLES**

The command:

```
ps -o user,pid,ppid=MOM -o args
```

30418 writes at least the following in the POSIX locale:

```
30419 USER PID MOM COMMAND
30420 helene 34 12 ps -o uid,pid,ppid=MOM -o args
```

30421 The contents of the **COMMAND** field need not be the same in all implementations, due to  
30422 possible truncation.

#### 30423 RATIONALE

30424 There is very little commonality between BSD and System V implementations of *ps*. Many  
30425 options conflict or have subtly different usages. The standard developers attempted to select a  
30426 set of options that were useful on a wide range of systems and selected options that either can be  
30427 implemented on both BSD and System V-based systems without breaking the current  
30428 implementations or where the options are sufficiently similar that any changes would not be  
30429 unduly problematic for users or implementors.

30430 It is recognized that on some systems, especially multi-level secure systems, *ps* may be nearly  
30431 useless. The default output has therefore been chosen such that it does not break historical  
30432 implementations and also is likely to provide at least some useful information on most systems.

30433 The major change is the addition of the format specification capability. The motivation for this  
30434 invention is to provide a mechanism for users to access a wider range of system information, if  
30435 the system permits it, in a portable manner. The fields chosen to appear in this volume of  
30436 IEEE Std. 1003.1-200x were arrived at after considering what concepts were likely to be both  
30437 reasonably useful to the “average” user and had a reasonable chance of being implemented on a  
30438 wide range of systems. Again it is recognized that not all systems are able to provide all the  
30439 information and, conversely, some may wish to provide more. It is hoped that the approach  
30440 adopted will be sufficiently flexible and extensible to accommodate most systems.  
30441 Implementations may be expected to introduce new format specifiers.

30442 The default output should consist of a short listing containing the process ID, terminal name,  
30443 cumulative execution time, and command name of each process.

30444 The preference of the standard developers would have been to make the format specification an  
30445 operand of the *ps* command. Unfortunately, BSD usage precluded this.

30446 At one time a format was included to display the environment array of the process. This was  
30447 deleted because there is no portable way to display it.

30448 The **-A** option is equivalent to the BSD **-g** and the SVID **-e**. Because the two systems differed, a  
30449 mnemonic compromise was selected.

30450 The **-a** option is described with some optional behavior because the SVID omits session leaders,  
30451 but BSD does not.

30452 In an early proposal, format specifiers appeared for priority and start time. The former was not  
30453 defined adequately in this volume of IEEE Std. 1003.1-200x and was removed in deference to the  
30454 defined nice value; the latter because elapsed time was considered to be more useful.

30455 In a new BSD version of *ps*, a **-O** option can be used to write all of the default information,  
30456 followed by additional format specifiers. This was not adopted because the default output is  
30457 implementation-dependent. Nevertheless, this is a useful option that should be reserved for that  
30458 purpose. In the **-o** option for the POSIX Shell and Utilities *ps*, the format is the concatenation of  
30459 each **-o**. Therefore, the user can have an alias or function that defines the beginning of their  
30460 desired format and add more fields to the end of the output in certain cases where that would be  
30461 useful.

30462 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
30463 require that they all use the same format.

30464 The **pcpu** field indicates that the CPU time available is determined in an unspecified manner.  
30465 This is because it is difficult to express an algorithm that is useful across all possible machine  
30466 architectures. Historical counterparts to this value have attempted to show percentage of use in  
30467 the recent past, such as the preceding minute. Frequently, these values for all processes did not  
30468 add up to 100%. Implementations are encouraged to provide data in this field to users that will  
30469 help them identify processes currently affecting the performance of the system.

30470 **FUTURE DIRECTIONS**

30471 None.

30474 **CHANGE HISTORY**

30475 First released in Issue 2.

30476 **Issue 4**

30477 Aligned with the ISO/IEC 9945-2:1993 standard.

30478 **Issue 6**

30479 This utility is now marked as part of the User Portability Utilities option. |

30480 The normative text is reworded to avoid use of the term “must” for application requirements. |

## 30481 NAME

30482       pwd — return working directory name

## 30483 SYNOPSIS

30484       pwd [-L | -P ]

## 30485 DESCRIPTION

30486       The *pwd* utility shall write to standard output an absolute path name of the current working  
 30487       directory, which does not contain the file names dot or dot-dot.

## 30488 OPTIONS

30489       The *pwd* utility shall conform to the System Interface Definitions volume of  
 30490       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

30491       The following options shall be supported by the implementation:

30492       **-L**       If the *PWD* environment variable contains an absolute path name of the current  
 30493       directory that does not contain the file names dot or dot-dot, *pwd* shall write this  
 30494       path name to standard output. Otherwise, the **-L** option shall behave as the **-P**  
 30495       option.

30496       **-P**       The absolute path name written shall not contain file names that, in the context of  
 30497       the path name, refer to files of type symbolic link.

30498       If both **-L** and **-P** are specified, the last one shall apply. If neither **-L** nor **-P** is specified, the *pwd*  
 30499       utility shall behave as if **-L** had been specified.

## 30500 OPERANDS

30501       None.

## 30502 STDIN

30503       Not used.

## 30504 INPUT FILES

30505       None.

## 30506 ENVIRONMENT VARIABLES

30507       The following environment variables shall affect the execution of *pwd*:

30508       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 30509       If *LANG* is unset or null, the corresponding value from the implementation-  
 30510       dependent default locale shall be used. If any of the internationalization variables  
 30511       contains an invalid setting, the utility shall behave as if none of the variables had  
 30512       been defined.

30513       **LC\_ALL**      If set to a non-empty string value, override the values of all the other  
 30514       internationalization variables.

30515       **LC\_MESSAGES**

30516       Determine the locale that should be used to affect the format and contents of  
 30517       diagnostic messages written to standard error.

30518 XSI       **NLS\_PATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

30519       **PWD**       If the **-P** option is in effect, this variable shall be set to an absolute path name of  
 30520       the current working directory that does not contain any components that specify  
 30521       symbolic links, does not contain any components that are dot, and does not  
 30522       contain any components that are dot-dot. If an application sets or unsets the value  
 30523       of *PWD*, the behavior of *pwd* is unspecified.

**30524 ASYNCHRONOUS EVENTS**

30525 Default.

**30526 STDOUT**

30527 The *pwd* utility output is an absolute path name of the current working directory:

30528 "%s\n", <directory pathname>

**30529 STDERR**

30530 Used only for diagnostic messages.

**30531 OUTPUT FILES**

30532 None.

**30533 EXTENDED DESCRIPTION**

30534 None.

**30535 EXIT STATUS**

30536 The following exit values shall be returned:

30537 0 Successful completion.

30538 >0 An error occurred.

**30539 CONSEQUENCES OF ERRORS**

30540 If an error is detected, output shall not be written to standard output, a diagnostic message shall  
30541 be written to standard error, and the exit status is not zero.

**30542 APPLICATION USAGE**

30543 None.

**30544 EXAMPLES**

30545 None.

**30546 RATIONALE**

30547 Some implementations have historically provided *pwd* as a shell special built-in command.

30548 In most utilities, if an error occurs, partial output may be written to standard output. This does  
30549 not happen in historical implementations of *pwd*. Because *pwd* is frequently used in historical  
30550 shell scripts without checking the exit status, it is important that the historical behavior is  
30551 required here; therefore, the CONSEQUENCES OF ERRORS section specifically disallows any  
30552 partial output being written to standard output.

**30553 FUTURE DIRECTIONS**

30554 None.

**30557 CHANGE HISTORY**

30558 First released in Issue 2.

**30559 Issue 4**

30560 Aligned with the ISO/IEC 9945-2: 1993 standard.

**30561 Issue 6**

30562 The *-P* and *-L* options are added to describe actions relating to symbolic links as specified in the  
30563 IEEE P1003.2b draft standard.

## 30564 NAME

30565 qalter — alter batch job

## 30566 SYNOPSIS

```
30567 BE qalter [-a date_time][-A account_string][-c interval][-e path_name]
30568 [-h hold_list][-j join_list][-k keep_list][-l resource_list]
30569 [-m mail_options][-M mail_list][-N name][-o path_name]
30570 [-p priority][-r y|n][-S path_name_list][-u user_list]
30571 job_identifier ...
30572
```

## 30573 DESCRIPTION

30574 The attributes of a batch job are altered by a request to the batch server that manages the batch  
 30575 job. The *qalter* utility is a user-accessible batch client that requests the alteration of the attributes  
 30576 of one or more batch jobs.

30577 The *qalter* utility shall alter the attributes of those batch jobs, and only those batch jobs, for which  
 30578 a batch *job\_identifier* is presented to the utility.

30579 The *qalter* utility shall alter the attributes of batch jobs in the order in which the batch  
 30580 *job\_identifiers* are presented to the utility.

30581 If the *qalter* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 30582 process the remaining batch *job\_identifiers*, if any.

30583 For each batch *job\_identifier* for which the *qalter* utility succeeds, each attribute of the identified  
 30584 batch job shall be altered as indicated by all the options presented to the utility.

30585 For each identified batch job for which the *qalter* utility fails, the utility shall not alter any  
 30586 attribute of the batch job.

30587 For each batch job that the *qalter* utility processes, the utility shall not modify any attribute other  
 30588 than those required by the options and option-arguments presented to the utility.

30589 The *qalter* utility shall alter batch jobs by sending a *Modify Job Request* to the batch server that  
 30590 manages each batch job. At the time the *qalter* utility exits, it shall have modified the batch job  
 30591 corresponding to each successfully processed batch *job\_identifier*. An attempt to alter the  
 30592 attributes of a batch job in the RUNNING state is implementation-dependent.

## 30593 OPTIONS

30594 The *qalter* utility shall conform to the System Interface Definitions volume of  
 30595 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

30596 The following options shall be supported by the implementation:

30597 **-a date\_time** Redefine the time at which the batch job becomes eligible for execution.

30598 The *qalter* utility shall accept an option-argument that conforms to the syntax of  
 30599 the *date\_time* operand of the *touch* utility.

30600 The *qalter* utility shall set the *Execution\_Time* attribute of the batch job to the  
 30601 number of seconds since the Epoch that is equivalent to the local time expressed  
 30602 by the value of the *date\_time* option-argument. Specifying a *date\_time* option-  
 30603 argument that represents a time (number of seconds since the Epoch) earlier than  
 30604 the time at which the utility exits shall have the same effect on batch job execution  
 30605 as if the **-a** option had not been presented to the utility. The Epoch is defined in the  
 30606 System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 3.151, Epoch.

30607 **-A account\_string**

30608 Redefine the account to which the resource consumption of the batch job should be

|       |                     |                                                                                                          |  |
|-------|---------------------|----------------------------------------------------------------------------------------------------------|--|
| 30609 |                     | charged.                                                                                                 |  |
| 30610 |                     | The syntax of the <i>account_string</i> option-argument is unspecified.                                  |  |
| 30611 |                     | The <i>qalter</i> utility shall set the <i>Account_Name</i> attribute of the batch job to the value      |  |
| 30612 |                     | of the <i>account_string</i> option-argument.                                                            |  |
| 30613 | <b>-c interval</b>  | Redefine whether the batch job should be checkpointed, and if so, how often.                             |  |
| 30614 |                     | The <i>qalter</i> utility shall accept a value for the interval option-argument that is one of           |  |
| 30615 |                     | the following:                                                                                           |  |
| 30616 | <i>n</i>            | No checkpointing is to be performed on the batch batch job                                               |  |
| 30617 |                     | (NO_CHECKPOINT).                                                                                         |  |
| 30618 | <i>s</i>            | Checkpointing is to be performed only when the batch server is shut                                      |  |
| 30619 |                     | down (CHECKPOINT_AT_SHUTDOWN).                                                                           |  |
| 30620 | <i>c</i>            | Automatic periodic checkpointing is to be performed at the                                               |  |
| 30621 |                     | <i>Minimum_Cpu_Interval</i> attribute of the batch queue, in units of CPU                                |  |
| 30622 |                     | minutes (CHECKPOINT_AT_MIN_CPU_INTERVAL).                                                                |  |
| 30623 | <i>c=minutes</i>    | Automatic periodic checkpointing is to be performed every <i>minutes</i>                                 |  |
| 30624 |                     | of CPU time, or every <i>Minimum_Cpu_Interval</i> minutes, whichever is                                  |  |
| 30625 |                     | greater. The <i>minutes</i> argument shall conform to the syntax for                                     |  |
| 30626 |                     | unsigned integers and shall be greater than zero.                                                        |  |
| 30627 |                     | An implementation may define other checkpoint intervals. The conformance                                 |  |
| 30628 |                     | document for an implementation shall describe any alternative checkpoint                                 |  |
| 30629 |                     | intervals, how they are specified, their internal behavior, and how they affect the                      |  |
| 30630 |                     | behavior of the utility.                                                                                 |  |
| 30631 |                     | The <i>qalter</i> utility shall set the <i>Checkpoint</i> attribute of the batch job to the value of the |  |
| 30632 |                     | <i>interval</i> option-argument.                                                                         |  |
| 30633 | <b>-e path_name</b> | Redefine the path to be used for the standard error stream of the batch job.                             |  |
| 30634 |                     | The <i>qalter</i> utility shall accept a <i>path_name</i> option-argument that conforms to the           |  |
| 30635 |                     | syntax of the <i>path_name</i> element defined in the POSIX.1-1990 standard, which can                   |  |
| 30636 |                     | be preceded by a host name element of the form <i>hostname</i> :                                         |  |
| 30637 |                     | If the <i>path_name</i> option-argument constitutes an absolute path name, the <i>qalter</i>             |  |
| 30638 |                     | utility shall set the <i>Error_Path</i> attribute of the batch job to the value of the                   |  |
| 30639 |                     | <i>path_name</i> option-argument, including the host name element, if present.                           |  |
| 30640 |                     | If the <i>path_name</i> option-argument constitutes a relative path name and no host                     |  |
| 30641 |                     | name element is specified, the <i>qalter</i> utility shall set the <i>Error_Path</i> attribute of the    |  |
| 30642 |                     | batch job to the value of the absolute path name derived by expanding the                                |  |
| 30643 |                     | <i>path_name</i> option-argument relative to the current directory of the process that                   |  |
| 30644 |                     | executes the <i>qalter</i> utility.                                                                      |  |
| 30645 |                     | If the <i>path_name</i> option-argument constitutes a relative path name and a host name                 |  |
| 30646 |                     | element is specified, the <i>qalter</i> utility shall set the <i>Error_Path</i> attribute of the batch   |  |
| 30647 |                     | job to the value of the option-argument without expansion.                                               |  |
| 30648 |                     | If the <i>path_name</i> option-argument does not include a host name element, the <i>qalter</i>          |  |
| 30649 |                     | utility shall prefix the path name in the <i>Error_Path</i> attribute with <i>hostname</i> :, where      |  |
| 30650 |                     | <i>hostname</i> is the name of the host upon which the <i>qalter</i> utility is being executed.          |  |
| 30651 | <b>-h hold_list</b> | Redefine the types of holds, if any, on the batch job. The <i>qalter</i> <b>-h</b> option shall          |  |
| 30652 |                     | accept a value for the <i>hold_list</i> option-argument that is a string of alphanumeric                 |  |

|       |                     |                                                                                                             |
|-------|---------------------|-------------------------------------------------------------------------------------------------------------|
| 30653 |                     | characters in the portable character set (see the System Interface Definitions                              |
| 30654 |                     | volume of IEEE Std. 1003.1-200x, Section 6.1, Portable Character Set).                                      |
| 30655 |                     | The <i>qalter</i> utility shall accept a value for the <i>hold_list</i> option-argument that is a           |
| 30656 |                     | string of one or more of the characters 'u', 's', or 'o', or the single character                           |
| 30657 |                     | 'n'. For each unique character in the <i>hold_list</i> option-argument, the <i>qalter</i> utility           |
| 30658 |                     | shall add a value to the <i>Hold_Types</i> attribute of the batch job as follows, each                      |
| 30659 |                     | representing a different hold type:                                                                         |
| 30660 |                     | <b>u</b> USER                                                                                               |
| 30661 |                     | <b>s</b> SYSTEM                                                                                             |
| 30662 |                     | <b>o</b> OPERATOR                                                                                           |
| 30663 |                     | If any of these characters are duplicated in the <i>hold_list</i> option-argument, the                      |
| 30664 |                     | duplicates shall be ignored. An existing <i>Hold_Types</i> attribute can be cleared by the                  |
| 30665 |                     | hold type:                                                                                                  |
| 30666 |                     | <b>n</b> NO_HOLD                                                                                            |
| 30667 |                     | The <i>qalter</i> utility shall consider it an error if any hold type other than <b>n</b> is combined       |
| 30668 |                     | with hold type <b>n</b> . Strictly conforming applications shall not repeat any of the                      |
| 30669 |                     | characters 'u', 's', 'o', or 'n' within the <i>hold_list</i> option-argument. The <i>qalter</i>             |
| 30670 |                     | utility shall permit the repetition of characters, but shall not assign additional                          |
| 30671 |                     | meaning to the repeated characters. An implementation may define other hold                                 |
| 30672 |                     | types. The conformance document for an implementation shall describe any                                    |
| 30673 |                     | additional hold types, how they are specified, their internal behavior, and how                             |
| 30674 |                     | they affect the behavior of the utility.                                                                    |
| 30675 | <b>-j join_list</b> | Redefine which streams of the batch job are to be merged. The <i>qalter</i> <b>-j</b> option shall          |
| 30676 |                     | accept a value for the <i>join_list</i> option-argument that is a string of alphanumeric                    |
| 30677 |                     | characters in the portable character set (see the System Interface Definitions                              |
| 30678 |                     | volume of IEEE Std. 1003.1-200x, Section 6.1, Portable Character Set).                                      |
| 30679 |                     | The <i>qalter</i> utility shall accept a <i>join_list</i> option-argument that consists of one or           |
| 30680 |                     | more of the characters 'e' and 'o', or the single character 'n'.                                            |
| 30681 |                     | All of the other batch job output streams specified shall be merged into the output                         |
| 30682 |                     | stream represented by the character listed first in the <i>join_list</i> option-argument.                   |
| 30683 |                     | For each unique character in the <i>join_list</i> option-argument, the <i>qalter</i> utility shall          |
| 30684 |                     | add a value to the <i>Join_Path</i> attribute of the batch job as follows, each representing                |
| 30685 |                     | a different batch job stream to join:                                                                       |
| 30686 |                     | <b>e</b> The standard error of the batch batch job (JOIN_STD_ERROR).                                        |
| 30687 |                     | <b>o</b> The standard output of the batch batch job (JOIN_STD_OUTPUT).                                      |
| 30688 |                     | An existing <i>Join_Path</i> attribute can be cleared by the join type:                                     |
| 30689 |                     | <b>n</b> NO_JOIN                                                                                            |
| 30690 |                     | If <b>n</b> is specified, then no files are joined. The <i>qalter</i> utility shall consider it an error if |
| 30691 |                     | any join type other than <b>n</b> is combined with join type <b>n</b> .                                     |
| 30692 |                     | Strictly conforming applications shall not repeat any of the characters 'e', 'o', or                        |
| 30693 |                     | 'n' within the <i>join_list</i> option-argument. The <i>qalter</i> utility shall permit the                 |
| 30694 |                     | repetition of characters, but shall not assign additional meaning to the repeated                           |
| 30695 |                     | characters.                                                                                                 |

|       |                         |                                                                                                            |
|-------|-------------------------|------------------------------------------------------------------------------------------------------------|
| 30696 |                         | An implementation may define other join types. The conformance document for an                             |
| 30697 |                         | implementation shall describe any additional batch job streams, how they are                               |
| 30698 |                         | specified, their internal behavior, and how they affect the behavior of the utility.                       |
| 30699 | <b>-k keep_list</b>     | Redefine which output of the batch job to retain on the execution host.                                    |
| 30700 |                         | The <i>qalter</i> <b>-k</b> option shall accept a value for the <i>keep_list</i> option-argument that is a |
| 30701 |                         | string of alphanumeric characters in the portable character set (see the System                            |
| 30702 |                         | Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable                               |
| 30703 |                         | Character Set).                                                                                            |
| 30704 |                         | The <i>qalter</i> utility shall accept a <i>keep_list</i> option-argument that consists of one or          |
| 30705 |                         | more of the characters 'e' and 'o' or the single character 'n'.                                            |
| 30706 |                         | For each unique character in the <i>keep_list</i> option-argument, the <i>qalter</i> utility shall         |
| 30707 |                         | add a value to the <i>Keep_Files</i> attribute of the batch job as follows, each representing              |
| 30708 |                         | a different batch job stream to keep:                                                                      |
| 30709 | <b>e</b>                | The standard error of the batch batch job (KEEP_STD_ERROR).                                                |
| 30710 | <b>o</b>                | The standard output of the batch batch job (KEEP_STD_OUTPUT).                                              |
| 30711 |                         | If both 'e' and 'o' are specified, then both files are retained. An existing                               |
| 30712 |                         | <i>Keep_Files</i> attribute can be cleared by the keep type:                                               |
| 30713 | <b>n NO_KEEP</b>        |                                                                                                            |
| 30714 |                         | If <b>n</b> is specified, then no files are retained. The <i>qalter</i> utility shall consider it an error |
| 30715 |                         | if any keep type other than <b>n</b> is combined with keep type <b>n</b> .                                 |
| 30716 |                         | Strictly conforming applications shall not repeat any of the characters 'e', 'o', or                       |
| 30717 |                         | 'n' within the <i>keep_list</i> option-argument. The <i>qalter</i> utility shall permit the                |
| 30718 |                         | repetition of characters, but shall not assign additional meaning to the repeated                          |
| 30719 |                         | characters. An implementation may define other keep types. The conformance                                 |
| 30720 |                         | document for an implementation shall describe any additional keep types, how                               |
| 30721 |                         | they are specified, their internal behavior, and how they affect the behavior of the                       |
| 30722 |                         | utility.                                                                                                   |
| 30723 | <b>-l resource_list</b> |                                                                                                            |
| 30724 |                         | Redefine the resources that are allowed or required by the batch job.                                      |
| 30725 |                         | The <i>qalter</i> utility shall accept a <i>resource_list</i> option-argument that conforms to the         |
| 30726 |                         | following syntax:                                                                                          |
| 30727 |                         | resource=value[, ,resource=value, ,...]                                                                    |
| 30728 |                         | The <i>qalter</i> utility shall set one entry in the value of the <i>Resource_List</i> attribute of the    |
| 30729 |                         | batch job for each resource listed in the <i>resource_list</i> option-argument.                            |
| 30730 |                         | Because the list of supported resource names might vary by batch server, the <i>qalter</i>                 |
| 30731 |                         | utility shall rely on the batch server to validate the resource names and associated                       |
| 30732 |                         | values. See Section 3.3.3 on page 157 for a means of removing <i>keyword=value</i> (and                    |
| 30733 |                         | <i>value@keyword</i> ) pairs and other general rules for list-oriented batch job attributes.               |
| 30734 | <b>-m mail_options</b>  |                                                                                                            |
| 30735 |                         | Redefine the points in the execution of the batch job at which the batch server is to                      |
| 30736 |                         | send mail about a change in the state of the batch job.                                                    |
| 30737 |                         | The <i>qalter</i> <b>-m</b> option shall accept a value for the <i>mail_options</i> option-argument that   |
| 30738 |                         | is a string of alphanumeric characters in the portable character set (see the System                       |
| 30739 |                         | Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable                               |

|       |                            |                                                                                                          |
|-------|----------------------------|----------------------------------------------------------------------------------------------------------|
| 30740 |                            | Character Set).                                                                                          |
| 30741 |                            | The <i>qalter</i> utility shall accept a value for the <i>mail_options</i> option-argument that is a     |
| 30742 |                            | string of one or more of the characters 'e', 'b', and 'a', or the single character                       |
| 30743 |                            | 'n'. For each unique character in the <i>mail_options</i> option-argument, the <i>qalter</i>             |
| 30744 |                            | utility shall add a value to the <i>Mail_Users</i> attribute of the batch job as follows, each           |
| 30745 |                            | representing a different time during the life of a batch job at which to send mail:                      |
| 30746 | <i>e</i>                   | MAIL_AT_EXIT                                                                                             |
| 30747 | <i>b</i>                   | MAIL_AT_BEGINNING                                                                                        |
| 30748 | <i>a</i>                   | MAIL_AT_ABORT                                                                                            |
| 30749 |                            | If any of these characters are duplicated in the <i>mail_options</i> option-argument, the                |
| 30750 |                            | duplicates shall be ignored.                                                                             |
| 30751 |                            | An existing <i>Mail_Points</i> attribute can be cleared by the mail type:                                |
| 30752 | <i>n</i>                   | NO_MAIL                                                                                                  |
| 30753 |                            | If <i>n</i> is specified, then mail is not sent. The <i>qalter</i> utility shall consider it an error if |
| 30754 |                            | any mail type other than <i>n</i> is combined with mail type <i>n</i> . Strictly conforming              |
| 30755 |                            | applications shall not repeat any of the characters 'e', 'b', 'a', or 'n' within                         |
| 30756 |                            | the <i>mail_options</i> option-argument. The <i>qalter</i> utility shall permit the repetition of        |
| 30757 |                            | characters but shall not assign additional meaning to the repeated characters.                           |
| 30758 |                            | An implementation may define other mail types. The conformance document for                              |
| 30759 |                            | an implementation shall describe any additional mail types, how they are                                 |
| 30760 |                            | specified, their internal behavior, and how they affect the behavior of the utility.                     |
| 30761 | <b>-M</b> <i>mail_list</i> | Redefine the list of users to which the batch server that executes the batch job is to                   |
| 30762 |                            | send mail, if the batch server sends mail about the batch job.                                           |
| 30763 |                            | The syntax of the <i>mail_list</i> option-argument is unspecified. If the implementation                 |
| 30764 |                            | of the <i>qalter</i> utility uses a name service to locate users, the utility shall accept the           |
| 30765 |                            | syntax used by the name service.                                                                         |
| 30766 |                            | If the implementation of the <i>qalter</i> utility does not use a name service to locate                 |
| 30767 |                            | users, the implementation shall accept the following syntax for user names:                              |
| 30768 |                            | mail_address[, ,mail_address, , ...]                                                                     |
| 30769 |                            | The interpretation of <i>mail_address</i> is implementation-dependent.                                   |
| 30770 |                            | The <i>qalter</i> utility shall set the <i>Mail_Users</i> attribute of the batch job to the value of     |
| 30771 |                            | the <i>mail_list</i> option-argument.                                                                    |
| 30772 | <b>-N</b> <i>name</i>      | Redefine the name of the batch job.                                                                      |
| 30773 |                            | The <i>qalter</i> <b>-N</b> option shall accept a value for the <i>name</i> option argument that is a    |
| 30774 |                            | string of up to 15 alphanumeric characters in the portable character set (see the                        |
| 30775 |                            | System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable                      |
| 30776 |                            | Character Set) where the first character is alphabetic.                                                  |
| 30777 |                            | The syntax of the <i>name</i> option-argument is unspecified.                                            |
| 30778 |                            | The <i>qalter</i> utility shall set the <i>Job_Name</i> attribute of the batch job to the value of the   |
| 30779 |                            | <i>name</i> option-argument.                                                                             |
| 30780 | <b>-o</b> <i>path_name</i> | Redefine the path for the standard output of the batch job.                                              |

|       |                          |                                                                                                            |
|-------|--------------------------|------------------------------------------------------------------------------------------------------------|
| 30781 |                          | The <i>qalter</i> utility shall accept a <i>path_name</i> option-argument that conforms to the             |
| 30782 |                          | syntax of the <i>path_name</i> element defined in the POSIX.1-1990 standard, which can                     |
| 30783 |                          | be preceded by a host name element of the form <i>hostname</i> ..                                          |
| 30784 |                          | If the <i>path_name</i> option-argument constitutes an absolute path name, the <i>qalter</i>               |
| 30785 |                          | utility shall set the <i>Output_Path</i> attribute of the batch job to the value of the                    |
| 30786 |                          | <i>path_name</i> option-argument.                                                                          |
| 30787 |                          | If the <i>path_name</i> option-argument constitutes a relative path name and no host                       |
| 30788 |                          | name element is specified, the <i>qalter</i> utility shall set the <i>Output_Path</i> attribute of the     |
| 30789 |                          | batch job to the absolute path name derived by expanding the <i>path_name</i> option-                      |
| 30790 |                          | argument relative to the current directory of the process that executes the <i>qalter</i>                  |
| 30791 |                          | utility.                                                                                                   |
| 30792 |                          | If the <i>path_name</i> option-argument constitutes a relative path name and a host name                   |
| 30793 |                          | element is specified, the <i>qalter</i> utility shall set the <i>Output_Path</i> attribute of the batch    |
| 30794 |                          | job to option-argument without any expansion of the path name.                                             |
| 30795 |                          | If the <i>path_name</i> option-argument does not include a host name element, the <i>qalter</i>            |
| 30796 |                          | utility shall prefix the path name in the <i>Output_Path</i> attribute with <i>hostname</i> .,             |
| 30797 |                          | where <i>hostname</i> is the name of the host upon which the <i>qalter</i> utility is being                |
| 30798 |                          | executed.                                                                                                  |
| 30799 | <b>-p priority</b>       | Redefine the priority of the batch job.                                                                    |
| 30800 |                          | The <i>qalter</i> utility shall accept a value for the priority option-argument that                       |
| 30801 |                          | conforms to the syntax for signed decimal integers, and which is not less than                             |
| 30802 |                          | -1 024 and not greater than 1 023.                                                                         |
| 30803 |                          | The <i>qalter</i> utility shall set the <i>Priority</i> attribute of the batch job to the value of the     |
| 30804 |                          | <i>priority</i> option-argument.                                                                           |
| 30805 | <b>-r y   n</b>          | Redefine whether the batch job is rerunnable.                                                              |
| 30806 |                          | If the value of the option-argument is <i>y</i> , the <i>qalter</i> utility shall set the <i>Rerunable</i> |
| 30807 |                          | attribute of the batch job to TRUE.                                                                        |
| 30808 |                          | If the value of the option-argument is <i>n</i> , the <i>qalter</i> utility shall set the <i>Rerunable</i> |
| 30809 |                          | attribute of the batch job to FALSE.                                                                       |
| 30810 |                          | The <i>qalter</i> utility shall consider it an error if any character other than 'y' or 'n' is             |
| 30811 |                          | specified in the option-argument.                                                                          |
| 30812 | <b>-S path_name_list</b> |                                                                                                            |
| 30813 |                          | Redefine the shell that interprets the script at the destination system.                                   |
| 30814 |                          | The <i>qalter</i> utility shall accept a <i>path_name_list</i> option-argument that conforms to            |
| 30815 |                          | the following syntax:                                                                                      |
| 30816 |                          | pathname[@host][, , pathname[@host] , , . . . ]                                                            |
| 30817 |                          | The <i>qalter</i> utility shall accept only one path name that is missing a corresponding                  |
| 30818 |                          | host name. The <i>qalter</i> utility shall allow only one path name per named host.                        |
| 30819 |                          | The <i>qalter</i> utility shall add a value to the <i>Shell_Path_List</i> attribute of the batch job       |
| 30820 |                          | for each entry in the <i>path_name_list</i> option-argument. See Section 3.3.3 on page 157                 |
| 30821 |                          | for a means of removing <i>keyword=value</i> (and <i>value@keyword</i> ) pairs and other                   |
| 30822 |                          | general rules for list-oriented batch job attributes.                                                      |
| 30823 | <b>-u user_list</b>      | Redefine the user name under which the batch job is to run at the destination                              |
| 30824 |                          | system.                                                                                                    |

|       |                              |                                                                                                         |
|-------|------------------------------|---------------------------------------------------------------------------------------------------------|
| 30825 |                              | The <i>qalter</i> utility shall accept a <i>user_list</i> option-argument that conforms to the          |
| 30826 |                              | following syntax:                                                                                       |
| 30827 |                              | <code>username[@host][, ,username[@host], , ...]</code>                                                 |
| 30828 |                              | The <i>qalter</i> utility shall accept only one user name that is missing a corresponding               |
| 30829 |                              | host name. The <i>qalter</i> utility shall accept only one user name per named host.                    |
| 30830 |                              | The <i>qalter</i> utility shall add a value to the <i>User_List</i> attribute of the batch job for each |
| 30831 |                              | entry in the <i>user_list</i> option-argument. See Section 3.3.3 on page 157 for a means of             |
| 30832 |                              | removing <i>keyword=value</i> (and <i>value@keyword</i> ) pairs and other general rules for             |
| 30833 |                              | list-oriented batch job attributes.                                                                     |
| 30834 | <b>OPERANDS</b>              |                                                                                                         |
| 30835 |                              | The <i>qalter</i> utility shall accept one or more operands that conform to the syntax for a batch      |
| 30836 |                              | <i>job_identifier</i> (see Section 3.3.1 on page 156).                                                  |
| 30837 | <b>STDIN</b>                 |                                                                                                         |
| 30838 |                              | Not used.                                                                                               |
| 30839 | <b>INPUT FILES</b>           |                                                                                                         |
| 30840 |                              | None.                                                                                                   |
| 30841 | <b>ENVIRONMENT VARIABLES</b> |                                                                                                         |
| 30842 |                              | The following environment variables shall affect the execution of <i>qalter</i> :                       |
| 30843 | <i>LANG</i>                  | Provide a default value for the internationalization variables that are unset or null.                  |
| 30844 |                              | If <i>LANG</i> is unset or null, the corresponding value from the implementation-                       |
| 30845 |                              | dependent default locale shall be used. If any of the internationalization variables                    |
| 30846 |                              | contains an invalid setting, the utility shall behave as if none of the variables had                   |
| 30847 |                              | been defined.                                                                                           |
| 30848 | <i>LC_ALL</i>                | If set to a non-empty string value, override the values of all the other                                |
| 30849 |                              | internationalization variables.                                                                         |
| 30850 | <i>LC_CTYPE</i>              | Determine the locale for the interpretation of sequences of bytes of text data as                       |
| 30851 |                              | characters (for example, single-byte as opposed to multi-byte characters in                             |
| 30852 |                              | arguments).                                                                                             |
| 30853 | <i>LC_MESSAGES</i>           |                                                                                                         |
| 30854 |                              | Determine the locale that should be used to affect the format and contents of                           |
| 30855 |                              | diagnostic messages written to standard error.                                                          |
| 30856 | <i>LC_TIME</i>               | Determine the format and contents of date and time strings written by <i>qalter</i> .                   |
| 30857 | <i>LOGNAME</i>               | Determine the login name of the user.                                                                   |
| 30858 | <i>TZ</i>                    | Determine the timezone in which the time and date are written. If the <i>TZ</i> variable                |
| 30859 |                              | is not set, an unspecified system default timezone is used.                                             |
| 30860 | <b>ASYNCHRONOUS EVENTS</b>   |                                                                                                         |
| 30861 |                              | Default.                                                                                                |
| 30862 | <b>STDOUT</b>                |                                                                                                         |
| 30863 |                              | None.                                                                                                   |
| 30864 | <b>STDERR</b>                |                                                                                                         |
| 30865 |                              | Used only for diagnostic messages.                                                                      |

30866 **OUTPUT FILES**

30867 None.

30868 **EXTENDED DESCRIPTION**

30869 None.

30870 **EXIT STATUS**

30871 The following exit values shall be returned:

30872 0 Successful completion.

30873 &gt;0 An error occurred.

30874 **CONSEQUENCES OF ERRORS**

30875 In addition to the default behavior, the *qalter* utility shall not be required to write a diagnostic  
 30876 message to standard error when the error reply received from a batch server indicates that the  
 30877 batch *job\_identifier* does not exist on the server. Whether or not the *qalter* utility attempts to  
 30878 locate the batch job on other batch servers is implementation-dependent.

30879 **APPLICATION USAGE**

30880 None.

30881 **EXAMPLES**

30882 None.

30883 **RATIONALE**30884 The *qalter* utility allows users to change the attributes of a batch job.

30885 As a means of altering a queued job, the *qalter* utility is superior to deleting and requeuing the  
 30886 batch job insofar as an altered job retains its place in the queue with some traditional selection  
 30887 algorithms. In addition, the *qalter* utility is both shorter and simpler than a sequence of *qdel* and  
 30888 *qsub* utilities.

30889 The result of an attempt on the part of a user to alter a batch job in a RUNNING state is  
 30890 implementation-dependent because a batch job in the RUNNING state will already have opened  
 30891 its output files and otherwise performed any actions indicated by the options in effect at the  
 30892 time the batch job began execution.

30893 The options processed by the *qalter* utility are identical to those of the *qsub* utility, with a few  
 30894 exceptions: *-V*, *-v*, and *-q*. The *-V* and *-v* are inappropriate for the *qalter* utility, since they  
 30895 capture potentially transient environment information from the submitting process. The *-q*  
 30896 option would specify a new queue, which would largely negate the previously stated advantage  
 30897 of using *qalter*; furthermore, the *qmove* utility provides a superior means of moving jobs.

30898 Each of the following paragraphs provides the rationale for a *qalter* option.30899 Additional rationale concerning these options can be found in the rationale for the *qsub* utility.

30900 The *-a* option allows users to alter the date and time at which a batch job becomes eligible to  
 30901 run.

30902 The *-A* option allows users to change the account that will be charged for the resources  
 30903 consumed by the batch job. Support for the *-A* option is mandatory for conforming  
 30904 implementations of *qalter*, even though support of accounting is optional for servers. Whether or  
 30905 not to support accounting is left to the implementor of the server, but mandatory support of the  
 30906 *-A* option assures users of a consistent interface and allows them to control accounting on  
 30907 servers that support accounting.

30908 The *-c* option allows users to alter the checkpointing interval of a batch job. A checkpointing  
 30909 system, which is not defined by IEEE Std. 1003.1-200x, allows recovery of a batch job at the most

30910 recent checkpoint in the event of a crash. Checkpointing is typically used for jobs that consume  
 30911 expensive computing time or must meet a critical schedule. Users should be allowed to make  
 30912 the tradeoff between the overhead of checkpointing and the risk to the timely completion of the  
 30913 batch job; therefore, this volume of IEEE Std. 1003.1-200x provides the checkpointing interval  
 30914 option. Support for checkpointing is optional for servers.

30915 The **-e** option allows users to alter the name and location of the standard error stream written by  
 30916 a batch job. However, the path of the standard error stream is meaningless if the value of the  
 30917 *Join\_Path* attribute of the batch job is TRUE.

30918 The **-h** option allows users to set the hold type in the *Hold\_Types* attribute of a batch job. The  
 30919 *qhold* and *qrls* utilities add or remove hold types to the *Hold\_Types* attribute, respectively. The **-h**  
 30920 option has been modified to allow for implementation-dependent hold types.

30921 The **-j** option allows users to alter the decision to join (merge) the standard error stream of the  
 30922 batch job with the standard output stream of the batch job.

30923 The **-l** option allows users to change the resource limits imposed on a batch job.

30924 The **-m** option allows users to modify the list of points in the life of a batch job at which the  
 30925 designated users will receive mail notification.

30926 The **-M** option allows users to alter the list of users who will receive notification about events in  
 30927 the life of a batch job.

30928 The **-N** option allows users to change the name of a batch job.

30929 The **-o** option allows users to alter the name and path to which the standard output stream of  
 30930 the batch job will be written.

30931 The **-P** option allows users to modify the priority of a batch job. Support for priority is optional  
 30932 for batch servers.

30933 The **-r** option allows users to alter the rerunability status of a batch job.

30934 The **-S** option allows users to change the name and location of the shell image that will be  
 30935 invoked to interpret the script of the batch job. This option has been modified to allow a list of  
 30936 shell name and locations associated with different host.

30937 The **-u** option allows users to change the user identifier under which the batch job will execute.

30938 As with other batch utilities, implementors can extend the *qalter* utility using the **-W** option.

30939 The *job\_identifier* operand syntax is provided so that the user can differentiate between the  
 30940 originating and destination (or executing) batch server. These may or may not be the same. The  
 30941 *.server\_name* portion identifies the originating batch server, while the *@server* portion identifies  
 30942 the destination batch server.

30943 Historically, the *qalter* utility has been a component of the Network Queuing System (NQS), the  
 30944 existing practice from which this utility has been derived.

#### 30945 FUTURE DIRECTIONS

30946 None.

#### 30949 CHANGE HISTORY

30950 Derived from IEEE Std. 1003.2d-1994.

30951 **NAME**

30952           qdel — delete batch jobs

30953 **SYNOPSIS**30954 BE       qdel *job\_identifier* ...

30955

30956 **DESCRIPTION**

30957       A batch job is deleted by sending a request to the batch server that manages the batch job. A  
 30958       batch job that has been deleted is no longer subject to management by batch services.

30959       The *qdel* utility is a user-accessible client of batch services that requests the deletion of one or  
 30960       more batch jobs.

30961       The *qdel* utility shall request a batch server to delete those batch jobs for which a batch  
 30962       *job\_identifier* is presented to the utility.

30963       The *qdel* utility shall delete batch jobs in the order in which their batch *job\_identifiers* are  
 30964       presented to the utility.

30965       If the *qdel* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 30966       process the remaining batch *job\_identifiers*, if any.

30967       The *qdel* utility shall delete each batch job by sending a *Delete Job Request* to the batch server that  
 30968       manages the batch job.

30969       The *qdel* utility shall not exit until the batch job corresponding to each successfully processed  
 30970       batch *job\_identifier* has been deleted.

30971 **OPTIONS**

30972       None.

30973 **OPERANDS**

30974       The *qdel* utility shall accept one or more operands that conform to the syntax for a batch  
 30975       *job\_identifier* (see Section 3.3.1 on page 156).

30976 **STDIN**

30977       Not used.

30978 **INPUT FILES**

30979       None.

30980 **ENVIRONMENT VARIABLES**30981       The following environment variables shall affect the execution of *qdel*:

30982       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 30983       If *LANG* is unset or null, the corresponding value from the implementation-  
 30984       dependent default locale shall be used. If any of the internationalization variables  
 30985       contains an invalid setting, the utility shall behave as if none of the variables had  
 30986       been defined.

30987       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 30988       internationalization variables.

30989       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 30990       characters (for example, single-byte as opposed to multi-byte characters in  
 30991       arguments).

30992       *LC\_MESSAGES*

30993       Determine the locale that should be used to affect the format and contents of  
 30994       diagnostic messages written to standard error.

|       |                               |                                                                                                                      |
|-------|-------------------------------|----------------------------------------------------------------------------------------------------------------------|
| 30995 | <i>LC_TIME</i>                | Determine the format and contents of date and time strings written by <i>qdel</i> .                                  |
| 30996 | <i>LOGNAME</i>                | Determine the login name of the user.                                                                                |
| 30997 | <i>TZ</i>                     | Determine the timezone in which the time and date are written. If the <i>TZ</i> variable                             |
| 30998 |                               | is not set, an unspecified system default timezone is used.                                                          |
| 30999 | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                      |
| 31000 |                               | Default.                                                                                                             |
| 31001 | <b>STDOUT</b>                 |                                                                                                                      |
| 31002 |                               | An implementation of the <i>qdel</i> utility may write informative messages to standard output.                      |
| 31003 | <b>STDERR</b>                 |                                                                                                                      |
| 31004 |                               | Used only for diagnostic messages.                                                                                   |
| 31005 | <b>OUTPUT FILES</b>           |                                                                                                                      |
| 31006 |                               | None.                                                                                                                |
| 31007 | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                      |
| 31008 |                               | None.                                                                                                                |
| 31009 | <b>EXIT STATUS</b>            |                                                                                                                      |
| 31010 |                               | The following exit values shall be returned:                                                                         |
| 31011 | 0                             | Successful completion.                                                                                               |
| 31012 | >0                            | An error occurred.                                                                                                   |
| 31013 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                      |
| 31014 |                               | In addition to the default behavior, the <i>qdel</i> utility shall not be required to write a diagnostic             |
| 31015 |                               | message to standard error when the error reply received from a batch server indicates that the                       |
| 31016 |                               | batch <i>job_identifier</i> does not exist on the server. Whether or not the <i>qdel</i> utility waits to output the |
| 31017 |                               | diagnostic message while attempting to locate the job on other servers is implementation-                            |
| 31018 |                               | dependent.                                                                                                           |
| 31019 | <b>APPLICATION USAGE</b>      |                                                                                                                      |
| 31020 |                               | None.                                                                                                                |
| 31021 | <b>EXAMPLES</b>               |                                                                                                                      |
| 31022 |                               | None.                                                                                                                |
| 31023 | <b>RATIONALE</b>              |                                                                                                                      |
| 31024 |                               | The <i>qdel</i> utility allows users and administrators to delete jobs.                                              |
| 31025 |                               | The <i>qdel</i> utility provides functionality that is not otherwise available. For example, the <i>kill</i> utility |
| 31026 |                               | of the operating system does not suffice. First, to use the <i>kill</i> utility, the user might have to log in       |
| 31027 |                               | on a remote node, because the <i>kill</i> utility does not operate across the network. Second, unlike                |
| 31028 |                               | <i>qdel</i> , <i>kill</i> cannot remove jobs from queues. Lastly, the arguments of the <i>qdel</i> utility are job   |
| 31029 |                               | identifiers rather than process identifiers, and so this utility can be passed the output of the                     |
| 31030 |                               | <i>qselect</i> utility, thus providing users with a means of deleting a list of jobs.                                |
| 31031 |                               | Because a set of jobs can be selected using the <i>qselect</i> utility, the <i>qdel</i> utility has not been         |
| 31032 |                               | complicated with options that provide for selection of jobs. Instead, the batch jobs to be deleted                   |
| 31033 |                               | are identified individually by their job identifiers.                                                                |
| 31034 |                               | Historically, the <i>qdel</i> utility has been a component of NQS, the existing practice on which it is              |
| 31035 |                               | based. However, the <i>qdel</i> utility defined in this volume of IEEE Std. 1003.1-200x does not provide             |
| 31036 |                               | an option for specifying a signal number to send to the batch job prior to the killing of the                        |
| 31037 |                               | process; that capability has been subsumed by the <i>qsig</i> utility.                                               |

31038 A discussion was held about the delays of networking and the possibility that the batch server  
31039 may never respond, due to a down router, down batch server, or other network mishap. The  
31040 DESCRIPTION records this under the words “fails to process any job identifier”. In the broad  
31041 sense, the network problem is also an error, which causes the failure to process the batch job  
31042 identifier.

31043 As with other batch utilities, implementors can extend the *qdel* utility using the **-W** option.

31044 **FUTURE DIRECTIONS**

31045 None.

31048 **CHANGE HISTORY**

31049 Derived from IEEE Std. 1003.2d-1994.

## 31050 NAME

31051 qhold — hold batch jobs

## 31052 SYNOPSIS

31053 BE qhold [-h *hold\_list*] *job\_identifier* ...

31054

## 31055 DESCRIPTION

31056 A hold is placed on a batch job by a request to the batch server that manages the batch job. A  
 31057 batch job that has one or more holds is not eligible for execution. The *qhold* utility is a user-  
 31058 accessible client of batch services that requests one or more types of hold to be placed on one or  
 31059 more batch jobs.

31060 The *qhold* utility shall place holds on those batch jobs for which a batch *job\_identifier* is presented  
 31061 to the utility.

31062 The *qhold* utility shall place holds on batch jobs in the order in which their batch *job\_identifiers*  
 31063 are presented to the utility. If the *qhold* utility fails to process any batch *job\_identifier* successfully,  
 31064 the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

31065 The *qhold* utility shall place holds on each batch job by sending a *Hold Job Request* to the batch  
 31066 server that manages the batch job.

31067 The *qhold* utility shall not exit until holds have been placed on the batch job corresponding to  
 31068 each successfully processed batch *job\_identifier*.

## 31069 OPTIONS

31070 The *qhold* utility shall conform to the System Interface Definitions volume of  
 31071 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

31072 The following option shall be supported by the implementation:

31073 **-h *hold\_list*** Define the types of holds to be placed on the batch job.

31074 The *qhold* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 31075 string of alphanumeric characters in the portable character set (see the System  
 31076 Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable  
 31077 Character Set).

31078 The *qhold* utility shall accept a value for the *hold\_list* option-argument that is a  
 31079 string of one or more of the characters 'u', 's', or 'o', or the single character  
 31080 'n'.

31081 For each unique character in the *hold\_list* option-argument, the *qhold* utility shall  
 31082 add a value to the *Hold\_Types* attribute of the batch job as follows, each  
 31083 representing a different hold type:

31084 **u** USER

31085 **s** SYSTEM

31086 **o** OPERATOR

31087 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 31088 duplicates shall be ignored.

31089 An existing *Hold\_Types* attribute can be cleared by the following hold type:

31090 **n** NO\_HOLD

31091 The *qhold* utility shall consider it an error if any hold type other than **n** is combined  
 31092 with hold type **n**.

31093 Strictly conforming applications shall not repeat any of the characters 'u', 's',  
 31094 'o', or 'n' within the *hold\_list* option-argument. The *qhold* utility shall permit the  
 31095 repetition of characters, but shall not assign additional meaning to the repeated  
 31096 characters.

31097 An implementation may define other hold types. The conformance document for  
 31098 an implementation shall describe any additional hold types, how they are  
 31099 specified, their internal behavior, and how they affect the behavior of the utility.

31100 If the *-h* option is not presented to the *qhold* utility, the implementation shall set  
 31101 the *Hold\_Types* attribute to USER.

#### 31102 OPERANDS

31103 The *qhold* utility shall accept one or more operands that conform to the syntax for a batch  
 31104 *job\_identifier* (see Section 3.3.1 on page 156).

#### 31105 STDIN

31106 Not used.

#### 31107 INPUT FILES

31108 None.

#### 31109 ENVIRONMENT VARIABLES

31110 The following environment variables shall affect the execution of *qhold*:

31111 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 31112 If *LANG* is unset or null, the corresponding value from the implementation-  
 31113 dependent default locale shall be used. If any of the internationalization variables  
 31114 contains an invalid setting, the utility shall behave as if none of the variables had  
 31115 been defined.

31116 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 31117 internationalization variables.

31118 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 31119 characters (for example, single-byte as opposed to multi-byte characters in  
 31120 arguments).

#### 31121 LC\_MESSAGES

31122 Determine the locale that should be used to affect the format and contents of  
 31123 diagnostic messages written to standard error.

31124 *LC\_TIME* Determine the format and contents of date and time strings written by *qhold*.

31125 *LOGNAME* Determine the login name of the user.

31126 *TZ* Determine the timezone in which the time and date are written. If the *TZ* variable  
 31127 is not set, an unspecified system default timezone is used.

#### 31128 ASYNCHRONOUS EVENTS

31129 Default.

#### 31130 STDOUT

31131 None.

#### 31132 STDERR

31133 Used only for diagnostic messages.

31134 **OUTPUT FILES**

31135 None.

31136 **EXTENDED DESCRIPTION**

31137 None.

31138 **EXIT STATUS**

31139 The following exit values shall be returned:

31140 0 Successful completion.

31141 &gt;0 An error occurred.

31142 **CONSEQUENCES OF ERRORS**

31143 In addition to the default behavior, the *qhold* utility shall not be required to write a diagnostic  
31144 message to standard error when the error reply received from a batch server indicates that the  
31145 batch *job\_identifier* does not exist on the server. Whether or not the *qhold* utility waits to output  
31146 the diagnostic message while attempting to locate the job on other servers is implementation-  
31147 dependent.

31148 **APPLICATION USAGE**

31149 None.

31150 **EXAMPLES**

31151 None.

31152 **RATIONALE**

31153 The *qhold* utility allows users to place a hold on one or more jobs. A hold makes a batch job  
31154 ineligible for execution.

31155 The *qhold* utility has options that allow the user to specify the type of hold. Should the user wish  
31156 to place a hold on a set of jobs that meet a selection criteria, such a list of jobs can be acquired  
31157 using the *qselect* utility.

31158 The *-h* option allows the user to specify the type of hold that is to be placed on the job. This  
31159 option allows for USER, SYSTEM, OPERATOR, and implementation-dependent hold types. The  
31160 USER and OPERATOR holds are distinct. The batch server that manages the batch job will verify  
31161 that the user is authorized to set the specified hold for the batch job.

31162 Mail is not required on hold because the administrator has the tools and libraries to build this  
31163 option if he or she wishes.

31164 As with other batch utilities, implementors may extend the *qhold* utility using the *-W* option.

31165 Historically, the *qhold* utility has been a part of some existing batch systems, although it has not  
31166 traditionally been a part of the NQS.

31167 **FUTURE DIRECTIONS**

31168 None.

31169 **SEE ALSO**31170 *qselect*, Chapter 3 on page 13331171 **CHANGE HISTORY**

31172 Derived from IEEE Std. 1003.2d-1994.

31173 **NAME**

31174           qmove — move batch jobs

31175 **SYNOPSIS**31176 BE       qmove *destination job\_identifier* ...

31177

31178 **DESCRIPTION**

31179       To move a batch job is to remove the batch job from the batch queue in which it resides and  
 31180       instantiate the batch job in another batch queue. A batch job is moved by a request to the batch  
 31181       server that manages the batch job. The *qmove* utility is a user-accessible batch client that requests  
 31182       the movement of one or more batch jobs.

31183       The *qmove* utility shall move those batch jobs, and only those batch jobs, for which a batch  
 31184       *job\_identifier* is presented to the utility.

31185       The *qmove* utility shall move batch jobs in the order in which the corresponding batch  
 31186       *job\_identifiers* are presented to the utility.

31187       If the *qmove* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 31188       process the remaining batch *job\_identifiers*, if any.

31189       The *qmove* utility shall move batch jobs by sending a *Move Job Request* to the batch server that  
 31190       manages each batch job. The *qmove* utility shall not exit before the batch jobs corresponding to all  
 31191       successfully processed batch *job\_identifiers* have been moved.

31192 **OPTIONS**

31193       None.

31194 **OPERANDS**

31195       The *qmove* utility shall accept one operand that conforms to the syntax for a *destination* (see  
 31196       Section 3.3.2 on page 157).

31197       The *qmove* utility shall accept one or more operands that conform to the syntax for a batch  
 31198       *job\_identifier* (see Section 3.3.1 on page 156).

31199 **STDIN**

31200       Not used.

31201 **INPUT FILES**

31202       None.

31203 **ENVIRONMENT VARIABLES**31204       The following environment variables shall affect the execution of *qmove*:

31205       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 31206       If *LANG* is unset or null, the corresponding value from the implementation-  
 31207       dependent default locale shall be used. If any of the internationalization variables  
 31208       contains an invalid setting, the utility shall behave as if none of the variables had  
 31209       been defined.

31210       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 31211       internationalization variables.

31212       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 31213       characters (for example, single-byte as opposed to multi-byte characters in  
 31214       arguments).

31215       *LC\_MESSAGES*

31216       Determine the locale that should be used to affect the format and contents of

|       |                               |                                                                                                                   |
|-------|-------------------------------|-------------------------------------------------------------------------------------------------------------------|
| 31217 |                               | diagnostic messages written to standard error.                                                                    |
| 31218 | <i>LC_TIME</i>                | Determine the format and contents of date and time strings written by <i>qmove</i> .                              |
| 31219 | <i>LOGNAME</i>                | Determine the login name of the user.                                                                             |
| 31220 | <i>TZ</i>                     | Determine the timezone in which the time and date are written. If the <i>TZ</i> variable                          |
| 31221 |                               | is not set, an unspecified system default timezone is used.                                                       |
| 31222 | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                   |
| 31223 |                               | Default.                                                                                                          |
| 31224 | <b>STDOUT</b>                 |                                                                                                                   |
| 31225 |                               | None.                                                                                                             |
| 31226 | <b>STDERR</b>                 |                                                                                                                   |
| 31227 |                               | Used only for diagnostic messages.                                                                                |
| 31228 | <b>OUTPUT FILES</b>           |                                                                                                                   |
| 31229 |                               | None.                                                                                                             |
| 31230 | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                   |
| 31231 |                               | None.                                                                                                             |
| 31232 | <b>EXIT STATUS</b>            |                                                                                                                   |
| 31233 |                               | The following exit values shall be returned:                                                                      |
| 31234 | 0                             | Successful completion.                                                                                            |
| 31235 | >0                            | An error occurred.                                                                                                |
| 31236 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                   |
| 31237 |                               | In addition to the default behavior, the <i>qmove</i> utility shall not be required to write a diagnostic         |
| 31238 |                               | message to standard error when the error reply received from a batch server indicates that the                    |
| 31239 |                               | batch <i>job_identifier</i> does not exist on the server. Whether or not the <i>qmove</i> utility waits to output |
| 31240 |                               | the diagnostic message while attempting to locate the job on other servers is implementation-                     |
| 31241 |                               | dependent.                                                                                                        |
| 31242 | <b>APPLICATION USAGE</b>      |                                                                                                                   |
| 31243 |                               | None.                                                                                                             |
| 31244 | <b>EXAMPLES</b>               |                                                                                                                   |
| 31245 |                               | None.                                                                                                             |
| 31246 | <b>RATIONALE</b>              |                                                                                                                   |
| 31247 |                               | The <i>qmove</i> utility allows users to move jobs between queues.                                                |
| 31248 |                               | The alternative to using the <i>qmove</i> utility—deleting the batch job and requeuing it—entails                 |
| 31249 |                               | considerably more typing.                                                                                         |
| 31250 |                               | Since the means of selecting jobs based on attributes has been encapsulated in the <i>qselect</i> utility,        |
| 31251 |                               | the only option of the <i>qmove</i> utility concerns authorization. The <b>-u</b> option provides the user with   |
| 31252 |                               | the convenience of changing the user identifier under which the batch job will execute.                           |
| 31253 |                               | Minimalism and consistency has taken precedence over convenience; the <b>-u</b> option has been                   |
| 31254 |                               | deleted because the equivalent capability exists with the <b>-u</b> option of the <i>qalter</i> utility.          |
| 31255 |                               | As with other batch utilities, implementors can extend the <i>qmove</i> utility using the <b>-W</b> option.       |
| 31256 |                               | The <i>qmove</i> utility is new, <i>vis-a-vis</i> existing practice; it has been defined in this volume of        |
| 31257 |                               | IEEE Std. 1003.1-200x as a logical extension of existing practice.                                                |

31263 Derived from IEEE Std. 1003.2d-1994.

## 31264 NAME

31265 qmsg — send message to batch jobs

## 31266 SYNOPSIS

31267 BE qmsg [-E][-O] *message\_string* *job\_identifier* ...

31268

## 31269 DESCRIPTION

31270 To send a message to a batch job is to request that a server write a message string into one or  
 31271 more output files of the batch job. A message is sent to a batch job by a request to the batch  
 31272 server that manages the batch job. The *qmsg* utility is a user-accessible batch client that requests  
 31273 the sending of messages to one or more batch jobs.

31274 The *qmsg* utility shall write messages into the files of batch jobs by sending a *Job Message Request*  
 31275 to the batch server that manages the batch job. The *qmsg* utility shall not directly write the  
 31276 message into the files of the batch job.

31277 The *qmsg* utility shall send a *Job Message Request* for those batch jobs, and only those batch jobs,  
 31278 for which a batch *job\_identifier* is presented to the utility.

31279 The *qmsg* utility shall send *Job Message Requests* for batch jobs in the order in which their batch  
 31280 *job\_identifiers* are presented to the utility.

31281 If the *qmsg* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 31282 process the remaining batch *job\_identifiers*, if any.

31283 The *qmsg* utility shall not exit before a *Job Message Request* has been sent to the server that  
 31284 manages the batch job that corresponds to each successfully processed batch *job\_identifier*.

## 31285 OPTIONS

31286 The *qmsg* utility shall conform to the System Interface Definitions volume of  
 31287 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

31288 The following options shall be supported by the implementation:

31289 -E Specify that the message is written to the standard error of each batch job.

31290 The *qmsg* utility shall write the message into the standard error of the batch job.

31291 -O Specify that the message is written to the standard output of each batch job.

31292 The *qmsg* utility shall write the message into the standard output of the batch job.

31293 If neither the -O nor the -E option is presented to the *qmsg* utility, the utility shall write the  
 31294 message into an implementation-dependent file. The conformance document for the  
 31295 implementation shall describe the name and location of the implementation-dependent file. If  
 31296 both the -O and the -E options are presented to the *qmsg* utility, then the utility shall write the  
 31297 messages to both standard output and standard error.

## 31298 OPERANDS

31299 The *qmsg* utility shall accept a minimum of two operands, *message\_string* and one or more batch  
 31300 *job\_identifiers*.

31301 The *message\_string* operand shall be the string to be written to one or more output files of the  
 31302 batch job followed by a <newline>. If the string contains <blank>s, then the string must be  
 31303 quoted. The *message\_string* shall be encoded in the portable character set (see the System  
 31304 Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable Character Set).

31305 All remaining operands are batch *job\_identifiers* that conform to the syntax for a batch  
 31306 *job\_identifier* (see Section 3.3.1 on page 156).

31307 **STDIN**

31308 Not used.

31309 **INPUT FILES**

31310 None.

31311 **ENVIRONMENT VARIABLES**31312 The following environment variables shall affect the execution of *qmsg*:

31313 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 31314 If *LANG* is unset or null, the corresponding value from the implementation-  
 31315 dependent default locale shall be used. If any of the internationalization variables  
 31316 contains an invalid setting, the utility shall behave as if none of the variables had  
 31317 been defined.

31318 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 31319 internationalization variables.

31320 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 31321 characters (for example, single-byte as opposed to multi-byte characters in  
 31322 arguments).

31323 *LC\_MESSAGES*

31324 Determine the locale that should be used to affect the format and contents of  
 31325 diagnostic messages written to standard error.

31326 *LC\_TIME* Determine the format and contents of date and time strings written by *qmsg*.

31327 *LOGNAME* Determine the login name of the user.

31328 *TZ* Determine the timezone in which the time and date are written. If the *TZ* variable  
 31329 is not set, an unspecified system default timezone is used.

31330 **ASYNCHRONOUS EVENTS**

31331 Default.

31332 **STDOUT**

31333 None.

31334 **STDERR**

31335 Used only for diagnostic messages.

31336 **OUTPUT FILES**

31337 None.

31338 **EXTENDED DESCRIPTION**

31339 None.

31340 **EXIT STATUS**

31341 The following exit values shall be returned:

31342 0 Successful completion.

31343 &gt;0 An error occurred.

31344 **CONSEQUENCES OF ERRORS**

31345 In addition to the default behavior, the *qmsg* utility shall not be required to write a diagnostic  
 31346 message to standard error when the error reply received from a batch server indicates that the  
 31347 batch *job\_identifier* does not exist on the server. Whether or not the *qmsg* utility waits to output  
 31348 the diagnostic message while attempting to locate the job on other servers is implementation-  
 31349 dependent.

**31350 APPLICATION USAGE**

31351 None.

**31352 EXAMPLES**

31353 None.

**31354 RATIONALE**

31355 The *qmsg* utility allows users to write messages into the output files of running jobs. Users,  
31356 including operators and administrators, have a number of occasions when they want to place  
31357 messages in the output files of a batch job. For example, if a disk that is being used by a batch job  
31358 is showing errors, the operator might note this in the standard error stream of the batch job.

31359 The options of the *qmsg* utility provide users with the means of placing the message in the  
31360 output stream of their choice. The default output stream for the message—if the user does not  
31361 designate an output stream—is implementation-dependent, since many implementations will  
31362 provide, as an extension to this volume of IEEE Std. 1003.1-200x, a log file that shows the history  
31363 of utility execution.

31364 If users wish to send a message to a set of jobs that meet a selection criteria, the *qselect* utility can  
31365 be used to acquire the appropriate list of job identifiers.

31366 The **-E** option allows users to place the message in the standard error stream of the batch job.

31367 The **-O** option allows users to place the message in the standard output stream of the batch job.

31368 As with other batch utilities, implementors may extend the *qmsg* utility using to the **-W** option.

31369 Historically, the *qmsg* utility is an existing practice in the offerings of one or more implementors  
31370 of an NQS-derived batch system. The utility has been found to be useful enough that it deserves  
31371 to be included in this volume of IEEE Std. 1003.1-200x.

**31372 FUTURE DIRECTIONS**

31373 None.

31375 *qselect*, Chapter 3 on page 133

**31376 CHANGE HISTORY**

31377 Derived from IEEE Std. 1003.2d-1994.

31378 **NAME**

31379 qrerun — rerun batch jobs

31380 **SYNOPSIS**31381 BE qrerun *job\_identifier* ...

31382

31383 **DESCRIPTION**

31384 To rerun a batch job is to terminate the session leader of the batch job, delete any associated  
 31385 checkpoint files, and return the batch job to the batch queued state. A batch job is rerun by a  
 31386 request to the batch server that manages the batch job. The *qrerun* utility is a user-accessible  
 31387 batch client that requests the rerunning of one or more batch jobs.

31388 The *qrerun* utility shall rerun those batch jobs for which a batch *job\_identifier* is presented to the  
 31389 utility.

31390 The *qrerun* utility shall rerun batch jobs in the order in which their batch *job\_identifiers* are  
 31391 presented to the utility.

31392 If the *qrerun* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed  
 31393 to process the remaining batch *job\_identifiers*, if any.

31394 The *qrerun* utility shall rerun batch jobs by sending a *Rerun Job Request* to the batch server that  
 31395 manages each batch job.

31396 For each successfully processed batch *job\_identifier*, the *qrerun* utility shall have rerun the  
 31397 corresponding batch batch job at the time the utility exits.

31398 **OPTIONS**

31399 None.

31400 **OPERANDS**

31401 The *qrerun* utility shall accept one or more operands that conform to the syntax for a batch  
 31402 *job\_identifier* (see Section 3.3.1 on page 156).

31403 **STDIN**

31404 Not used.

31405 **INPUT FILES**

31406 None.

31407 **ENVIRONMENT VARIABLES**31408 The following environment variables shall affect the execution of *qrerun*:

31409 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 31410 If *LANG* is unset or null, the corresponding value from the implementation-  
 31411 dependent default locale shall be used. If any of the internationalization variables  
 31412 contains an invalid setting, the utility shall behave as if none of the variables had  
 31413 been defined.

31414 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 31415 internationalization variables.

31416 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 31417 characters (for example, single-byte as opposed to multi-byte characters in  
 31418 arguments).

31419 *LC\_MESSAGES*

31420 Determine the locale that should be used to affect the format and contents of  
 31421 diagnostic messages written to standard error.

|       |                               |                                                                                                                      |
|-------|-------------------------------|----------------------------------------------------------------------------------------------------------------------|
| 31422 | <i>LC_TIME</i>                | Determine the format and contents of date and time strings written by <i>qrerun</i> .                                |
| 31423 | <i>LOGNAME</i>                | Determine the login name of the user.                                                                                |
| 31424 | <i>TZ</i>                     | Determine the timezone in which the time and date are written. If the <i>TZ</i> variable                             |
| 31425 |                               | is not set, an unspecified system default timezone is used.                                                          |
| 31426 | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                      |
| 31427 |                               | Default.                                                                                                             |
| 31428 | <b>STDOUT</b>                 |                                                                                                                      |
| 31429 |                               | None.                                                                                                                |
| 31430 | <b>STDERR</b>                 |                                                                                                                      |
| 31431 |                               | Used only for diagnostic messages.                                                                                   |
| 31432 | <b>OUTPUT FILES</b>           |                                                                                                                      |
| 31433 |                               | None.                                                                                                                |
| 31434 | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                      |
| 31435 |                               | None.                                                                                                                |
| 31436 | <b>EXIT STATUS</b>            |                                                                                                                      |
| 31437 |                               | The following exit values shall be returned:                                                                         |
| 31438 | 0                             | Successful completion.                                                                                               |
| 31439 | >0                            | An error occurred.                                                                                                   |
| 31440 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                      |
| 31441 |                               | In addition to the default behavior, the <i>qrerun</i> utility shall not be required to write a diagnostic           |
| 31442 |                               | message to standard error when the error reply received from a batch server indicates that the                       |
| 31443 |                               | batch <i>job_identifier</i> does not exist on the server. Whether or not the <i>qrerun</i> utility waits to output   |
| 31444 |                               | the diagnostic message while attempting to locate the job on other servers is implementation-                        |
| 31445 |                               | dependent.                                                                                                           |
| 31446 | <b>APPLICATION USAGE</b>      |                                                                                                                      |
| 31447 |                               | None.                                                                                                                |
| 31448 | <b>EXAMPLES</b>               |                                                                                                                      |
| 31449 |                               | None.                                                                                                                |
| 31450 | <b>RATIONALE</b>              |                                                                                                                      |
| 31451 |                               | The <i>qrerun</i> utility allows users to cause jobs in the running state to exit and rerun.                         |
| 31452 |                               | As with other batch utilities, implementors may extend the <i>qrerun</i> utility using the <b>-W</b> option.         |
| 31453 |                               | The <i>qrerun</i> utility is a new utility, <i>vis-a-vis</i> existing practice, that has been defined in this volume |
| 31454 |                               | of IEEE Std. 1003.1-200x to correct user-perceived deficiencies in the existing practice.                            |
| 31455 | <b>FUTURE DIRECTIONS</b>      |                                                                                                                      |
| 31456 |                               | None.                                                                                                                |
| 31457 | <b>SEE ALSO</b>               |                                                                                                                      |
| 31458 |                               | Chapter 3 on page 133                                                                                                |
| 31459 | <b>CHANGE HISTORY</b>         |                                                                                                                      |

## 31461 NAME

31462 qrln — release batch jobs

## 31463 SYNOPSIS

31464 BE qrln [-h *hold\_list*] *job\_identifier* ...

31465

## 31466 DESCRIPTION

31467 A batch job might have one or more holds, which prevent the batch job from executing. A batch  
 31468 job from which all the holds have been removed becomes eligible for execution and is said to  
 31469 have been released. A batch job hold is removed by sending a request to the batch server that  
 31470 manages the batch job. The *qrln* utility is a user-accessible client of batch services that requests  
 31471 holds be removed from one or more batch jobs.

31472 The *qrln* utility shall remove one or more holds from those batch jobs for which a batch  
 31473 *job\_identifier* is presented to the utility.

31474 The *qrln* utility shall remove holds from batch jobs in the order in which their batch *job\_identifiers*  
 31475 are presented to the utility.

31476 If the *qrln* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 31477 process the remaining batch *job\_identifiers*, if any.

31478 The *qrln* utility shall remove holds on each batch job by sending a *Release Job Request* to the batch  
 31479 server that manages the batch job.

31480 The *qrln* utility shall not exit until the holds have been removed from the batch job  
 31481 corresponding to each successfully processed batch *job\_identifier*.

## 31482 OPTIONS

31483 The *qrln* utility shall conform to the System Interface Definitions volume of  
 31484 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

31485 The following option shall be supported by the implementation:

31486 **-h *hold\_list*** Define the types of holds to be removed from the batch job.

31487 The *qrln* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 31488 string of alphanumeric characters in the portable character set (see the System  
 31489 Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable  
 31490 Character Set).

31491 The *qrln* utility shall accept a value for the *hold\_list* option-argument that is a string  
 31492 of one or more of the characters 'u', 's', or 'o', or the single character 'n'.

31493 For each unique character in the *hold\_list* option-argument, the *qrln* utility shall add  
 31494 a value to the *Hold\_Types* attribute of the batch job as follows, each representing a  
 31495 different hold type:

31496 **u** USER

31497 **s** SYSTEM

31498 **o** OPERATOR

31499 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 31500 duplicates shall be ignored.

31501 An existing *Hold\_Types* attribute can be cleared by the following hold type:

31502 **n** NO\_HOLD

|       |                              |                                                                                                      |
|-------|------------------------------|------------------------------------------------------------------------------------------------------|
| 31503 |                              | The <i>qrls</i> utility shall consider it an error if any hold type other than <b>n</b> is combined  |
| 31504 |                              | with hold type <b>n</b> .                                                                            |
| 31505 |                              | Strictly conforming applications shall not repeat any of the characters 'u', 's',                    |
| 31506 |                              | 'o', or 'n' within the <i>hold_list</i> option-argument. The <i>qrls</i> utility shall permit the    |
| 31507 |                              | repetition of characters, but shall not assign additional meaning to the repeated                    |
| 31508 |                              | characters.                                                                                          |
| 31509 |                              | An implementation may define other hold types. The conformance document for                          |
| 31510 |                              | an implementation shall describe any additional hold types, how they are                             |
| 31511 |                              | specified, their internal behavior, and how they affect the behavior of the utility.                 |
| 31512 |                              | If the <b>-h</b> option is not presented to the <i>qrls</i> utility, the implementation shall remove |
| 31513 |                              | the <b>USER</b> hold in the <i>Hold_Types</i> attribute.                                             |
| 31514 | <b>OPERANDS</b>              |                                                                                                      |
| 31515 |                              | The <i>qrls</i> utility shall accept one or more operands that conform to the syntax for a batch     |
| 31516 |                              | <i>job_identifier</i> (see Section 3.3.1 on page 156).                                               |
| 31517 | <b>STDIN</b>                 |                                                                                                      |
| 31518 |                              | Not used.                                                                                            |
| 31519 | <b>INPUT FILES</b>           |                                                                                                      |
| 31520 |                              | None.                                                                                                |
| 31521 | <b>ENVIRONMENT VARIABLES</b> |                                                                                                      |
| 31522 |                              | The following environment variables shall affect the execution of <i>qrls</i> :                      |
| 31523 | <i>LANG</i>                  | Provide a default value for the internationalization variables that are unset or null.               |
| 31524 |                              | If <i>LANG</i> is unset or null, the corresponding value from the implementation-                    |
| 31525 |                              | dependent default locale shall be used. If any of the internationalization variables                 |
| 31526 |                              | contains an invalid setting, the utility shall behave as if none of the variables had                |
| 31527 |                              | been defined.                                                                                        |
| 31528 | <i>LC_ALL</i>                | If set to a non-empty string value, override the values of all the other                             |
| 31529 |                              | internationalization variables.                                                                      |
| 31530 | <i>LC_CTYPE</i>              | Determine the locale for the interpretation of sequences of bytes of text data as                    |
| 31531 |                              | characters (for example, single-byte as opposed to multi-byte characters in                          |
| 31532 |                              | arguments).                                                                                          |
| 31533 | <i>LC_MESSAGES</i>           |                                                                                                      |
| 31534 |                              | Determine the locale that should be used to affect the format and contents of                        |
| 31535 |                              | diagnostic messages written to standard error.                                                       |
| 31536 | <i>LC_TIME</i>               | Determine the format and contents of date and time strings written by <i>qrls</i> .                  |
| 31537 | <i>LOGNAME</i>               | Determine the login name of the user.                                                                |
| 31538 | <i>TZ</i>                    | Determine the timezone in which the time and date are written. If the <i>TZ</i> variable             |
| 31539 |                              | is not set, an unspecified system default timezone is used.                                          |
| 31540 | <b>ASYNCHRONOUS EVENTS</b>   |                                                                                                      |
| 31541 |                              | Default.                                                                                             |
| 31542 | <b>STDOUT</b>                |                                                                                                      |
| 31543 |                              | None.                                                                                                |

**31544 STDERR**

31545           Used only for diagnostic messages.

**31546 OUTPUT FILES**

31547           None.

**31548 EXTENDED DESCRIPTION**

31549           None.

**31550 EXIT STATUS**

31551           The following exit values shall be returned:

31552           0   Successful completion.

31553           >0  An error occurred.

**31554 CONSEQUENCES OF ERRORS**

31555           In addition to the default behavior, the *qrIs* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qrIs* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-dependent.

**31560 APPLICATION USAGE**

31561           None.

**31562 EXAMPLES**

31563           None.

**31564 RATIONALE**

31565           The *qrIs* utility allows users, operators, and administrators to remove holds from jobs.

31566           The *qrIs* utility does not support any job selection options or wildcard arguments. Users may acquire a list of jobs selected by attributes using the *qselect* utility. For example, a user could select all of their held jobs.

31569           The **-h** option allows the user to specify the type of hold that is to be removed. This option allows for USER, SYSTEM, OPERATOR, and implementation-dependent hold types. The batch server that manages the batch job will verify whether the user is authorized to remove the specified hold for the batch job. If more than one type of hold has been placed on the batch job, a user may wish to remove only some of them.

31574           Mail is not required on release because the administrator has the tools and libraries to build this option if required.

31576           As with other batch utilities, implementors may extend the *qrIs* utility by means of the **-W** option.

31578           The *qrIs* utility is a new utility *vis-a-vis* existing practice; it has been defined in this volume of IEEE Std. 1003.1-200x as the natural complement to the *qhold* utility.

**31580 FUTURE DIRECTIONS**

31581           None.

## 31586 NAME

31587 qselect — select batch jobs

## 31588 SYNOPSIS

```
31589 BE qselect [-a [op]date_time][-A account_string][-c [op]interval]
31590 [-h hold_list][-l resource_list][-N name][-p [op]priority]
31591 [-q destination][-r y|n][-s states][-u user_list]
31592
```

## 31593 DESCRIPTION

31594 To select a set of batch jobs is to return the batch *job\_identifiers* for each batch job that meets a list  
 31595 of selection criteria. A set of batch jobs is selected by a request to a batch server. The *qselect*  
 31596 utility is a user-accessible batch client that requests the selection of batch jobs.

31597 Upon successful completion, the *qselect* utility shall have returned a list of zero or more batch  
 31598 *job\_identifiers* that meet the criteria specified by the options and option-arguments presented to  
 31599 the utility.

31600 The *qselect* utility shall select batch jobs by sending a *Select Jobs Request* to a batch server. The  
 31601 *qselect* utility shall not exit until the server replies to each request generated.

31602 For each option presented to the *qselect* utility, the utility shall restrict the set of selected batch  
 31603 jobs as described in the OPTIONS section.

31604 The *qselect* utility shall not restrict selection of batch jobs except by authorization and as required  
 31605 by the options presented to the utility.

31606 When an option is specified with a mandatory or optional *op* component to the option-  
 31607 argument, then *op* shall specify a relation between the value of a certain batch job attribute and  
 31608 the *value* component of the option-argument. If an *op* is allowable on an option, then the  
 31609 description of the option letter indicates the *op* as either mandatory or optional. Acceptable  
 31610 strings for the *op* component, and the relation the string indicates, are shown in the following  
 31611 list:

- |       |      |                                                                                            |
|-------|------|--------------------------------------------------------------------------------------------|
| 31612 | .eq. | The value represented by the attribute of the batch job is equal to the value represented  |
| 31613 |      | by the option-argument.                                                                    |
| 31614 | .ge. | The value represented by the attribute of the batch job is greater than or equal to the    |
| 31615 |      | value represented by the option-argument.                                                  |
| 31616 | .gt. | The value represented by the attribute of the batch job is greater than the value          |
| 31617 |      | represented by the option-argument.                                                        |
| 31618 | .lt. | The value represented by the attribute of the batch job is less than the value             |
| 31619 |      | represented by the option-argument.                                                        |
| 31620 | .le. | The value represented by the attribute of the batch job is less than or equal to the value |
| 31621 |      | represented by the option-argument.                                                        |
| 31622 | .ne. | The value represented by the attribute of the batch job is not equal to the value          |
| 31623 |      | represented by the option-argument.                                                        |

## 31624 OPTIONS

31625 The *qselect* utility shall conform to the System Interface Definitions volume of  
 31626 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

31627 The following options shall be supported by the implementation:

- 31628 **-a [op]date\_time**  
 31629 Restrict selection to a specific time, or a range of times.

31630 The *qselect* utility shall select only batch jobs for which the value of the  
 31631 *Execution\_Time* attribute is related to the Epoch equivalent of the local time  
 31632 expressed by the value of the *date\_time* component of the option-argument in the  
 31633 manner indicated by the value of the *op* component of the option-argument.

31634 The *qselect* utility shall accept a *date\_time* component of the option-argument that  
 31635 conforms to the syntax of the *date\_time* operand of the *touch* utility.

31636 If the *op* component of the option-argument is not presented to the *qselect* utility,  
 31637 the utility shall select batch jobs for which the *Execution\_Time* attribute is equal to  
 31638 the *date\_time* component of the option-argument.

31639 When comparing times, the *qselect* utility shall use the following definitions for the  
 31640 *op* component of the option-argument:

31641 .eq. The time represented by value of the *Execution\_Time* attribute of the batch  
 31642 job is equal the time represented by the *date\_time* component of the  
 31643 option-argument.

31644 .ge. The time represented by value of the *Execution\_Time* attribute of the batch  
 31645 job is after or equal to the time represented by the *date\_time* component of  
 31646 the option-argument.

31647 .gt. The time represented by value of the *Execution\_Time* attribute of the batch  
 31648 job is after the time represented by the *date\_time* component of the  
 31649 option-argument.

31650 .lt. The time represented by value of the *Execution\_Time* attribute of the batch  
 31651 job is before the time represented by the *date\_time* component of the  
 31652 option-argument.

31653 .le. The time represented by value of the *Execution\_Time* attribute of the batch  
 31654 job is before or equal to the time represented by the *date\_time* component  
 31655 of the option-argument.

31656 .ne. The time represented by value of the *Execution\_Time* attribute of the batch  
 31657 job is not equal to the time represented by the *date\_time* component of the  
 31658 option-argument.

31659 The *qselect* utility shall accept the defined character strings for the *op* component of  
 31660 the option-argument.

31661 **-A *account\_string***  
 31662 Restrict selection to the batch jobs charging a specified account.

31663 The *qselect* utility shall select only batch jobs for which the value of the  
 31664 *Account\_Name* attribute of the batch job matches the value of the *account\_string*  
 31665 option-argument.

31666 The syntax of the *account\_string* option-argument is unspecified.

31667 **-c [*op*]*interval***  
 31668 Restrict selection to batch jobs within a range of checkpoint intervals.

31669 The *qselect* utility shall select only batch jobs for which the value of the *Checkpoint*  
 31670 attribute relates to the value of the *interval* component of the option-argument in  
 31671 the manner indicated by the value of the *op* component of the option-argument.

31672 If the *op* component of the option-argument is omitted, the *qselect* utility shall  
 31673 select batch jobs for which the value of the *Checkpoint* attribute is equal to the value

|       |              |                                                                                                      |  |
|-------|--------------|------------------------------------------------------------------------------------------------------|--|
| 31674 |              | of the <i>interval</i> component of the option-argument.                                             |  |
| 31675 |              | When comparing checkpoint intervals, the <i>qselect</i> utility shall use the following              |  |
| 31676 |              | definitions for the <i>op</i> component of the option-argument:                                      |  |
| 31677 |              | .eq. The value of the <i>Checkpoint</i> attribute of the batch job equals the value of               |  |
| 31678 |              | the <i>interval</i> component of the option-argument.                                                |  |
| 31679 |              | .ge. The value of the <i>Checkpoint</i> attribute of the batch job is greater than or                |  |
| 31680 |              | equal to the value of the <i>interval</i> component option-argument.                                 |  |
| 31681 |              | .gt. The value of the <i>Checkpoint</i> attribute of the batch job is greater than the               |  |
| 31682 |              | value of the <i>interval</i> component option-argument.                                              |  |
| 31683 |              | .lt. The value of the <i>Checkpoint</i> attribute of the batch job is less than the value            |  |
| 31684 |              | of the <i>interval</i> component option-argument.                                                    |  |
| 31685 |              | .le. The value of the <i>Checkpoint</i> attribute of the batch job is less than or equal             |  |
| 31686 |              | to the value of the <i>interval</i> component option-argument.                                       |  |
| 31687 |              | .ne. The value of the <i>Checkpoint</i> attribute of the batch job does not equal the                |  |
| 31688 |              | value of the <i>interval</i> component option-argument.                                              |  |
| 31689 |              | The <i>qselect</i> utility shall accept the defined character strings for the <i>op</i> component of |  |
| 31690 |              | the option-argument.                                                                                 |  |
| 31691 |              | The ordering relationship for the values of the interval option-argument is defined                  |  |
| 31692 |              | to be:                                                                                               |  |
| 31693 |              | 'n' .gt. 's' .gt. 'c=minutes' .ge. 'c'                                                               |  |
| 31694 |              | When comparing <i>Checkpoint</i> attributes with an interval having the value of the                 |  |
| 31695 |              | single character 'u', only equality or inequality are valid comparisons.                             |  |
| 31696 | -h hold_list | Restrict selection to batch jobs that have a specific type of hold.                                  |  |
| 31697 |              | The <i>qselect</i> utility shall select only batch jobs for which the value of the <i>Hold_Types</i> |  |
| 31698 |              | attribute matches the value of the <i>hold_list</i> option-argument.                                 |  |
| 31699 |              | The <i>qselect</i> -h option shall accept a value for the <i>hold_list</i> option-argument that is a |  |
| 31700 |              | string of alphanumeric characters in the portable character set (see the System                      |  |
| 31701 |              | Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable                         |  |
| 31702 |              | Character Set).                                                                                      |  |
| 31703 |              | The <i>qselect</i> utility shall accept a value for the <i>hold_list</i> option-argument that is a   |  |
| 31704 |              | string of one or more of the characters 'u', 's', or 'o', or the single character                    |  |
| 31705 |              | 'n'.                                                                                                 |  |
| 31706 |              | Each unique character in the <i>hold_list</i> option-argument of the <i>qselect</i> utility is       |  |
| 31707 |              | defined as follows, each representing a different hold type:                                         |  |
| 31708 |              | <b>u</b> USER                                                                                        |  |
| 31709 |              | <b>s</b> SYSTEM                                                                                      |  |
| 31710 |              | <b>o</b> OPERATOR                                                                                    |  |
| 31711 |              | If any of these characters are duplicated in the <i>hold_list</i> option-argument, the               |  |
| 31712 |              | duplicates shall be ignored.                                                                         |  |
| 31713 |              | The <i>qselect</i> utility shall consider it an error if any hold type other than <b>n</b> is        |  |
| 31714 |              | combined with hold type <b>n</b> .                                                                   |  |

|       |                         |                                                                                                     |
|-------|-------------------------|-----------------------------------------------------------------------------------------------------|
| 31715 |                         | Strictly conforming applications shall not repeat any of the characters 'u', 's',                   |
| 31716 |                         | 'o', or 'n' within the <i>hold_list</i> option-argument. The <i>qselect</i> utility shall permit    |
| 31717 |                         | the repetition of characters, but shall not assign additional meaning to the repeated               |
| 31718 |                         | characters.                                                                                         |
| 31719 |                         | An implementation may define other hold types. The conformance document for                         |
| 31720 |                         | an implementation shall describe any additional hold types, how they are                            |
| 31721 |                         | specified, their internal behavior, and how they affect the behavior of the utility.                |
| 31722 | <b>-I resource_list</b> |                                                                                                     |
| 31723 |                         | Restrict selection to batch jobs with specified resource limits and attributes.                     |
| 31724 |                         | The <i>qselect</i> utility shall accept a <i>resource_list</i> option-argument with the following   |
| 31725 |                         | syntax:                                                                                             |
| 31726 |                         | <i>resource_name op value [ , , resource_name op value , , ... ]</i>                                |
| 31727 |                         | When comparing resource values, the <i>qselect</i> utility shall use the following                  |
| 31728 |                         | definitions for the <i>op</i> component of the option-argument:                                     |
| 31729 | .eq.                    | The value of the resource of the same name in the <i>Resource_List</i> attribute                    |
| 31730 |                         | of the batch job equals the value of the value component of the option-                             |
| 31731 |                         | argument.                                                                                           |
| 31732 | .ge.                    | The value of the resource of the same name in the <i>Resource_List</i> attribute                    |
| 31733 |                         | of the batch job is greater than or equal to the value of the <i>value</i>                          |
| 31734 |                         | component of the option-argument.                                                                   |
| 31735 | .gt.                    | The value of the resource of the same name in the <i>Resource_List</i> attribute                    |
| 31736 |                         | of the batch job is greater than the value of the value component of the                            |
| 31737 |                         | option-argument.                                                                                    |
| 31738 | .lt.                    | The value of the resource of the same name in the <i>Resource_List</i> attribute                    |
| 31739 |                         | of the batch job is less than the value of the value component of the                               |
| 31740 |                         | option-argument.                                                                                    |
| 31741 | .ne.                    | The value of the resource of the same name in the <i>Resource_List</i> attribute                    |
| 31742 |                         | of the batch job does not equal the value of the value component of the                             |
| 31743 |                         | option-argument.                                                                                    |
| 31744 | .le.                    | The value of the resource of the same name in the <i>Resource_List</i> attribute                    |
| 31745 |                         | of the batch job is less than or equal to the value of the <i>value</i> component                   |
| 31746 |                         | of the option-argument.                                                                             |
| 31747 |                         | When comparing the limit of a <i>Resource_List</i> attribute with the <i>value</i> component of     |
| 31748 |                         | the option-argument, if the limit, the value, or both are non-numeric, only equality                |
| 31749 |                         | or inequality are valid comparisons.                                                                |
| 31750 |                         | The <i>qselect</i> utility shall select only batch jobs for which the values of the                 |
| 31751 |                         | <i>resource_names</i> listed in the <i>resource_list</i> option-argument match the corresponding    |
| 31752 |                         | limits of the <i>Resource_List</i> attribute of the batch job.                                      |
| 31753 |                         | Limits of <i>resource_names</i> present in the <i>Resource_List</i> attribute of the batch job that |
| 31754 |                         | have no corresponding values in the <i>resource_list</i> option-argument shall not be               |
| 31755 |                         | considered when selecting batch jobs.                                                               |
| 31756 | <b>-N name</b>          | Restrict selection to batch jobs with a specified name.                                             |
| 31757 |                         | The <i>qselect</i> utility shall select only batch jobs for which the value of the <i>Job_Name</i>  |
| 31758 |                         | attribute matches the value of the <i>name</i> option-argument. The string specified in             |

|       |                        |                                                                                                          |
|-------|------------------------|----------------------------------------------------------------------------------------------------------|
| 31759 |                        | the <i>name</i> option-argument shall be passed, uninterpreted, to the server. This allows               |
| 31760 |                        | an implementation to match “wildcard” patterns against batch job names.                                  |
| 31761 |                        | An implementation shall describe in the conformance document the format it                               |
| 31762 |                        | supports for matching against the <i>Job_Name</i> attribute.                                             |
| 31763 | <b>-p [op]priority</b> |                                                                                                          |
| 31764 |                        | Restrict selection to batch jobs of the specified priority or range of priorities.                       |
| 31765 |                        | The <i>qselect</i> utility shall select only batch jobs for which the value of the <i>Priority</i>       |
| 31766 |                        | attribute of the batch job relates to the value of the <i>priority</i> component of the                  |
| 31767 |                        | option-argument in the manner indicated by the value of the <i>op</i> component of the                   |
| 31768 |                        | option-argument.                                                                                         |
| 31769 |                        | If the <i>op</i> component of the option-argument is omitted, the <i>qselect</i> utility shall           |
| 31770 |                        | select batch jobs for which the value of the <i>Priority</i> attribute of the batch job is               |
| 31771 |                        | equal to the value of the <i>priority</i> component of the option-argument.                              |
| 31772 |                        | When comparing priority values, the <i>qselect</i> utility shall use the following                       |
| 31773 |                        | definitions for the <i>op</i> component of the option-argument:                                          |
| 31774 | .eq.                   | The value of the <i>Priority</i> attribute of the batch job equals the value of the                      |
| 31775 |                        | <i>priority</i> component of the option-argument.                                                        |
| 31776 | .ge.                   | The value of the <i>Priority</i> attribute of the batch job is greater than or equal                     |
| 31777 |                        | to the value of the <i>priority</i> component option-argument.                                           |
| 31778 | .gt.                   | The value of the <i>Priority</i> attribute of the batch job is greater than the value                    |
| 31779 |                        | of the <i>priority</i> component option-argument.                                                        |
| 31780 | .lt.                   | The value of the <i>Priority</i> attribute of the batch job is less than the value of                    |
| 31781 |                        | the <i>priority</i> component option-argument.                                                           |
| 31782 | .lte.                  | The value of the <i>Priority</i> attribute of the batch job is less than or equal to                     |
| 31783 |                        | the value of the <i>priority</i> component option-argument.                                              |
| 31784 | .ne.                   | The value of the <i>Priority</i> attribute of the batch job does not equal the value                     |
| 31785 |                        | of the <i>priority</i> component option-argument.                                                        |
| 31786 | <b>-q destination</b>  |                                                                                                          |
| 31787 |                        | Restrict selection to the specified batch queue or server, or both.                                      |
| 31788 |                        | The <i>qselect</i> utility shall select only batch jobs that are located at the destination              |
| 31789 |                        | indicated by the value of the <i>destination</i> option-argument.                                        |
| 31790 |                        | The destination defines a batch queue, a server, or a batch queue at a server.                           |
| 31791 |                        | The <i>qselect</i> utility shall accept an option-argument for the <b>-q</b> option that conforms        |
| 31792 |                        | to the syntax for a destination. If the <b>-q</b> option is not presented to the <i>qselect</i> utility, |
| 31793 |                        | the utility shall select batch jobs from all batch queues at the default batch server.                   |
| 31794 |                        | If the option-argument describes only a batch queue, the <i>qselect</i> utility shall select             |
| 31795 |                        | only batch jobs from the batch queue of the specified name at the default batch                          |
| 31796 |                        | server. The means by which <i>qselect</i> determines the default server is                               |
| 31797 |                        | implementation-dependent.                                                                                |
| 31798 |                        | If the option-argument describes only a batch server, the <i>qselect</i> utility shall select            |
| 31799 |                        | batch jobs from all the batch queues at that batch server.                                               |
| 31800 |                        | If the option-argument describes both a batch queue and a batch server, the <i>qselect</i>               |
| 31801 |                        | utility shall select only batch jobs from the specified batch queue at the specified                     |

|       |                     |                                                                                                        |  |
|-------|---------------------|--------------------------------------------------------------------------------------------------------|--|
| 31802 |                     | server.                                                                                                |  |
| 31803 | <b>-r y n</b>       | Restrict selection to batch jobs with the specified rerunability status.                               |  |
| 31804 |                     | The <i>qselect</i> utility shall select only batch jobs for which the value of the <i>Rerunable</i>    |  |
| 31805 |                     | attribute of the batch job matches the value of the option-argument.                                   |  |
| 31806 |                     | The <i>qselect</i> utility shall accept a value for the option-argument that consists of               |  |
| 31807 |                     | either the single character 'y' or the single character 'n'. The character 'y'                         |  |
| 31808 |                     | represents the value TRUE, and the character 'n' represents the value FALSE.                           |  |
| 31809 | <b>-s states</b>    | Restrict selection to batch jobs in the specified states.                                              |  |
| 31810 |                     | The <i>qselect</i> utility shall accept an option-argument that consists of any combination            |  |
| 31811 |                     | of the characters 'e', 'q', 'r', 'w', 'h', and 't'.                                                    |  |
| 31812 |                     | Conforming applications shall not repeat any character in the option-argument.                         |  |
| 31813 |                     | The <i>qselect</i> utility shall permit the repetition of characters in the option-argument,           |  |
| 31814 |                     | but shall not assign additional meaning to repeated characters.                                        |  |
| 31815 |                     | The <i>qselect</i> utility shall interpret the characters in the <i>states</i> option-argument as      |  |
| 31816 |                     | follows:                                                                                               |  |
| 31817 |                     | e Represents the EXITING state.                                                                        |  |
| 31818 |                     | q Represents the QUEUED state.                                                                         |  |
| 31819 |                     | r Represents the RUNNING state.                                                                        |  |
| 31820 |                     | t Represents the TRANSITING state.                                                                     |  |
| 31821 |                     | h Represents the HELD state.                                                                           |  |
| 31822 |                     | w Represents the WAITING state.                                                                        |  |
| 31823 |                     | For each character in the <i>states</i> option-argument, the <i>qselect</i> utility shall select batch |  |
| 31824 |                     | jobs in the corresponding state.                                                                       |  |
| 31825 | <b>-u user_list</b> | Restrict selection to batch jobs owned by the specified user names.                                    |  |
| 31826 |                     | The <i>qselect</i> utility shall select only the batch jobs of those users specified in the            |  |
| 31827 |                     | <i>user_list</i> option-argument.                                                                      |  |
| 31828 |                     | The <i>qselect</i> utility shall accept a <i>user_list</i> option-argument that conforms to the        |  |
| 31829 |                     | following syntax:                                                                                      |  |
| 31830 |                     | <i>username</i> [@ <i>host</i> ][, , <i>username</i> [@ <i>host</i> ], , ...]                          |  |
| 31831 |                     | The <i>qselect</i> utility shall accept only one user name that is missing a corresponding             |  |
| 31832 |                     | host name. The <i>qselect</i> utility shall accept only one user name per named host.                  |  |
| 31833 | <b>OPERANDS</b>     |                                                                                                        |  |
| 31834 |                     | None.                                                                                                  |  |
| 31835 | <b>STDIN</b>        |                                                                                                        |  |
| 31836 |                     | Not used.                                                                                              |  |
| 31837 | <b>INPUT FILES</b>  |                                                                                                        |  |
| 31838 |                     | None.                                                                                                  |  |

31839 **ENVIRONMENT VARIABLES**

31840 The following environment variables shall affect the execution of *qselect*:

31841 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 31842 If *LANG* is unset or null, the corresponding value from the implementation-  
 31843 dependent default locale shall be used. If any of the internationalization variables  
 31844 contains an invalid setting, the utility shall behave as if none of the variables had  
 31845 been defined.

31846 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 31847 internationalization variables.

31848 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 31849 characters (for example, single-byte as opposed to multi-byte characters in  
 31850 arguments).

31851 *LC\_MESSAGES*

31852 Determine the locale that should be used to affect the format and contents of  
 31853 diagnostic messages written to standard error.

31854 *LC\_TIME* Determine the format and contents of date and time strings written by *qselect*.

31855 *LOGNAME* Determine the login name of the user.

31856 *TZ* Determine the timezone in which the time and date are written. If the *TZ* variable  
 31857 is not set, an unspecified system default timezone is used.

31858 **ASYNCHRONOUS EVENTS**

31859 Default.

31860 **STDOUT**

31861 The *qselect* utility shall write zero or more batch *job\_identifiers* to standard output.

31862 The *qselect* utility shall separate the batch *job\_identifiers* written to standard output by white  
 31863 space.

31864 The *qselect* utility shall write batch *job\_identifiers* in the following format:

31865 *sequence\_number.server\_name@server*

31866 **STDERR**

31867 Used only for diagnostic messages.

31868 **OUTPUT FILES**

31869 None.

31870 **EXTENDED DESCRIPTION**

31871 None.

31872 **EXIT STATUS**

31873 The following exit values shall be returned:

31874 0 Successful completion.

31875 >0 An error occurred.

31876 **CONSEQUENCES OF ERRORS**

31877 Default.

## 31878 APPLICATION USAGE

31879 None.

## 31880 EXAMPLES

31881 The following example shows how a user might use the *qselect* utility in conjunction with the  
 31882 *qdel* utility to delete all of his or her jobs in the queued state without affecting any jobs that are  
 31883 already running:

31884 `qdel qselect -s q`

31885 or:

31886 `qselect -s q || xargs qdel`

## 31887 RATIONALE

31888 The *qselect* utility allows users to acquire a list of job identifiers that match user-specified  
 31889 selection criteria. The list of identifiers returned by the *qselect* utility conforms to the syntax of  
 31890 the batch job identifier list processed by a utility such as *qmove*, *qdel*, and *qrls*. The *qselect* utility is  
 31891 thus a powerful tool for causing another batch system utility to act upon a set of jobs that match  
 31892 a list of selection criteria.

31893 The options of the *qselect* utility let the user apply a number of useful filters for selecting jobs.  
 31894 Each option further restricts the selection of jobs. Many of the selection options allow the  
 31895 specification of a relational operator. The FORTRAN-like syntax of the operator—that is,  
 31896 ".lt.", was chosen rather than the C-like "<=" meta-characters.

31897 The *-a* option allows users to restrict the selected jobs to those that have been submitted (or  
 31898 altered) to wait until a particular time. The time period is determined by the argument of this  
 31899 option, which includes both a time and an operator—it is thus possible to select jobs waiting  
 31900 until a specific time, jobs waiting until after a certain time, or those waiting for a time before the  
 31901 specified time.

31902 The *-A* option allows users to restrict the selected jobs to those that have been submitted (or  
 31903 altered) to charge a particular account.

31904 The *-c* option allows users to restrict the selected jobs to those whose checkpointing interval  
 31905 falls within the specified range.

31906 The *-l* option allows users to select those jobs whose resource limits fall within the range  
 31907 indicated by the value of the option. For example, a user could select those jobs for which the  
 31908 CPU time limit is greater than two hours.

31909 The *-N* option allows users to select jobs by job name. For instance, all the parts of a task that  
 31910 have been divided in parallel jobs might be given the same name, and thus manipulated as a  
 31911 group by means of this option.

31912 The *-q* option allows users to select jobs in a specified queue.

31913 The *-r* option allows users to select only those jobs with a specified rerun criteria. For instance, a  
 31914 user might select only those jobs that can be rerun for use with the *qrerun* utility.

31915 The *-s* option allows users to select only those jobs that are in a certain state.

31916 The *-u* option allows users to select jobs that have been submitted to execute under a particular  
 31917 account.

31918 As with other batch utilities, implementors can extend the *qselect* utility using the *-W* option.

31919 The selection criteria provided by the options of the *qselect* utility allow users to select jobs based  
 31920 on all the appropriate attributes that can be assigned to jobs by the *qsub* utility. When  
 31921 implementors extend the *qsub* utility, or another utilities, using the *-W* option, they may likewise

- 31922 elect to extend the *qselect* utility to allow additional selection criteria.
- 31923 Historically, the *qselect* utility has not been a part of existing practice; it is an improvement that
- 31924 has been introduced in this volume of IEEE Std. 1003.1-200x.
- 31925 **FUTURE DIRECTIONS**
- 31926 None.

- 31930 Derived from IEEE Std. 1003.2d-1994.

31931 **NAME**

31932           qsig — signal batch jobs

31933 **SYNOPSIS**

31934 BE       qsig [-s *signal*] *job\_identifier* ...

31935

31936 **DESCRIPTION**

31937       To signal a batch job is to send a signal to the session leader of the batch job. A batch job is  
31938       signaled by sending a request to the batch server that manages the batch job. The *qsig* utility is a  
31939       user-accessible batch client that requests the signaling of a batch job.

31940       The *qsig* utility shall signal those batch jobs for which a batch *job\_identifier* is presented to the  
31941       utility. The *qsig* utility shall not signal any batch jobs whose batch *job\_identifiers* are not  
31942       presented to the utility.

31943       The *qsig* utility shall signal batch jobs in the order in which the corresponding batch  
31944       *job\_identifiers* are presented to the utility. If the *qsig* utility fails to process a batch *job\_identifier*  
31945       successfully, the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

31946       The *qsig* utility shall signal batch jobs by sending a *Signal Job Request* to the batch server that  
31947       manages the batch job.

31948       For each successfully processed batch *job\_identifier*, the *qsig* utility shall have received a  
31949       completion reply to each *Signal Job Request* sent to a batch server at the time the utility exits.

31950 **OPTIONS**

31951       The *qsig* utility shall conform to the System Interface Definitions volume of  
31952       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

31953       The following option shall be supported by the implementation:

31954       -s *signal*     Define the signal to be sent to the batch job.

31955       The *qsig* utility shall accept a *signal* option-argument that is either a symbolic  
31956       signal name or an unsigned integer signal number (see the POSIX.1-1990 standard,  
31957       Section 3.3.1.1). The *qsig* utility shall accept signal names for which the SIG prefix  
31958       has been omitted.

31959       If the *signal* option-argument is a signal name, the *qsig* utility shall send that name.

31960       If the *signal* option-argument is a number, the *qsig* utility shall send the signal  
31961       value represented by the number.

31962       If the -s option is not presented to the *qsig* utility, the utility shall send the signal  
31963       SIGTERM to each signaled batch job.

31964 **OPERANDS**

31965       The *qsig* utility shall accept one or more operands that conform to the syntax for a batch  
31966       *job\_identifier* (see Section 3.3.1 on page 156).

31967 **STDIN**

31968       Not used.

31969 **INPUT FILES**

31970       None.

31971 **ENVIRONMENT VARIABLES**

31972 The following environment variables shall affect the execution of *qsig*:

31973 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 31974 If *LANG* is unset or null, the corresponding value from the implementation-  
 31975 dependent default locale shall be used. If any of the internationalization variables  
 31976 contains an invalid setting, the utility shall behave as if none of the variables had  
 31977 been defined.

31978 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 31979 internationalization variables.

31980 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 31981 characters (for example, single-byte as opposed to multi-byte characters in  
 31982 arguments).

31983 *LC\_MESSAGES*  
 31984 Determine the locale that should be used to affect the format and contents of  
 31985 diagnostic messages written to standard error.

31986 *LC\_TIME* Determine the format and contents of date and time strings written by *qsig*.

31987 *LOGNAME* Determine the login name of the user.

31988 *TZ* Determine the timezone in which the time and date are written. If the *TZ* variable  
 31989 is not set, an unspecified system default timezone is used.

31990 **ASYNCHRONOUS EVENTS**

31991 Default.

31992 **STDOUT**

31993 An implementation of the *qsig* utility may write informative messages to standard output.

31994 **STDERR**

31995 Used only for diagnostic messages.

31996 **OUTPUT FILES**

31997 None.

31998 **EXTENDED DESCRIPTION**

31999 None.

32000 **EXIT STATUS**

32001 The following exit values shall be returned:

32002 0 Successful completion.

32003 >0 An error occurred.

32004 **CONSEQUENCES OF ERRORS**

32005 In addition to the default behavior, the *qsig* utility shall not be required to write a diagnostic  
 32006 message to standard error when the error reply received from a batch server indicates that the  
 32007 batch *job\_identifier* does not exist on the server. Whether or not the *qsig* utility waits to output the  
 32008 diagnostic message while attempting to locate the batch job on other servers is implementation-  
 32009 dependent.

32010 **APPLICATION USAGE**

32011 None.

32012 **EXAMPLES**

32013 None.

32014 **RATIONALE**32015 The *qsig* utility allows users to signal batch jobs.

32016 A user may be unable to signal a batch job with the *kill* utility of the operating system for a  
32017 number of reasons. First, the process ID of the batch job may be unknown to the user. Second,  
32018 the processes of the batch job may be on a remote node. However, by virtue of communication  
32019 between batch nodes, the *qsig* utility can arrange for the signaling of a process.

32020 Because a batch job that is not running cannot be signaled, and because the signal may not  
32021 terminate the batch job, the *qsig* utility is not a substitute for the *qdel* utility.

32022 The options of the *qsig* utility allow the user to specify the signal that is to be sent to the batch  
32023 job.

32024 The *-s* option allows users to specify a signal by name or by number, and thus override the  
32025 default signal. The POSIX.1-1990 standard defines signals by both name and number.

32026 As with other batch utilities, implementors can extend the *qsig* utility using the *-W* option.

32027 The *qsig* utility is a new utility, *vis-a-vis* existing practice; it has been defined in this volume of  
32028 IEEE Std. 1003.1-200x in response to user-perceived shortcomings in existing practice.

32029 **FUTURE DIRECTIONS**

32030 None.

32031 **SEE ALSO**32032 *kill*, *qdel*, Chapter 3 on page 13332033 **CHANGE HISTORY**

32034 Derived from IEEE Std. 1003.2d-1994.

32035 **NAME**

32036 qstat — show status of batch jobs

32037 **SYNOPSIS**32038 BE qstat [-f] *job\_identifier* ...32039 qstat -Q [-f] *destination* ...32040 qstat -B [-f] *server\_name* ...

32041

32042 **DESCRIPTION**

32043 The status of a batch job, batch queue, or batch server is obtained by a request to the server. The  
 32044 *qstat* utility is a user-accessible batch client that requests the status of one or more batch jobs,  
 32045 batch queues, or servers, and writes the status information to standard output.

32046 For each successfully processed batch *job\_identifier*, the *qstat* utility shall display information  
 32047 about the corresponding batch job.

32048 For each successfully processed destination, the *qstat* utility shall display information about the  
 32049 corresponding batch queue.

32050 For each successfully processed server name, the *qstat* utility shall display information about the  
 32051 corresponding server.

32052 The *qstat* utility shall acquire batch job status information by sending a *Job Status Request* to a  
 32053 batch server. The *qstat* utility shall acquire batch queue status information by sending a *Queue*  
 32054 *Status Request* to a batch server. The *qstat* utility shall acquire server status information by  
 32055 sending a *Server Status Request* to a batch server.

32056 **OPTIONS**

32057 The *qstat* utility shall conform to the System Interface Definitions volume of  
 32058 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

32059 The following options shall be supported by the implementation:

32060 **-f** Specify that a full display is produced.

32061 The minimum contents of a full display are specified in the STDOUT section.

32062 Additional contents and format of a full display are implementation-dependent.

32063 **-Q** Specify that the operand is a destination.

32064 The *qstat* utility shall display information about each batch queue at each  
 32065 destination identified as an operand.

32066 **-B** Specify that the operand is a server name.

32067 The *qstat* utility shall display information about each server identified as an  
 32068 operand.

32069 **OPERANDS**

32070 If the **-Q** option is presented to the *qstat* utility, the utility shall accept one or more operands that  
 32071 conform to the syntax for a destination (see Section 3.3.2 on page 157).

32072 If the **-B** option is presented to the *qstat* utility, the utility shall accept one or more *server\_name*  
 32073 operands.

32074 If neither the **-B** nor the **-Q** option is presented to the *qstat* utility, the utility shall accept one or  
 32075 more operands that conform to the syntax for a batch *job\_identifier* (see Section 3.3.1 on page  
 32076 156).

32077 **STDIN**

32078 Not used.

32079 **INPUT FILES**

32080 None.

32081 **ENVIRONMENT VARIABLES**32082 The following environment variables shall affect the execution of *qstat*:

32083 *COLUMNS* Override the system-selected horizontal screen size. See the System Interface  
 32084 Definitions volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables for  
 32085 valid values and results when it is unset or null.

32086 *HOME* Determine the path name of the user's home directory.

32087 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 32088 If *LANG* is unset or null, the corresponding value from the implementation-  
 32089 dependent default locale shall be used. If any of the internationalization variables  
 32090 contains an invalid setting, the utility shall behave as if none of the variables had  
 32091 been defined.

32092 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 32093 internationalization variables.

32094 *LC\_COLLATE*

32095 Determine the locale for the behavior of ranges, equivalence classes and multi-  
 32096 character collating elements within regular expressions.

32097 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 32098 characters (for example, single-byte as opposed to multi-byte characters in  
 32099 arguments).

32100 *LC\_MESSAGES*

32101 Determine the locale that should be used to affect the format and contents of  
 32102 diagnostic messages written to standard error.

32103 *LC\_NUMERIC*

32104 Determine the locale for selecting the radix character used when writing floating-  
 32105 point formatted output.

32106 *LC\_TIME* Determine the format and contents of date and time strings written by *qstat*.

32107 *LINES* Override the system-selected vertical screen size, used as the number of lines in a  
 32108 screenful and the vertical screen size in visual mode. See the System Interface  
 32109 Definitions volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables for  
 32110 valid values and results when it is unset or null.

32111 *LOGNAME* Determine the login name of the user.

32112 *TERM* Determine the terminal type. If this variable is unset or null, and if the *-T* option is  
 32113 not specified, an unspecified default terminal type shall be used.

32114 *TZ* Determine the timezone in which the time and date are written. If the *TZ* variable  
 32115 is not set, an unspecified system default timezone is used.

32116 **ASYNCHRONOUS EVENTS**

32117 Default.

32118 **STDOUT**

32119 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the *-f* option is not  
 32120 specified, the *qstat* utility shall display the following items on a single line, in the stated order,  
 32121 with white space between each item, for each successfully processed operand:

- 32122 • The batch *job\_identifier*
- 32123 • The batch job name
- 32124 • The *Job\_Owner* attribute
- 32125 • The CPU time used by the batch job
- 32126 • The batch job state
- 32127 • The batch job location

32128 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the *-f* option is specified,  
 32129 the *qstat* utility shall display the following items for each success fully processed operand:

- 32130 • The batch *job\_identifier*
- 32131 • The batch job name
- 32132 • The *Job\_Owner* attribute
- 32133 • The execution user ID
- 32134 • The CPU time used by the batch job
- 32135 • The batch job state
- 32136 • The batch job location
- 32137 • Additional implementation-dependent information, if any, about the batch job or batch  
 32138 queue

32139 If an operand presented to the *qstat* utility is a destination, the *-Q* option is specified, and the *-f*  
 32140 option is not specified, the *qstat* utility shall display the following items on a single line, in the  
 32141 stated order, with white space between each item, for each successfully processed operand:

- 32142 • The batch queue name
- 32143 • The maximum number of batch jobs that are allowed to run in the batch queue concurrently
- 32144 • The total number of batch jobs in the batch queue
- 32145 • The status of the batch queue
- 32146 • For each state, the number of batch jobs in that state in the batch queue and the name of the  
 32147 state
- 32148 • The type of batch queue (execution or routing)

32149 If the operands presented to the *qstat* utility are destinations, the *-Q* option is specified, and the  
 32150 *-f* option is specified, the *qstat* utility shall display the following items for each successfully  
 32151 processed operand:

- 32152 • The batch queue name
- 32153 • The maximum number of batch jobs that are allowed to run in the batch queue concurrently
- 32154 • The total number of batch jobs in the batch queue
- 32155 • The status of the batch queue

|       |                                                                                                                    |  |
|-------|--------------------------------------------------------------------------------------------------------------------|--|
| 32156 | • For each state, the number of batch jobs in that state in the batch queue and the name of the                    |  |
| 32157 | state                                                                                                              |  |
| 32158 | • The type of batch queue (execution or routing)                                                                   |  |
| 32159 | • Additional implementation-dependent information, if any, about the batch queue                                   |  |
| 32160 | If the operands presented to the <i>qstat</i> utility are batch server names, the <b>-B</b> option is specified,   |  |
| 32161 | and the <b>-f</b> option is not specified, the <i>qstat</i> utility shall display the following items on a single  |  |
| 32162 | line, in the stated order, with white space between each item, for each successfully processed                     |  |
| 32163 | operand:                                                                                                           |  |
| 32164 | • The batch server name                                                                                            |  |
| 32165 | • The maximum number of batch jobs that are allowed to run in the batch queue concurrently                         |  |
| 32166 | • The total number of batch jobs managed by the batch server                                                       |  |
| 32167 | • The status of the batch server                                                                                   |  |
| 32168 | • For each state, the number of batch jobs in that state and the name of the state                                 |  |
| 32169 | If the operands presented to the <i>qstat</i> utility are server names, the <b>-B</b> option is specified, and the |  |
| 32170 | <b>-f</b> option is specified, the <i>qstat</i> utility shall display the following items for each successfully    |  |
| 32171 | processed operand:                                                                                                 |  |
| 32172 | • The server name                                                                                                  |  |
| 32173 | • The maximum number of batch jobs that are allowed to run in the batch queue concurrently                         |  |
| 32174 | • The total number of batch jobs managed by the server                                                             |  |
| 32175 | • The status of the server                                                                                         |  |
| 32176 | • For each state, the number of batch jobs in that state and the name of the state                                 |  |
| 32177 | • Additional implementation-dependent information, if any, about the server                                        |  |
| 32178 | <b>STDERR</b>                                                                                                      |  |
| 32179 | Used only for diagnostic messages.                                                                                 |  |
| 32180 | <b>OUTPUT FILES</b>                                                                                                |  |
| 32181 | None.                                                                                                              |  |
| 32182 | <b>EXTENDED DESCRIPTION</b>                                                                                        |  |
| 32183 | None.                                                                                                              |  |
| 32184 | <b>EXIT STATUS</b>                                                                                                 |  |
| 32185 | The following exit values shall be returned:                                                                       |  |
| 32186 | 0 Successful completion.                                                                                           |  |
| 32187 | >0 An error occurred.                                                                                              |  |
| 32188 | <b>CONSEQUENCES OF ERRORS</b>                                                                                      |  |
| 32189 | In addition to the default behavior, the <i>qstat</i> utility shall not be required to write a diagnostic          |  |
| 32190 | message to standard error when the error reply received from a batch server indicates that the                     |  |
| 32191 | batch <i>job_identifier</i> does not exist on the server. Whether or not the <i>qstat</i> utility waits to output  |  |
| 32192 | the diagnostic message while attempting to locate the batch job on other servers is                                |  |
| 32193 | implementation-dependent.                                                                                          |  |

**32194 APPLICATION USAGE**

32195 None.

**32196 EXAMPLES**

32197 None.

**32198 RATIONALE**

32199 The *qstat* utility allows users to display the status of jobs and listing the batch jobs in queues.

32200 The operands of the *qstat* utility may be either job identifiers, queues (specified as destination  
32201 identifiers), or batch server names. The **-Q** and **-B** options, or absence thereof, indicate the  
32202 nature of the operands.

32203 The other options of the *qstat* utility allow the user to control the amount of information  
32204 displayed and the format in which it is displayed. Should a user wish to display the status of a  
32205 set of jobs that match a selection criteria, the *qselect* utility may be used to acquire such a list.

32206 The **-f** option allows users to request a “full” display in an implementation-dependent format.

32207 As with other batch utilities, implementors may extend the *qstat* utility using the **-W** option.

32208 Historically, the *qstat* utility has been a part of the NQS and its derivatives, the existing practice  
32209 on which it is based.

**32210 FUTURE DIRECTIONS**

32211 None.

32213 *qselect*, Chapter 3 on page 133

**32214 CHANGE HISTORY**

32215 Derived from IEEE Std. 1003.2d-1994.

## 32216 NAME

32217            qsub — submit a script

## 32218 SYNOPSIS

```
32219 BE qsub [-a date_time][-A account_string][-c interval]
32220 [-C directive_prefix][-e path_name][-h][-j join_list][-k keep_list]
32221 [-l resource_list][-m mail_options][-M mail_list][-N name]
32222 [-o path_name][-p priority][-q destination][-r y|n]
32223 [-S path_name_list][-u user_list][-v variable_list][-V]
32224 [-z][script]
32225
```

### 32226 DESCRIPTION

To submit a script is to create a batch job that executes the script. A script is submitted by a request to a batch server. The *qsub* utility is a user-accessible batch client that submits a script.

32229 Upon successful completion, the *qsub* utility shall have created a batch job that will execute the  
32230 submitted script.

32231 The *qsub* utility shall submit a script by sending a *Queue Job Request* to a batch server.

32232 The *qsub* utility shall place the value of the following environment variables in the *Variable\_List*  
32233 attribute of the batch job: *HOME*, *LANG*, *LOGNAME*, *PATH*, *MAIL*, *SHELL*, and *TZ*. The name  
32234 of the environment variable shall be the current name prefixed with the string *PBS\_O\_*.

32235       **Note:**     If the current value of the *HOME* variable in the environment space of the *qsub* utility  
32236                   is */aa/bb/cc*, then *qsub* shall place *PBS\_O\_HOME=/aa/bb/cc* in the *Variable\_List*  
32237                   attribute of the batch job.

32238 In addition to the variables described above, the *qsub* utility shall add the following variables  
32239 with the indicated values to the variable list:

32240 *PBS\_O\_WORKDIR* The absolute path of the current working directory of the *qsub* utility process.

|       |                         |                                                                   |
|-------|-------------------------|-------------------------------------------------------------------|
| 32241 | <code>PBS_O_HOST</code> | The name of the host on which the <i>qsub</i> utility is running. |
|-------|-------------------------|-------------------------------------------------------------------|

## 32242 OPTIONS

32243 The *qsub* utility shall conform to the System Interface Definitions volume of  
32244 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

32245 The following options shall be supported by the implementation:

32246        **-a *date\_time*** Define the time at which a batch job becomes eligible for execution.

32247 The *qsub* utility shall accept an option-argument that conforms to the syntax of the  
32248 *date\_time* operand of the *touch* utility.

32249 **Table 4-18** Environment Variable Values (Utilities)

32250

| Variable Name        | Value at qsub Time        |
|----------------------|---------------------------|
| <i>PBS_O_HOME</i>    | <i>HOME</i>               |
| <i>PBS_O_HOST</i>    | Client host name          |
| <i>PBS_O_LANG</i>    | <i>LANG</i>               |
| <i>PBS_O_LOGNAME</i> | <i>LOGNAME</i>            |
| <i>PBS_O_PATH</i>    | <i>PATH</i>               |
| <i>PBS_O_MAIL</i>    | <i>MAIL</i>               |
| <i>PBS_O_SHELL</i>   | <i>SHELL</i>              |
| <i>PBS_O_TZ</i>      | <i>TZ</i>                 |
| <i>PBS_O_WORKDIR</i> | Current working directory |

32261  
32262  
32263

**Note:** The server that initiates execution of the batch job will add other variables to the batch job's environment; see Section 3.2.2.1 on page 139.

32264  
32265  
32266  
32267

The *qsub* utility shall set the *Execution\_Time* attribute of the batch job to the number of seconds since the Epoch that is equivalent to the local time expressed by the value of the *date\_time* option-argument. The Epoch is defined in the System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 3.151, Epoch.

32268  
32269  
32270

If the *-a* option is not presented to the *qsub* utility, the utility shall set the *Execution\_Time* attribute of the batch job to a time (number of seconds since the Epoch) that is earlier than the time at which the utility exits.

32271  
32272  
32273

**-A *account\_string***

Define the account to which the resource consumption of the batch job should be charged.

32274

The syntax of the *account\_string* option-argument is unspecified.

32275  
32276

The *qsub* utility shall set the *Account\_Name* attribute of the batch job to the value of the *account\_string* option-argument.

32277  
32278

If the *-A* option is not presented to the *qsub* utility, the utility shall omit the *Account\_Name* attribute from the attributes of the batch job.

32279 **-c *interval***

Define whether the batch job should be checkpointed, and if so, how often.

32280  
32281

The *qsub* utility shall accept a value for the interval option-argument that is one of the following:

32282  
32283

*n* No checkpointing shall be performed on the batch batch job (NO\_CHECKPOINT).

32284  
32285

*s* Checkpointing shall be performed only when the batch server is shut down (CHECKPOINT\_AT\_SHUTDOWN).

32286  
32287  
32288

*c* Automatic periodic checkpointing shall be performed at the *Minimum\_Cpu\_Interval* attribute of the batch queue, in units of CPU minutes (CHECKPOINT\_AT\_MIN\_CPU\_INTERVAL).

32289  
32290  
32291  
32292

*c=minutes* Automatic periodic checkpointing shall be performed every minutes of CPU time, or every *Minimum\_Cpu\_Interval* minutes, whichever is greater. The *minutes* argument shall conform to the syntax for unsigned integers and shall be greater than zero.

32293  
32294

The *qsub* utility shall set the *Checkpoint* attribute of the batch job to the value of the *interval* option-argument.

|       |                                  |                                                                                                                     |
|-------|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| 32295 |                                  | If the <code>-c</code> option is not presented to the <i>qsub</i> utility, the utility shall set the                |
| 32296 |                                  | <i>Checkpoint</i> attribute of the batch job to the single character 'u'                                            |
| 32297 |                                  | (CHECKPOINT_UNSPECIFIED).                                                                                           |
| 32298 | <code>-C directive_prefix</code> |                                                                                                                     |
| 32299 |                                  | Define the prefix that declares a directive to the <i>qsub</i> utility within the script.                           |
| 32300 |                                  | The <i>directive_prefix</i> is not a batch job attribute; it affects the behavior of the <i>qsub</i>                |
| 32301 |                                  | utility.                                                                                                            |
| 32302 |                                  | If the <code>-C</code> option is presented to the <i>qsub</i> utility, and the value of the <i>directive_prefix</i> |
| 32303 |                                  | option-argument is the null string, the utility shall not scan the script file for                                  |
| 32304 |                                  | directives. If the <code>-C</code> option is not presented to the <i>qsub</i> utility, then the value of the        |
| 32305 |                                  | <i>PBS_DPREFIX</i> environment variable is used. If the environment variable is not                                 |
| 32306 |                                  | defined, then #PBS encoded in the portable character set is the default.                                            |
| 32307 | <code>-e path_name</code>        | Define the path to be used for the standard error stream of the batch job.                                          |
| 32308 |                                  | The <i>qsub</i> utility shall accept a <i>path_name</i> option-argument that conforms to the                        |
| 32309 |                                  | syntax of the <i>path_name</i> element defined in the POSIX.1-1990 standard, which can                              |
| 32310 |                                  | be preceded by a host name element of the form <i>hostname</i> :                                                    |
| 32311 |                                  | If the <i>path_name</i> option-argument constitutes an absolute path name, the <i>qsub</i>                          |
| 32312 |                                  | utility shall set the <i>Error_Path</i> attribute of the batch job to the value of the                              |
| 32313 |                                  | <i>path_name</i> option-argument.                                                                                   |
| 32314 |                                  | If the <i>path_name</i> option-argument constitutes a relative path name and no host                                |
| 32315 |                                  | name element is specified, the <i>qsub</i> utility shall set the <i>Error_Path</i> attribute of the                 |
| 32316 |                                  | batch job to the value of the absolute path name derived by expanding the                                           |
| 32317 |                                  | <i>path_name</i> option-argument relative to the current directory of the process                                   |
| 32318 |                                  | executing <i>qsub</i> .                                                                                             |
| 32319 |                                  | If the <i>path_name</i> option-argument constitutes a relative path name and a host name                            |
| 32320 |                                  | element is specified, the <i>qsub</i> utility shall set the <i>Error_Path</i> attribute of the batch                |
| 32321 |                                  | job to the value of the <i>path_name</i> option-argument without expansion. The host                                |
| 32322 |                                  | name element shall be included.                                                                                     |
| 32323 |                                  | If the <i>path_name</i> option-argument does not include a host name element, the <i>qsub</i>                       |
| 32324 |                                  | utility shall prefix the path name with <i>hostname</i> ., where <i>hostname</i> is the name of the                 |
| 32325 |                                  | host upon which the <i>qsub</i> utility is being executed.                                                          |
| 32326 |                                  | If the <code>-e</code> option is not presented to the <i>qsub</i> utility, the utility shall set the                |
| 32327 |                                  | <i>Error_Path</i> attribute of the batch job to the host name and path of the current                               |
| 32328 |                                  | directory of the submitting process and the default file name.                                                      |
| 32329 |                                  | The default file name for standard error has the following format:                                                  |
| 32330 |                                  | <i>job_name.e</i> <i>sequence_number</i>                                                                            |
| 32331 | <code>-h</code>                  | Specify that a USER hold is applied to the batch job.                                                               |
| 32332 |                                  | The <i>qsub</i> utility shall set the value of the <i>Hold_Types</i> attribute of the batch job to the              |
| 32333 |                                  | value USER.                                                                                                         |
| 32334 |                                  | If the <code>-h</code> option is not presented to the <i>qsub</i> utility, the utility shall set the                |
| 32335 |                                  | <i>Hold_Types</i> attribute of the batch job to the value NO_HOLD.                                                  |
| 32336 | <code>-j join_list</code>        | Define which streams of the batch job are to be merged. The <i>qsub -j</i> option shall                             |
| 32337 |                                  | accept a value for the <i>join_list</i> option-argument that is a string of alphanumeric                            |
| 32338 |                                  | characters in the portable character set (see the System Interface Definitions                                      |

|       |                     |                                                                                                           |
|-------|---------------------|-----------------------------------------------------------------------------------------------------------|
| 32339 |                     | volume of IEEE Std. 1003.1-200x, Section 6.1, Portable Character Set).                                    |
| 32340 |                     | The <i>qsub</i> utility shall accept a <i>join_list</i> option-argument that consists of one or           |
| 32341 |                     | more of the characters 'e' and 'o' or the single character 'n'.                                           |
| 32342 |                     | All of the other batch job output streams specified will be merged into the output                        |
| 32343 |                     | stream represented by the character listed first in the <i>join_list</i> option-argument.                 |
| 32344 |                     | For each unique character in the <i>join_list</i> option-argument, the <i>qsub</i> utility shall          |
| 32345 |                     | add a value to the <i>Join_Path</i> attribute of the batch job as follows, each representing              |
| 32346 |                     | a different batch job stream to join:                                                                     |
| 32347 | <i>e</i>            | The standard error of the batch batch job (JOIN_STD_ERROR).                                               |
| 32348 | <i>o</i>            | The standard output of the batch batch job (JOIN_STD_OUTPUT).                                             |
| 32349 |                     | An existing <i>Join_Path</i> attribute can be cleared by the following join type:                         |
| 32350 | <b>n</b>            | NO_JOIN                                                                                                   |
| 32351 |                     | If <b>n</b> is specified, then no files are joined. The <i>qsub</i> utility shall consider it an error if |
| 32352 |                     | any join type other than <b>n</b> is combined with join type <b>n</b> .                                   |
| 32353 |                     | Strictly conforming applications shall not repeat any of the characters 'e', 'o', or                      |
| 32354 |                     | 'n' within the <i>join_list</i> option-argument. The <i>qsub</i> utility shall permit the                 |
| 32355 |                     | repetition of characters, but shall not assign additional meaning to the repeated                         |
| 32356 |                     | characters.                                                                                               |
| 32357 |                     | An implementation may define other join types. The conformance document for an                            |
| 32358 |                     | implementation shall describe any additional batch job streams, how they are                              |
| 32359 |                     | specified, their internal behavior, and how they affect the behavior of the utility.                      |
| 32360 |                     | If the <b>-j</b> option is not presented to the <i>qsub</i> utility, the utility shall set the value of   |
| 32361 |                     | the <i>Join_Path</i> attribute of the batch job to NO_JOIN.                                               |
| 32362 | <b>-k keep_list</b> | Define which output of the batch job to retain on the execution host.                                     |
| 32363 |                     | The <i>qsub</i> <b>-k</b> option shall accept a value for the <i>keep_list</i> option-argument that is a  |
| 32364 |                     | string of alphanumeric characters in the portable character set (see the System                           |
| 32365 |                     | Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable                              |
| 32366 |                     | Character Set).                                                                                           |
| 32367 |                     | The <i>qsub</i> utility shall accept a <i>keep_list</i> option-argument that consists of one or           |
| 32368 |                     | more of the characters 'e' and 'o' or the single character 'n'.                                           |
| 32369 |                     | For each unique character in the <i>keep_list</i> option-argument, the <i>qsub</i> utility shall          |
| 32370 |                     | add a value to the <i>Keep_Files</i> attribute of the batch job as follows, each representing             |
| 32371 |                     | a different batch job stream to keep:                                                                     |
| 32372 | <i>e</i>            | The standard error of the batch batch job (KEEP_STD_ERROR).                                               |
| 32373 | <i>o</i>            | The standard output of the batch batch job (KEEP_STD_OUTPUT).                                             |
| 32374 |                     | If both <i>e</i> and <i>o</i> are specified, then both files are retained. An existing <i>Keep_Files</i>  |
| 32375 |                     | attribute can be cleared by the following keep type:                                                      |
| 32376 | <b>n</b>            | NO_KEEP                                                                                                   |
| 32377 |                     | If <b>n</b> is specified, then no files are retained. The <i>qsub</i> utility shall consider it an error  |
| 32378 |                     | if any keep type other than <b>n</b> is combined with keep type <b>n</b> .                                |
| 32379 |                     | Strictly conforming applications shall not repeat any of the characters 'e', 'o', or                      |
| 32380 |                     | 'n' within the <i>keep_list</i> option-argument. The <i>qsub</i> utility shall permit the                 |

|       |                         |                                                                                                               |
|-------|-------------------------|---------------------------------------------------------------------------------------------------------------|
| 32381 |                         | repetition of characters, but shall not assign additional meaning to the repeated                             |
| 32382 |                         | characters.                                                                                                   |
| 32383 |                         | An implementation may define other keep types. The conformance document for                                   |
| 32384 |                         | an implementation shall describe any additional keep types, how they are                                      |
| 32385 |                         | specified, their internal behavior, and how they affect the behavior of the utility. If                       |
| 32386 |                         | the <b>-k</b> option is not presented to the <i>qsub</i> utility, the utility shall set the <i>Keep_Files</i> |
| 32387 |                         | attribute of the batch job to the value <b>NO_KEEP</b> .                                                      |
| 32388 | <b>-l resource_list</b> |                                                                                                               |
| 32389 |                         | Define the resources that are allowed or required by the batch job.                                           |
| 32390 |                         | The <i>qsub</i> utility shall accept a <i>resource_list</i> option-argument that conforms to the              |
| 32391 |                         | following syntax:                                                                                             |
| 32392 |                         | <i>resource=value[ , , resource=value, , ... ]</i>                                                            |
| 32393 |                         | For each resource listed in the <i>resource_list</i> option-argument, the <i>qsub</i> utility shall           |
| 32394 |                         | add one entry in the <i>Resource_List</i> attribute of the batch job, each such entry                         |
| 32395 |                         | containing the name of the resource and the value.                                                            |
| 32396 |                         | If the <b>-l</b> option is not presented to the <i>qsub</i> utility, the utility shall omit the               |
| 32397 |                         | <i>Resource_List</i> attribute from the attributes of the batch job. See Section 3.3.3 on page                |
| 32398 |                         | 157 for a means of removing <i>keyword=value</i> (and <i>value@keyword</i> ) pairs, and other                 |
| 32399 |                         | general rules for list-oriented batch job attributes.                                                         |
| 32400 | <b>Note:</b>            | See <REFERENCE UNDEFINED>(???)Table for a list of the reserved                                                |
| 32401 |                         | resource names.                                                                                               |
| 32402 | <b>-m mail_options</b>  |                                                                                                               |
| 32403 |                         | Define the points in the execution of the batch job at which the batch server that                            |
| 32404 |                         | manages the batch job shall send mail about a change in the state of the batch job.                           |
| 32405 |                         | The <i>qsub -m</i> option shall accept a value for the <i>mail_options</i> option-argument that               |
| 32406 |                         | is a string of alphanumeric characters in the portable character set (see the System                          |
| 32407 |                         | Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable                                  |
| 32408 |                         | Character Set).                                                                                               |
| 32409 |                         | The <i>qsub</i> utility shall accept a value for the <i>mail_options</i> option-argument that is a            |
| 32410 |                         | string of one or more of the characters 'e', 'b', and 'a', or the single character                            |
| 32411 |                         | 'n'.                                                                                                          |
| 32412 |                         | For each unique character in the <i>mail_options</i> option-argument, the <i>qsub</i> utility shall           |
| 32413 |                         | add a value to the <i>Mail_Users</i> attribute of the batch job as follows, each                              |
| 32414 |                         | representing a different time during the life of a batch job at which to send mail:                           |
| 32415 | <i>e</i>                | <b>MAIL_AT_EXIT</b>                                                                                           |
| 32416 | <i>b</i>                | <b>MAIL_AT_BEGINNING</b>                                                                                      |
| 32417 | <i>a</i>                | <b>MAIL_AT_ABORT</b>                                                                                          |
| 32418 |                         | If any of these characters are duplicated in the <i>mail_options</i> option-argument, the                     |
| 32419 |                         | duplicates shall be ignored.                                                                                  |
| 32420 |                         | An existing <i>Mail_Points</i> attribute can be cleared by the following mail type:                           |
| 32421 | <b>n</b>                | <b>NO_MAIL</b>                                                                                                |
| 32422 |                         | If <b>n</b> is specified, then mail is not sent. The <i>qsub</i> utility shall consider it an error if        |
| 32423 |                         | any mail type other than <b>n</b> is combined with mail type <b>n</b> .                                       |

|       |                     |                                                                                                        |
|-------|---------------------|--------------------------------------------------------------------------------------------------------|
| 32424 |                     | Strictly conforming applications shall not repeat any of the characters 'e', 'b',                      |
| 32425 |                     | 'a', or 'n' within the <i>mail_options</i> option-argument.                                            |
| 32426 |                     | The <i>qsub</i> utility shall permit the repetition of characters, but shall not assign                |
| 32427 |                     | additional meaning to the repeated characters. An implementation may define                            |
| 32428 |                     | other mail types. The conformance document for an implementation shall describe                        |
| 32429 |                     | any additional mail types, how they are specified, their internal behavior, and how                    |
| 32430 |                     | they affect the behavior of the utility.                                                               |
| 32431 |                     | If the <i>-m</i> option is not presented to the <i>qsub</i> utility, the utility shall set the         |
| 32432 |                     | <i>Mail_Points</i> attribute to the value MAIL_AT_ABORT.                                               |
| 32433 | <i>-M mail_list</i> | Define the list of users to which a batch server that executes the batch job shall                     |
| 32434 |                     | send mail, if the server sends mail about the batch job.                                               |
| 32435 |                     | The syntax of the <i>mail_list</i> option-argument is unspecified.                                     |
| 32436 |                     | If the implementation of the <i>qsub</i> utility uses a name service to locate users, the              |
| 32437 |                     | utility should accept the syntax used by the name service.                                             |
| 32438 |                     | If the implementation of the <i>qsub</i> utility does not use a name service to locate                 |
| 32439 |                     | users, the implementation should accept the following syntax for user names:                           |
| 32440 |                     | <i>mail_address</i> [ , , <i>mail_address</i> , , ... ]                                                |
| 32441 |                     | The interpretation of <i>mail_address</i> is implementation-dependent.                                 |
| 32442 |                     | The <i>qsub</i> utility shall set the <i>Mail_Users</i> attribute of the batch job to the value of the |
| 32443 |                     | <i>mail_list</i> option-argument.                                                                      |
| 32444 |                     | If the <i>-M</i> option is not presented to the <i>qsub</i> utility, the utility shall place only the  |
| 32445 |                     | user name and host name for the current process in the <i>Mail_Users</i> attribute of the              |
| 32446 |                     | batch job.                                                                                             |
| 32447 | <i>-N name</i>      | Define the name of the batch job.                                                                      |
| 32448 |                     | The <i>qsub</i> <i>-N</i> option shall accept a value for the <i>name</i> option-argument that is a    |
| 32449 |                     | string of up to 15 alphanumeric characters in the portable character set (see the                      |
| 32450 |                     | System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 6.1, Portable                    |
| 32451 |                     | Character Set) where the first character is alphabetic.                                                |
| 32452 |                     | The <i>qsub</i> utility shall set the value of the <i>Job_Name</i> attribute of the batch job to the   |
| 32453 |                     | value of the <i>name</i> option-argument.                                                              |
| 32454 |                     | If the <i>-N</i> option is not presented to the <i>qsub</i> utility, the utility shall set the         |
| 32455 |                     | <i>Job_Name</i> attribute of the batch job to the name of the <i>script</i> argument from which        |
| 32456 |                     | the directory specification if any, has been removed.                                                  |
| 32457 |                     | If the <i>-N</i> option is not presented to the <i>qsub</i> utility, and the script is read from       |
| 32458 |                     | standard input, the utility shall set the <i>Job_Name</i> attribute of the batch job to the            |
| 32459 |                     | value STDIN.                                                                                           |
| 32460 | <i>-o path_name</i> | Define the path for the standard output of the batch job.                                              |
| 32461 |                     | The <i>qsub</i> utility shall accept a <i>path_name</i> option-argument that conforms to the           |
| 32462 |                     | syntax of the <i>path_name</i> element defined in the POSIX.1-1990 standard, which can                 |
| 32463 |                     | be preceded by a host name element of the form <i>hostname</i> :                                       |
| 32464 |                     | If the <i>path_name</i> option-argument constitutes an absolute path name, the <i>qsub</i>             |
| 32465 |                     | utility shall set the <i>Output_Path</i> attribute of the batch job to the value of the                |
| 32466 |                     | <i>path_name</i> option-argument without expansion.                                                    |

|       |                       |                                                                                                                  |
|-------|-----------------------|------------------------------------------------------------------------------------------------------------------|
| 32467 |                       | If the <i>path_name</i> option-argument constitutes a relative path name and no host                             |
| 32468 |                       | name element is specified, the <i>qsub</i> utility shall set the <i>Output_Path</i> attribute of the             |
| 32469 |                       | batch job to the path name derived by expanding the value of the <i>path_name</i>                                |
| 32470 |                       | option-argument relative to the current directory of the process executing the <i>qsub</i> .                     |
| 32471 |                       | If the <i>path_name</i> option-argument constitutes a relative path name and a host name                         |
| 32472 |                       | element is specified, the <i>qsub</i> utility shall set the <i>Output_Path</i> attribute of the batch            |
| 32473 |                       | job to the value of the <i>path_name</i> option-argument without expansion.                                      |
| 32474 |                       | If the <i>path_name</i> option-argument does not specify a host name element, the <i>qsub</i>                    |
| 32475 |                       | utility shall prefix the path name with <i>hostname</i> ., where <i>hostname</i> is the name of the              |
| 32476 |                       | host upon which the <i>qsub</i> utility is executing.                                                            |
| 32477 |                       | If the <i>-o</i> option is not presented to the <i>qsub</i> utility, the utility shall set the                   |
| 32478 |                       | <i>Output_Path</i> attribute of the batch job to the host name and path of the current                           |
| 32479 |                       | directory of the submitting process and the default file name.                                                   |
| 32480 |                       | The default file name for standard output has the following format:                                              |
| 32481 |                       | <i>job_name.osequence_number</i>                                                                                 |
| 32482 | <i>-p priority</i>    | Define the priority the batch job should have relative to other batch jobs owned by                              |
| 32483 |                       | the batch server.                                                                                                |
| 32484 |                       | The <i>qsub</i> utility shall set the <i>Priority</i> attribute of the batch job to the value of the             |
| 32485 |                       | <i>priority</i> option-argument.                                                                                 |
| 32486 |                       | If the <i>-p</i> option is not presented to the <i>qsub</i> utility, the value of the <i>Priority</i>            |
| 32487 |                       | attribute is implementation-dependent.                                                                           |
| 32488 |                       | The <i>qsub</i> utility shall accept a value for the <i>priority</i> option-argument that conforms               |
| 32489 |                       | to the syntax for signed decimal integers, and which is not less than -1 024 and not                             |
| 32490 |                       | greater than 1 023.                                                                                              |
| 32491 | <i>-q destination</i> |                                                                                                                  |
| 32492 |                       | Define the destination of the batch job.                                                                         |
| 32493 |                       | The destination is not a batch job attribute; it determines the batch server, and                                |
| 32494 |                       | possibly the batch queue, to which the <i>qsub</i> utility batch queues the batch job.                           |
| 32495 |                       | The <i>qsub</i> utility shall submit the script to the batch server named by the <i>destination</i>              |
| 32496 |                       | option-argument or the server that owns the batch queue named in the <i>destination</i>                          |
| 32497 |                       | option-argument.                                                                                                 |
| 32498 |                       | The <i>qsub</i> utility shall accept an option-argument for the <i>-q</i> option that conforms to                |
| 32499 |                       | the syntax for a destination (see Section 3.3.2 on page 157).                                                    |
| 32500 |                       | If the <i>-q</i> option is not presented to the <i>qsub</i> utility, the <i>qsub</i> utility shall submit the    |
| 32501 |                       | batch job to the default destination. The mechanism for determining the default                                  |
| 32502 |                       | destination is implementation-dependent.                                                                         |
| 32503 | <i>-r y   n</i>       | Define whether the batch job is rerunnable.                                                                      |
| 32504 |                       | If the value of the option-argument is <i>yy</i> , the <i>qsub</i> utility shall set the <i>Rerunnable</i>       |
| 32505 |                       | attribute of the batch job to TRUE.                                                                              |
| 32506 |                       | If the value of the option-argument is <i>nn</i> , the <i>qsub</i> utility shall set the <i>Rerunnable</i>       |
| 32507 |                       | attribute of the batch job to FALSE.                                                                             |
| 32508 |                       | If the <i>-r</i> option is not presented to the <i>qsub</i> utility, the utility shall set the <i>Rerunnable</i> |
| 32509 |                       | attribute of the batch job to TRUE.                                                                              |

|       |                                 |                                                                                                                 |
|-------|---------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 32510 | <b>-S <i>path_name_list</i></b> |                                                                                                                 |
| 32511 |                                 | Define the path name to the shell under which the batch job is to execute.                                      |
| 32512 |                                 | The <i>qsub</i> utility shall accept a <i>path_name_list</i> option-argument that conforms to the               |
| 32513 |                                 | following syntax:                                                                                               |
| 32514 |                                 | <i>pathname</i> [@ <i>host</i> ][, , <i>pathname</i> [@ <i>host</i> ], , ...]                                   |
| 32515 |                                 | The <i>qsub</i> utility shall allow only one path name for a given host name. The <i>qsub</i>                   |
| 32516 |                                 | utility shall allow only one path name that is missing a corresponding host name.                               |
| 32517 |                                 | The <i>qsub</i> utility shall add a value to the <i>Shell_Path_List</i> attribute of the batch job for          |
| 32518 |                                 | each entry in the <i>path_name_list</i> option-argument.                                                        |
| 32519 |                                 | If the <b>-S</b> option is not presented to the <i>qsub</i> utility, the utility shall set the                  |
| 32520 |                                 | <i>Shell_Path_List</i> attribute of the batch job to the null string.                                           |
| 32521 |                                 | The conformance document for an implementation shall describe the mechanism                                     |
| 32522 |                                 | used to set the default shell and determine the current value of the default shell.                             |
| 32523 |                                 | An implementation shall provide a means for the installation to set the default                                 |
| 32524 |                                 | shell to the login shell of the user under which the batch job is to execute. See                               |
| 32525 |                                 | Section 3.3.3 on page 157 for a means of removing <i>keyword=value</i> (and                                     |
| 32526 |                                 | <i>value@keyword</i> ) pairs and other general rules for list-oriented batch job attributes.                    |
| 32527 | <b>-u <i>user_list</i></b>      | Define the user name under which the batch job is to execute.                                                   |
| 32528 |                                 | The <i>qsub</i> utility shall accept a <i>user_list</i> option-argument that conforms to the                    |
| 32529 |                                 | following syntax:                                                                                               |
| 32530 |                                 | <i>username</i> [@ <i>host</i> ][, , <i>username</i> [@ <i>host</i> ], , ...]                                   |
| 32531 |                                 | The <i>qsub</i> utility shall accept only one user name that is missing a corresponding                         |
| 32532 |                                 | host name. The <i>qsub</i> utility shall accept only one user name per named host.                              |
| 32533 |                                 | The <i>qsub</i> utility shall add a value to the <i>User_List</i> attribute of the batch job for each           |
| 32534 |                                 | entry in the <i>user_list</i> option-argument.                                                                  |
| 32535 |                                 | If the <b>-u</b> option is not presented to the <i>qsub</i> utility, the utility shall set the <i>User_List</i> |
| 32536 |                                 | attribute of the batch job to the user name from which the utility is executing. See                            |
| 32537 |                                 | Section 3.3.3 on page 157 for a means of removing <i>keyword=value</i> (and                                     |
| 32538 |                                 | <i>value@keyword</i> ) pairs and other general rules for list-oriented batch job attributes.                    |
| 32539 | <b>-v <i>variable_list</i></b>  |                                                                                                                 |
| 32540 |                                 | Add to the list of variables that are exported to the session leader of the batch job.                          |
| 32541 |                                 | A <i>variable_list</i> is a set of strings of either the form < <i>variable</i> > or < <i>variable=value</i> >, |
| 32542 |                                 | delimited by commas.                                                                                            |
| 32543 |                                 | If the <b>-v</b> option is presented to the <i>qsub</i> utility, the utility shall also add, to the             |
| 32544 |                                 | environment <i>Variable_List</i> attribute of the batch job, every variable named in the                        |
| 32545 |                                 | environment <i>variable_list</i> option-argument and, optionally, values of specified                           |
| 32546 |                                 | variables.                                                                                                      |
| 32547 |                                 | If a value is not provided on the command line, the <i>qsub</i> utility shall set the value                     |
| 32548 |                                 | of each variable in the environment <i>Variable_List</i> attribute of the batch job to the                      |
| 32549 |                                 | value of the corresponding environment variable for the process in which the                                    |
| 32550 |                                 | utility is executing; see Table 4-18 on page 840.                                                               |
| 32551 |                                 | A conforming application shall not repeat a variable in the environment                                         |
| 32552 |                                 | <i>variable_list</i> option-argument.                                                                           |

| 32624 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 32625 |                             | Lines are separated by a <newline>. If the first line of the script begins with "#!" or a colon (' : '), then it is skipped. The <i>qsub</i> utility shall process a line in the script as a directive if, and only if, the string of characters from the first non-white-space character on the line until the first <space> or <tab> character on the line match the directive prefix. If a line in the script contains a directive and the final characters of the line are backslash ( ' \ ' ) and <newline>, then the next line shall be interpreted as a continuation of that directive. |

| 32633 |                             | The <i>qsub</i> utility shall continue to process a directive prefix line until after a <newline> is encountered. An implementation may also ignore comments of the shell that will interpret the script. An implementation shall describe in the conformance document the format of any shell comments that it will recognize.                                                                                                                                                                                                                                                                |
| 32634 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 32635 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 32636 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

32637 If an option is present in both a directive and the arguments to the *qsub* utility, the utility shall  
 32638 ignore the option and the corresponding option-argument, if any, in the directive.

32639 If an option that is present in the directive is not present in the arguments to the *qsub* utility, the  
 32640 utility shall process the option and the option-argument, if any.

32641 In order of preference, the *qsub* utility shall select the directive prefix from one of the following  
 32642 sources:

- 32643 • If the **-C** option is presented to the utility, the value of the *directive\_prefix* option-argument
- 32644 • If the environment variable *PBS\_DPREFIX* is defined, the value of that variable
- 32645 • The four-character string "#PBS" encoded in the portable character set

32646 If the **-C** option is present in the script file it shall be ignored.

#### 32647 **EXIT STATUS**

32648 The following exit values shall be returned:

- 32649 0 Successful completion.
- 32650 >0 An error occurred.

#### 32651 **CONSEQUENCES OF ERRORS**

32652 Default.

#### 32653 **APPLICATION USAGE**

32654 None.

#### 32655 **EXAMPLES**

32656 None.

#### 32657 **RATIONALE**

32658 The *qsub* utility allows users to create a batch job that will process the script specified as the  
 32659 operand of the utility.

32660 The options of the *qsub* utility allow users to control many aspects of the queuing and execution  
 32661 of a batch job.

32662 The **-a** option allows users to designate the time after which the batch job will become eligible to  
 32663 run. By specifying an execution time, users can take advantage of resources at off-peak hours,  
 32664 synchronize jobs with chronologically predictable events, and perhaps take advantage of off-  
 32665 peak pricing of computing time. For these reasons and others, a timing option is existing practice  
 32666 on the part of almost every batch system, including NQS.

32667 The **-A** option allows users to specify the account that will be charged for the batch job. Support  
 32668 for account is not mandatory for conforming batch servers.

32669 The **-C** option allows users to prescribe the prefix for directives within the script file. The default  
 32670 prefix "#PBS" may be inappropriate if the script will be interpreted with an alternate shell, as  
 32671 specified by the **-S** option.

32672 The **-c** option allows users to establish the checkpointing interval for their jobs. A checkpointing  
 32673 system, which is not defined by this volume of IEEE Std. 1003.1-200x, allows recovery of a batch  
 32674 job at the most recent checkpoint in the event of a crash. Checkpointing is typically used for jobs  
 32675 that consume expensive computing time or must meet a critical schedule. Users should be  
 32676 allowed to make the tradeoff between the overhead of checkpointing and the risk to the timely  
 32677 completion of the batch job; therefore, this volume of IEEE Std. 1003.1-200x provides the  
 32678 checkpointing interval option. Support for checkpointing is optional for batch servers.

32679 The **-e** option allows users to redirect the standard error streams of their jobs to a non-default  
32680 path. For example, if the submitted script generally produces a great deal of useless error output,  
32681 a user might redirect the standard error output to the null device. Or, if the file system holding  
32682 the default location (the home directory of the user) has too little free space, the user might  
32683 redirect the standard error stream to a file in another file system.

32684 The **-h** option allows users to create a batch job that is held until explicitly released. The ability  
32685 to create a held job is useful when some external event must complete before the batch job can  
32686 execute. For example, the user might submit a held job and release it when the system load has  
32687 dropped.

32688 The **-j** option allows users to merge the standard error of a batch job into its standard output  
32689 stream, which has the advantage of showing the sequential relationship between output and  
32690 error messages.

32691 The **-l** option allows users to limit the resources that will be consumed by the batch job. For  
32692 example, the user may wish to limit the amount of CPU time that can be consumed by a batch  
32693 job that has a risk of entering an infinite loop.

32694 The **-m** option allows users to designate those points in the execution of a batch job at which  
32695 mail will be sent to the submitting user, or to the account(s) indicated by the **-M** option. By  
32696 requesting mail notification at points of interest in the life of a job, the submitting user, or other  
32697 designated users, can track the progress of a batch job.

32698 The **-N** option allows users to associate a name with the batch job. The job name in no way  
32699 affects the processing of the batch job, but rather serves as a mnemonic handle for users. For  
32700 example, the batch job name can help the user distinguish between multiple jobs listed by the  
32701 *qstat* utility.

32702 The **-o** option allows users to redirect the standard output stream. A user might, for example,  
32703 wish to redirect to the null device the standard output stream of a job that produces copious yet  
32704 superfluous output.

32705 The **-P** option allows users to designate the relative priority of a batch job for selection from a  
32706 queue.

32707 The **-q** option allows users to specify an initial queue for the batch job. If the user specifies a  
32708 routing queue, the batch batch server routes the batch job to another queue for execution or  
32709 further routing. If the user specifies a non-routing queue, the batch server of the queue  
32710 eventually executes the batch job.

32711 The **-r** option allows users to control whether the submitted job will be rerun if the controlling  
32712 batch node fails during execution of the batch job. The **-r** option likewise allows users to  
32713 indicate whether or not the batch job is eligible to be rerun by the *qrerun* utility. Some jobs cannot  
32714 be correctly rerun because of changes they make in the state of databases or other aspects of  
32715 their environment. This volume of IEEE Std. 1003.1-200x specifies that the default, if the **-r**  
32716 option is not presented to the utility, will be that the batch job cannot be rerun, since the result of  
32717 rerunning a non-rerunable job might be catastrophic.

32718 The **-S** option allows users to specify the program (usually a shell) that will be invoked to  
32719 process the script of the batch job. This option has been modified to allow a list of shell names  
32720 and locations associated with different hosts.

32721 The **-u** option is useful when the submitting user is authorized to use more than one account on  
32722 a given host, in which case the **-u** option allows the user to select from among those accounts.  
32723 The option-argument is a list of user-host pairs, so that the submitting user can provide different  
32724 user identifiers for different nodes in the event the batch job is routed. The **-u** option provides a  
32725 lot of flexibility to accommodate sites with complex account structures. Users that have the

|       |                                                                                                             |
|-------|-------------------------------------------------------------------------------------------------------------|
| 32726 | same user identifier on all the hosts they are authorized to use will not need to use the <b>-u</b> option. |
| 32727 | The <b>-V</b> option allows users to export all their current environment variables, as of the time the     |
| 32728 | batch job is submitted, to the context of the processes of the batch job.                                   |
| 32729 | The <b>-v</b> option allows users to export specific environment variables from their current process       |
| 32730 | to the processes of the batch job.                                                                          |
| 32731 | The <b>-z</b> option allows users to suppress the writing of the batch job identifier to standard output.   |
| 32732 | The <b>-z</b> option is an existing NQS practice that has been standardized.                                |
| 32733 | As with other batch utilities, implementors can extend the <i>qsub</i> utility using the <b>-W</b> option.  |
| 32734 | Historically, the <i>qsub</i> utility has served the batch job-submission function in the NQS system, the   |
| 32735 | existing practice on which it is based. Some changes and additions have been made to the <i>qsub</i>        |
| 32736 | utility in this volume of IEEE Std. 1003.1-200x, <i>vis-a-vis</i> NQS, as a result of the growing pool of   |
| 32737 | experience with distributed batch systems.                                                                  |
| 32738 | The set of features of the <i>qsub</i> utility as defined in this volume of IEEE Std. 1003.1-200x appears   |
| 32739 | to incorporate all the common existing practice on potentially POSIX-conformant platforms.                  |
| 32740 | Where implementors wish to extend the functionality of their <i>qsub</i> utility, they may (as defined      |
| 32741 | by the base standard) use the <b>-W</b> option to provide implementation-dependent extensions.              |
| 32742 | <b>FUTURE DIRECTIONS</b>                                                                                    |
| 32743 | None.                                                                                                       |
| 32744 | <b>SEE ALSO</b>                                                                                             |

| 32746 | <b>CHANGE HISTORY</b>                                                                                       |
| 32747 | Derived from IEEE Std. 1003.2d-1994.                                                                        |

32748 **NAME**32749        *read* — read a line from standard input32750 **SYNOPSIS**32751        *read* [-r] *var*...32752 **DESCRIPTION**32753        The *read* utility shall read a single line from standard input.

32754        By default, unless the **-r** option is specified, backslash ('\**'**) shall act as an escape character, as  
 32755        described in Section 2.2.1 on page 36. If standard input is a terminal device and the invoking  
 32756        shell is interactive, *read* shall prompt for a continuation line when:

- 32757        • The shell reads an input line ending with a backslash, unless the **-r** option is specified.
- 32758        • A here-document is not terminated after a <newline> character is entered.

32759        The line shall be split into fields as in the shell (see Section 2.6.5 on page 58); the first field shall  
 32760        be assigned to the first variable *var*, the second field to the second variable *var*, and so on. If  
 32761        there are fewer *var* operands specified than there are fields, the leftover fields and their  
 32762        intervening separators shall be assigned to the last *var*. If there are fewer fields than *vars*, the  
 32763        remaining *vars* shall be set to empty strings.

32764        The setting of variables specified by the *var* operands shall affect the current shell execution  
 32765        environment; see Section 2.12 on page 90. If it is called in a subshell or separate utility execution  
 32766        environment, such as one of the following:

```
32767 (read foo)
32768 nohup read ...
32769 find . -exec read ... \;
```

32770        it shall not affect the shell variables in the caller's environment.

32771 **OPTIONS**

32772        The *read* utility shall conform to the System Interface Definitions volume of  
 32773        IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

32774        The following option is supported:

32775        **-r**        Do not treat a backslash character in any special way. Consider each backslash to  
 32776        be part of the input line.

32777 **OPERANDS**

32778        The following operand shall be supported:

32779        *var*        The name of an existing or nonexisting shell variable.

32780 **STDIN**

32781        The standard input shall be a text file.

32782 **INPUT FILES**

32783        None.

32784 **ENVIRONMENT VARIABLES**32785        The following environment variables shall affect the execution of *read*:

32786        *IFS*        Determine the internal field separators used to delimit fields; see Section 2.5.3 on  
 32787        page 45.

32788        *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 32789        If *LANG* is unset or null, the corresponding value from the implementation-  
 32790        dependent default locale shall be used. If any of the internationalization variables

|       |                               |                                                                                                                        |
|-------|-------------------------------|------------------------------------------------------------------------------------------------------------------------|
| 32791 |                               | contains an invalid setting, the utility shall behave as if none of the variables had                                  |
| 32792 |                               | been defined.                                                                                                          |
| 32793 | <b>LC_ALL</b>                 | If set to a non-empty string value, override the values of all the other                                               |
| 32794 |                               | internationalization variables.                                                                                        |
| 32795 | <b>LC_CTYPE</b>               | Determine the locale for the interpretation of sequences of bytes of text data as                                      |
| 32796 |                               | characters (for example, single-byte as opposed to multi-byte characters in                                            |
| 32797 |                               | arguments).                                                                                                            |
| 32798 | <b>LC_MESSAGES</b>            |                                                                                                                        |
| 32799 |                               | Determine the locale that should be used to affect the format and contents of                                          |
| 32800 |                               | diagnostic messages written to standard error.                                                                         |
| 32801 | <b>XLSPATH</b>                | Determine the location of message catalogs for the processing of <b>LC_MESSAGES</b> .                                  |
| 32802 | <b>PS2</b>                    | Provide the prompt string that an interactive shell shall write to standard error                                      |
| 32803 |                               | when a line ending with a backslash is read and the <b>-r</b> option was not specified, or                             |
| 32804 |                               | if a here-document is not terminated after a <newline> character is entered.                                           |
| 32805 | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                        |
| 32806 |                               | Default.                                                                                                               |
| 32807 | <b>STDOUT</b>                 |                                                                                                                        |
| 32808 |                               | Not used.                                                                                                              |
| 32809 | <b>STDERR</b>                 |                                                                                                                        |
| 32810 |                               | Used for diagnostic messages and prompts for continued input.                                                          |
| 32811 | <b>OUTPUT FILES</b>           |                                                                                                                        |
| 32812 |                               | None.                                                                                                                  |
| 32813 | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                        |
| 32814 |                               | None.                                                                                                                  |
| 32815 | <b>EXIT STATUS</b>            |                                                                                                                        |
| 32816 |                               | The following exit values shall be returned:                                                                           |
| 32817 | 0                             | Successful completion.                                                                                                 |
| 32818 | >0                            | End-of-file was detected or an error occurred.                                                                         |
| 32819 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                        |
| 32820 |                               | Default.                                                                                                               |
| 32821 | <b>APPLICATION USAGE</b>      |                                                                                                                        |
| 32822 |                               | The <i>read</i> utility has historically been a shell built-in.                                                        |
| 32823 |                               | The <b>-r</b> option is included to enable <i>read</i> to subsume the purpose of the <i>line</i> utility, which is not |
| 32824 |                               | included in IEEE Std. 1003.1-200x.                                                                                     |
| 32825 |                               | The results are undefined if an end-of-file is detected following a backslash at the end of a line                     |
| 32826 |                               | when <b>-r</b> is not specified.                                                                                       |
| 32827 | <b>EXAMPLES</b>               |                                                                                                                        |
| 32828 |                               | The following command:                                                                                                 |
| 32829 |                               | while read -r xx yy                                                                                                    |
| 32830 |                               | do                                                                                                                     |
| 32831 |                               | printf "%s %s\n" "\$yy" "\$xx"                                                                                         |
| 32832 |                               | done < <i>input_file</i>                                                                                               |

32833            prints a file with the first field of each line moved to the end of the line.

32834 **RATIONALE**

32835            The *read* utility historically has been a shell built-in. It was separated off into its own utility to  
32836            take advantage of the richer description of functionality introduced by this volume of  
32837            IEEE Std. 1003.1-200x.

32838            Since *read* affects the current shell execution environment, it is generally provided as a shell  
32839            regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
32840            of the following:

```
32841 (read foo)
32842 nohup read ...
32843 find . -exec read ... \;
```

32844            it does not affect the shell variables in the environment of the caller.

32845 **FUTURE DIRECTIONS**

32846            None.

32847 **SEE ALSO**

32848            None.

32849 **CHANGE HISTORY**

32850            First released in Issue 2.

32851 **Issue 4**

32852            Relocated from the *sh* description for alignment with the ISO/IEC 9945-2: 1993 standard.

32853 **NAME**

32854           renice — set nice values of running processes

32855 **SYNOPSIS**32856 UP        renice -n *increment* [-g | -p | -u] *ID* ...

32857

32858 **DESCRIPTION**

32859       The *renice* utility shall request that the nice values (see the System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 3.245, Nice Value) of one or more running processes be changed. By default, the applicable processes are specified by their process IDs. When a process group is specified (see -g), the request applies to all processes in the process group.

32863       The nice value shall be bounded in an implementation-dependent manner. If the requested *increment* would raise or lower the nice value of the executed utility beyond implementation-dependent limits, then the limit whose value was exceeded shall be used.

32866       When a user is *reniced*, the request applies to all processes whose saved set-user-ID matches the user ID corresponding to the user.

32868       Regardless of which options are supplied or any other factor, *renice* shall not alter the nice values of any process unless the user requesting such a change has appropriate privileges to do so for the specified process. If the user lacks appropriate privileges to perform the requested action, the utility shall return an error status.

32872       The saved set-user-ID of the user's process shall be checked instead of its effective user ID when *renice* attempts to determine the user ID of the process in order to determine whether the user has appropriate privileges.

32875 **OPTIONS**

32876       The *renice* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

32878       The following options shall be supported:

32879        -g           Interpret all operands as unsigned decimal integer process group IDs.

32880        -n *increment* Specify how the nice value of the specified process or processes is to be adjusted. The *increment* option-argument is a positive or negative decimal integer that shall be used to modify the nice value of the specified process or processes.

32883                   Positive *increment* values shall cause a lower nice value. Negative *increment* values may require appropriate privileges and shall cause a higher nice value.

32885        -p           Interpret all operands as unsigned decimal integer process IDs. The -p option is the default if no options are specified.

32887        -u           Interpret all operands as users. If a user exists with a user name equal to the operand, then the user ID of that user is used in further processing. Otherwise, if the operand represents an unsigned decimal integer, it shall be used as the numeric user ID of the user.

32891 **OPERANDS**

32892       The following operands shall be supported:

32893        *ID*           A process ID, process group ID, or user name/user ID, depending on the option selected.

32894

32895 **STDIN**

32896 Not used.

32897 **INPUT FILES**

32898 None.

32899 **ENVIRONMENT VARIABLES**32900 The following environment variables shall affect the execution of *renice*:

32901 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 32902 If *LANG* is unset or null, the corresponding value from the implementation-  
 32903 dependent default locale shall be used. If any of the internationalization variables  
 32904 contains an invalid setting, the utility shall behave as if none of the variables had  
 32905 been defined.

32906 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 32907 internationalization variables.

32908 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 32909 characters (for example, single-byte as opposed to multi-byte characters in  
 32910 arguments).

32911 *LC\_MESSAGES*

32912 Determine the locale that should be used to affect the format and contents of  
 32913 diagnostic messages written to standard error.

32914 *XSI NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

32915 **ASYNCHRONOUS EVENTS**

32916 Default.

32917 **STDOUT**

32918 Not used.

32919 **STDERR**

32920 Used only for diagnostic messages.

32921 **OUTPUT FILES**

32922 None.

32923 **EXTENDED DESCRIPTION**

32924 None.

32925 **EXIT STATUS**

32926 The following exit values shall be returned:

32927 0 Successful completion.

32928 &gt;0 An error occurred.

32929 **CONSEQUENCES OF ERRORS**

32930 Default.

32931 **APPLICATION USAGE**

32932 Application writers should note that this utility need not be provided on systems that do not  
 32933 support the User Portability Utilities option.

32934 **EXAMPLES**

32935 1. Adjust the nice value so that process IDs 987 and 32 would have a lower nice value:

32936 `renice -n 5 -p 987 32`

32937 2. Adjust the nice value so that group IDs 324 and 76 would have a higher nice value, if the  
 32938 user has the appropriate privileges to do so:

32939 `renice -n -4 -g 324 76`

32940 3. Adjust the nice value so that numeric user ID 8 and user **sas** would have a lower nice  
 32941 value:

32942 `renice -n 4 -u 8 sas`

32943 Useful nice value increments on historical systems include 19 or 20 (the affected processes run  
 32944 only when nothing else in the system attempts to run) and any negative number (to make  
 32945 processes run faster).

32946 **RATIONALE**

32947 The *gid*, *pid*, and *user* specifications do not fit either the definition of operand or option-  
 32948 argument. However, for clarity, they have been included in the OPTIONS section, rather than  
 32949 the OPERANDS section.

32950 The definition of nice value is not intended to suggest that all processes in a system have  
 32951 priorities that are comparable. Scheduling policy extensions such as the realtime priorities in  
 32952 POSIX.4 make the notion of a single underlying priority for all scheduling policies problematic.  
 32953 Some systems may implement the *nice* **-related** features to affect all processes on the system,  
 32954 others to affect just the general time-sharing activities implied by this volume of  
 32955 IEEE Std. 1003.1-200x, and others may have no effect at all. Because of the use of  
 32956 “implementation-dependent” in *nice* and *renice*, a wide range of implementation strategies are  
 32957 possible.

32958 Originally, this utility was written in the historical manner, using the term “nice value”. This  
 32959 was always a point of concern with users because it was never intuitively obvious what this  
 32960 meant. With a newer version of *renice*, which used the term “system scheduling priority”, it was  
 32961 hoped that novice users could better understand what this utility was meant to do. Also, it  
 32962 would be easier to document what the utility was meant to do. Unfortunately, the addition of  
 32963 the POSIX realtime scheduling capabilities introduced the concepts of process and thread  
 32964 scheduling priorities that were totally unaffected by the *nice*/*renice* utilities or the  
 32965 *nice()*/*setpriority()* functions. Continuing to use the term “system scheduling priority” would  
 32966 have incorrectly suggested that these utilities and functions were indeed affecting these realtime  
 32967 priorities. It was decided to revert to the historical term “nice value” to reference this unrelated  
 32968 process attribute.

32969 Although this utility has use by system administrators (and in fact appears in the system  
 32970 administration portion of the BSD documentation), the standard developers considered that it  
 32971 was very useful for individual end users to control their own processes.

32972 **FUTURE DIRECTIONS**

32973 None.

32974 **SEE ALSO**32975 *nice*32976 **CHANGE HISTORY**

32977 First released in Issue 4.

32978 **Issue 5**32979 In the SYNOPSIS, an ellipsis is added to the **-u** option in all three obsolescent forms.32980 **Issue 6**

32981 This utility is now marked as part of the User Portability Utilities option.

32982 The APPLICATION USAGE section is added.

32983 The obsolescent forms of the SYNOPSIS are removed.

32984 Text previously conditional on POSIX\_SAVED\_IDS is mandatory in this issue. This is a FIPS  
32985 requirement.

## 32986 NAME

32987 rm — remove directory entries

## 32988 SYNOPSIS

32989 rm [-fiRr] *file*...

## 32990 DESCRIPTION

32991 The *rm* utility shall remove the directory entry specified by each *file* argument.

32992 If either of the files dot or dot-dot are specified as the basename portion of an operand (that is,  
 32993 the final path name component), *rm* shall write a diagnostic message to standard error and do  
 32994 nothing more with such operands.

32995 For each *file* the following steps shall be taken:

- 32996 1. If the *file* does not exist:
    - 32997 a. If the **-f** option is not specified, write a diagnostic message to standard error.
    - 32998 b. Go on to any remaining *files*.
  - 32999 2. If *file* is of type directory, the following steps shall be taken:
    - 33000 a. If neither the **-R** option nor the **-r** option is specified, write a diagnostic message to  
 33001 standard error, do nothing more with *file*, and go on to any remaining files.
    - 33002 b. If the **-f** option is not specified, and either the permissions of *file* do not permit  
 33003 writing and the standard input is a terminal or the **-i** option is specified, write a  
 33004 prompt to standard error and read a line from the standard input. If the response is  
 33005 not affirmative, do nothing more with the current file and go on to any remaining  
 33006 files.
    - 33007 c. For each entry contained in *file*, other than dot or dot-dot, the four steps listed here  
 33008 (1-4) shall be taken with the entry as if it were a *file* operand. The *rm* utility shall not  
 33009 traverse directories by following symbolic links into other parts of the hierarchy, but  
 33010 shall remove the links themselves.
    - 33011 d. If the **-i** option is specified, write a prompt to standard error and read a line from the  
 33012 standard input. If the response is not affirmative, do nothing more with the current  
 33013 file, and go on to any remaining files.
  - 33014 3. If *file* is not of type directory, the **-f** option is not specified, and either the permissions of  
 33015 *file* do not permit writing and the standard input is a terminal or the **-i** option is specified,  
 33016 write a prompt to the standard error and read a line from the standard input. If the  
 33017 response is not affirmative, do nothing more with the current file and go on to any  
 33018 remaining files.
  - 33019 4. If the current file is a directory, *rm* shall perform actions equivalent to the *rmdir()* function  
 33020 defined in the System Interfaces volume of IEEE Std. 1003.1-200x called with a path name  
 33021 of the current file used as the *path* argument. If the current file is not a directory, *rm* shall  
 33022 perform actions equivalent to the *unlink()* function defined in the System Interfaces  
 33023 volume of IEEE Std. 1003.1-200x called with a path name of the current file used as the *path*  
 33024 argument.
- 33025 If this fails for any reason, *rm* shall write a diagnostic message to standard error, do  
 33026 nothing more with the current file, and go on to any remaining files.

33027 The *rm* utility shall be able to descend to arbitrary depths in a file hierarchy, and shall not fail  
 33028 due to path length limitations (unless an operand specified by the user exceeds system  
 33029 limitations).

33030 **OPTIONS**

33031 The *rm* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 33032 Section 12.2, Utility Syntax Guidelines.

33033 The following options shall be supported:

33034 **-f** Do not prompt for confirmation. Do not write diagnostic messages or modify the  
 33035 exit status in the case of nonexistent operands. Any previous occurrences of the **-i**  
 33036 option shall be ignored.

33037 **-i** Prompt for confirmation as described previously. Any previous occurrences of the  
 33038 **-f** option shall be ignored.

33039 **-R** Remove file hierarchies. See the DESCRIPTION.

33040 **-r** Equivalent to **-R**.

33041 **OPERANDS**

33042 The following operand shall be supported:

33043 *file* A path name of a directory entry to be removed.

33044 **STDIN**

33045 Used to read an input line in response to each prompt specified in the STDOUT section.  
 33046 Otherwise, the standard input shall not be used.

33047 **INPUT FILES**

33048 None.

33049 **ENVIRONMENT VARIABLES**

33050 The following environment variables shall affect the execution of *rm*:

33051 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 33052 If **LANG** is unset or null, the corresponding value from the implementation-  
 33053 dependent default locale shall be used. If any of the internationalization variables  
 33054 contains an invalid setting, the utility shall behave as if none of the variables had  
 33055 been defined.

33056 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 33057 internationalization variables.

33058 **LC\_COLLATE**

33059 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 33060 character collating elements used in the extended regular expression defined for  
 33061 the **yesexpr** locale keyword in the **LC\_MESSAGES** category.

33062 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 33063 characters (for example, single-byte as opposed to multi-byte characters in  
 33064 arguments) and the behavior of character classes within regular expressions used  
 33065 in the extended regular expression defined for the **yesexpr** locale keyword in the  
 33066 **LC\_MESSAGES** category.

33067 **LC\_MESSAGES**

33068 Determine the locale for the processing of affirmative responses that should be  
 33069 used to affect the format and contents of diagnostic messages written to standard  
 33070 error.

33071 **XS1** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

33072 **ASYNCHRONOUS EVENTS**

33073 Default.

33074 **STDOUT**

33075 Not used.

33076 **STDERR**

33077 Prompts shall be written to standard error under the conditions specified in the DESCRIPTION  
 33078 and OPTIONS sections. The prompts shall contain the *file* path name, but their format is  
 33079 otherwise unspecified. The standard error also shall be used for diagnostic messages.

33080 **OUTPUT FILES**

33081 None.

33082 **EXTENDED DESCRIPTION**

33083 None.

33084 **EXIT STATUS**

33085 The following exit values shall be returned:

33086 0 All of the named directory entries for which *rm* performed actions equivalent to *rmdir()* or  
 33087 *unlink()* functions were removed.

33088 &gt;0 An error occurred.

33089 **CONSEQUENCES OF ERRORS**

33090 Default.

33091 **APPLICATION USAGE**

33092 The *rm* utility is forbidden to remove the names dot and dot-dot in order to avoid the  
 33093 consequences of inadvertently doing something like:

33094 `rm -r .*`

33095 Some systems do not permit the removal of the last link to an executable binary file that is being  
 33096 executed; see the [EBUSY] error in the *unlink()* function defined in the System Interfaces volume  
 33097 of IEEE Std. 1003.1-200x. Thus, the *rm* utility can fail to remove such files.

33098 The *-i* option causes *rm* to prompt and read the standard input even if the standard input is not  
 33099 a terminal, but in the absence of *-i* the mode prompting is not done when the standard input is  
 33100 not a terminal.

33101 **EXAMPLES**

33102 1. The following command:

33103 `rm a.out core`33104 removes the directory entries: **a.out** and **core**.

33105 2. The following command:

33106 `rm -Rf junk`33107 removes the directory **junk** and all its contents, without prompting.33108 **RATIONALE**

33109 The *-i* option causes *rm* to prompt and read the standard input even if the standard input is not  
 33110 a terminal, but, in the absence of *-i*, the mode prompting is not done when the standard input is  
 33111 not a terminal.

33112 For absolute clarity, paragraphs (2b) and (3) in the DESCRIPTION of *rm* describing the behavior  
 33113 when prompting for confirmation, should be interpreted in the following manner:

```

33114 if ((NOT f_option) AND
33115 ((not_writable AND input_is_terminal) OR i_option))

```

33116 The exact format of the interactive prompts is unspecified. Only the general nature of the  
 33117 contents of prompts are specified because implementations may desire more descriptive  
 33118 prompts than those used on historical implementations. Therefore, an application not using the  
 33119 `-f` option, or using the `-i` option, relies on the system to provide the most suitable dialog directly  
 33120 with the user, based on the behavior specified.

33121 The `-r` option is historical practice on all known systems. The synonym `-R` option is provided  
 33122 for consistency with the other utilities in this volume of IEEE Std. 1003.1-200x that provide  
 33123 options requesting recursive descent through the file hierarchy.

33124 The behavior of the `-f` option in historical versions of *rm* is inconsistent. In general, along with  
 33125 “forcing” the unlink without prompting for permission, it always causes diagnostic messages to  
 33126 be suppressed and the exit status to be unmodified for nonexistent operands and files that  
 33127 cannot be unlinked. In some versions, however, the `-f` option suppresses usage messages and  
 33128 system errors as well. Suppressing such messages is not a service to either shell scripts or users.

33129 It is less clear that error messages regarding unlinkable files should be suppressed. Although this  
 33130 is historical practice, this volume of IEEE Std. 1003.1-200x does not permit the `-f` option to  
 33131 suppress such messages.

33132 When given the `-r` and `-i` options, historical versions of *rm* prompt the user twice for each  
 33133 directory, once before removing its contents and once before actually attempting to delete the  
 33134 directory entry that names it. This allows the user to “prune” the file hierarchy walk. Historical  
 33135 versions of *rm* were inconsistent in that some did not do the former prompt for directories  
 33136 named on the command line and others had obscure prompting behavior when the `-i` option  
 33137 was specified and the permissions of the file did not permit writing. The POSIX Shell and  
 33138 Utilities *rm* differs little from historic practice, but does require that prompts be consistent.  
 33139 Historical versions of *rm* were also inconsistent in that prompts were done to both standard  
 33140 output and standard error. This volume of IEEE Std. 1003.1-200x requires that prompts be done  
 33141 to standard error, for consistency with *cp* and *mv*, and to allow historical extensions to *rm* that  
 33142 provide an option to list deleted files on standard output.

33143 The *rm* utility is required to descend to arbitrary depths so that any file hierarchy may be  
 33144 deleted. This means, for example, that the *rm* utility cannot run out of file descriptors during its  
 33145 descent (that is, if the number of file descriptors is limited, *rm* cannot be implemented in the  
 33146 historical fashion where one file descriptor is used per directory level). Also, *rm* is not permitted  
 33147 to fail because of path length restrictions, unless an operand specified by the user is longer than  
 33148 {PATH\_MAX}.

33149 The *rm* utility removes symbolic links themselves, not the files they refer to, as a consequence of  
 33150 the dependence on the *unlink()* functionality, per the DESCRIPTION. When removing  
 33151 hierarchies with `-r` or `-R`, the prohibition on following symbolic links has to be made explicit.

| 33162 | <b>Issue 6</b> |                                                                                                     |
| 33163 |                | Text is added to clarify actions relating to symbolic links as specified in the IEEE P1003.2b draft |
| 33164 |                | standard.                                                                                           |

33165 **NAME**33166       rm del — remove a delta from an SCCS file (**DEVELOPMENT**)33167 **SYNOPSIS**33168 xSI       rm del -r *SID file...*

33169

33170 **DESCRIPTION**

33171       The *rm del* utility shall remove the delta specified by the *SID* from each named SCCS file. The  
 33172       delta to be removed shall be the most recent delta in its branch in the delta chain of each named  
 33173       SCCS file. In addition, the application shall ensure that the *SID* specified is not that of a version  
 33174       being edited for the purpose of making a delta; that is, if a *p-file* (see *get* on page 510) exists for  
 33175       the named SCCS file, the *SID* specified shall not appear in any entry of the *p-file*.

33176       Removal of a delta is restricted to:

- 33177           1. The user who made the delta
- 33178           2. The owner of the SCCS file
- 33179           3. The owner of the directory containing the SCCS file

33180 **OPTIONS**

33181       The *rm del* utility shall conform to the System Interface Definitions volume of  
 33182       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

33183       The following option shall be supported:

33184       -r *SID*       Specify the SCCS identification string (*SID*) of the delta to be deleted.33185 **OPERANDS**

33186       The following operand shall be supported:

33187       *file*       A path name of an existing SCCS file or a directory. If *file* is a directory, *rm del*  
 33188       behaves as though each file in the directory were specified as a named file, except  
 33189       that non-SCCS files (last component of the path name does not begin with **s.**) and  
 33190       unreadable files are silently ignored.

33191       If a single instance *file* is specified as *'-'*, the standard input is read; each line of  
 33192       the standard input is taken to be the name of an SCCS file to be processed. Non-  
 33193       SCCS files and unreadable files are silently ignored.

33194 **STDIN**

33195       The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 33196       line of the text file shall be interpreted as an SCCS path name.

33197 **INPUT FILES**

33198       The SCCS files are files of unspecified format.

33199 **ENVIRONMENT VARIABLES**33200       The following environment variables shall affect the execution of *rm del*:

33201       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 33202       If *LANG* is unset or null, the corresponding value from the implementation-  
 33203       dependent default locale shall be used. If any of the internationalization variables  
 33204       contains an invalid setting, the utility shall behave as if none of the variables had  
 33205       been defined.

33206       *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 33207       internationalization variables.

- 33208 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 33209 characters (for example, single-byte as opposed to multi-byte characters in  
 33210 arguments and input files).
- 33211 **LC\_MESSAGES**  
 33212 Determine the locale that should be used to affect the format and contents of  
 33213 diagnostic messages written to standard error.
- 33214 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 33215 **ASYNCHRONOUS EVENTS**  
 33216 Default.
- 33217 **STDOUT**  
 33218 Not used.
- 33219 **STDERR**  
 33220 Used only for diagnostic messages.
- 33221 **OUTPUT FILES**  
 33222 The SCCS files are files of unspecified format. During processing of a *file*, a temporary *x-file*, as  
 33223 described in *admin* on page 160, may be created and deleted; a locking *z-file*, as described in *get*  
 33224 on page 510, may be created and deleted.
- 33225 **EXTENDED DESCRIPTION**  
 33226 None.
- 33227 **EXIT STATUS**  
 33228 The following exit values shall be returned:  
 33229 0 Successful completion.  
 33230 >0 An error occurred.
- 33231 **CONSEQUENCES OF ERRORS**  
 33232 Default.
- 33233 **APPLICATION USAGE**  
 33234 None.
- 33235 **EXAMPLES**  
 33236 None.
- 33237 **RATIONALE**  
 33238 None.
- 33239 **FUTURE DIRECTIONS**  
 33240 None.
- 33241 **SEE ALSO**  
 33242 *delta, get, prs*
- 33243 **CHANGE HISTORY**  
 33244 First released in Issue 2.
- 33245 **Issue 4**  
 33246 Format reorganized.  
 33247 Utility Syntax Guidelines support mandated.  
 33248 Internationalized environment variable support mandated.

33249 **Issue 6**

33250 The normative text is reworded to avoid use of the term “must” for application requirements.

33251 **NAME**

33252           rmdir — remove directories

33253 **SYNOPSIS**33254           rmdir [-p] *dir...*33255 **DESCRIPTION**

33256           The *rmdir* utility shall remove the directory entry specified by each *dir* operand, which the  
 33257           application shall ensure refers to an empty directory.

33258           Directories shall be processed in the order specified. If a directory and a subdirectory of that  
 33259           directory are specified in a single invocation of the *rmdir* utility, the application shall specify the  
 33260           subdirectory before the parent directory so that the parent directory will be empty when the  
 33261           *rmdir* utility tries to remove it.

33262 **OPTIONS**

33263           The *rmdir* utility shall conform to the System Interface Definitions volume of  
 33264           IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

33265           The following option shall be supported:

33266           **-p**           Remove all directories in a path name. For each *dir* operand:

- 33267                       1. The directory entry it names shall be removed.
- 33268                       2. If the *dir* operand includes more than one path name component, effects  
 33269                       equivalent to the following command shall occur:

33270                       rmdir -p \$(dirname *dir*)

33271 **OPERANDS**

33272           The following operand shall be supported:

33273           *dir*           A path name of an empty directory to be removed.

33274 **STDIN**

33275           Not used.

33276 **INPUT FILES**

33277           None.

33278 **ENVIRONMENT VARIABLES**

33279           The following environment variables shall affect the execution of *rmdir*:

33280           **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 33281                       If *LANG* is unset or null, the corresponding value from the implementation-  
 33282                       dependent default locale shall be used. If any of the internationalization variables  
 33283                       contains an invalid setting, the utility shall behave as if none of the variables had  
 33284                       been defined.

33285           **LC\_ALL**      If set to a non-empty string value, override the values of all the other  
 33286                       internationalization variables.

33287           **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 33288                       characters (for example, single-byte as opposed to multi-byte characters in  
 33289                       arguments).

33290           **LC\_MESSAGES**

33291                       Determine the locale that should be used to affect the format and contents of  
 33292                       diagnostic messages written to standard error.

33293 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

### 33294 ASYNCHRONOUS EVENTS

33295 Default.

### 33296 STDOUT

33297 Not used.

### 33298 STDERR

33299 Used only for diagnostic messages.

### 33300 OUTPUT FILES

33301 None.

### 33302 EXTENDED DESCRIPTION

33303 None.

### 33304 EXIT STATUS

33305 The following exit values shall be returned:

33306 0 Each directory entry specified by a *dir* operand was removed successfully.

33307 >0 An error occurred.

### 33308 CONSEQUENCES OF ERRORS

33309 Default.

### 33310 APPLICATION USAGE

33311 The definition of an empty directory is one that contains, at most, directory entries for dot and  
33312 dot-dot.

### 33313 EXAMPLES

33314 If a directory **a** in the current directory is empty except it contains a directory **b** and **a/b** is empty  
33315 except it contains a directory **c**:

33316 `rmdir -p a/b/c`

33317 removes all three directories.

### 33318 RATIONALE

33319 On historical System V systems, the **-p** option also caused a message to be written to the  
33320 standard output. The message indicated whether the whole path was removed or whether part  
33321 of the path remained for some reason. The STDERR section requires this diagnostic when the  
33322 entire path specified by a *dir* operand is not removed, but does not allow the status message  
33323 reporting success to be written as a diagnostic.

33324 The *rmdir* utility on System V also included an **-s** option that suppressed the informational  
33325 message output by the **-p** option. This option has been omitted because the informational  
33326 message is not specified by this volume of IEEE Std. 1003.1-200x.

### 33327 FUTURE DIRECTIONS

33328 None.

### 33329 SEE ALSO

33330 *rm*, the System Interfaces volume of IEEE Std. 1003.1-200x, *remove()*, *rmdir()*, *unlink()*

33337 **NAME**33338           sact — print current SCCS file-editing activity (**DEVELOPMENT**)33339 **SYNOPSIS**33340 XSI       sact *file...*

33341

33342 **DESCRIPTION**

33343       The *sact* utility shall inform the user of any impending deltas to a named SCCS file by writing a  
 33344       list to standard output. This situation occurs when *get -e* has been executed previously without  
 33345       a subsequent execution of *delta*.

33346 **OPTIONS**

33347       None.

33348 **OPERANDS**

33349       The following operand shall be supported:

33350       *file*       A path name of an existing SCCS file or a directory. If *file* is a directory, *sact*  
 33351       behaves as though each file in the directory were specified as a named file, except  
 33352       that non-SCCS files (last component of the path name does not begin with *s.*) and  
 33353       unreadable files are silently ignored.

33354       If a single instance *file* is specified as *'-'*, the standard input is read; each line of  
 33355       the standard input shall be taken to be the name of an SCCS file to be processed.  
 33356       Non-SCCS files and unreadable files shall be silently ignored.

33357 **STDIN**

33358       The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 33359       line of the text file shall be interpreted as an SCCS path name.

33360 **INPUT FILES**

33361       Any SCCS files interrogated are files of an unspecified format.

33362 **ENVIRONMENT VARIABLES**33363       The following environment variables shall affect the execution of *sact*:

33364       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 33365       If *LANG* is unset or null, the corresponding value from the implementation-  
 33366       dependent default locale shall be used. If any of the internationalization variables  
 33367       contains an invalid setting, the utility shall behave as if none of the variables had  
 33368       been defined.

33369       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 33370       internationalization variables.

33371       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 33372       characters (for example, single-byte as opposed to multi-byte characters in  
 33373       arguments and input files).

33374       *LC\_MESSAGES*

33375       Determine the locale that should be used to affect the format and contents of  
 33376       diagnostic messages written to standard error.

33377       *NLSPATH*     Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

33378 **ASYNCHRONOUS EVENTS**

33379 Default.

33380 **STDOUT**

33381 The output for each named file shall consist of a line in the following format:

33382 "%sΔ%sΔ%sΔ%sΔ%s\n", &lt;SID&gt;, &lt;new SID&gt;, &lt;login&gt;, &lt;date&gt;, &lt;time&gt;

33383 <SID> Specifies the SID of a delta that currently exists in the SCCS file to which changes  
 33384 are made to make the new delta.

33385 <new SID> Specifies the SID for the new delta to be created.

33386 <login> Contains the login name of the user who makes the delta (that is, who executed a  
 33387 *get* for editing).

33388 <date> Contains the date that *get -e* was executed, in the format used by the *prs :D:* data  
 33389 keyword.

33390 <time> Contains the time that *get -e* was executed, in the format used by the *prs :T:* data  
 33391 keyword.

33392 If there is more than one named file or if a directory or standard input is named, each path name  
 33393 shall be written before each of the preceding lines:

33394 "\n%s:\n", &lt;pathname&gt;

33395 **STDERR**

33396 Used only for optional informative messages concerning SCCS files with no impending deltas,  
 33397 and for diagnostic messages.

33398 **OUTPUT FILES**

33399 None.

33400 **EXTENDED DESCRIPTION**

33401 None.

33402 **EXIT STATUS**

33403 The following exit values shall be returned:

33404 0 Successful completion.

33405 &gt;0 An error occurred.

33406 **CONSEQUENCES OF ERRORS**

33407 Default.

33408 **APPLICATION USAGE**

33409 None.

33410 **EXAMPLES**

33411 None.

33412 **RATIONALE**

33413 None.

33414 **FUTURE DIRECTIONS**

33415 None.

33416 **SEE ALSO**33417 *delta, get, unget*33418 **CHANGE HISTORY**

33419 First released in Issue 2.

33421 Format reorganized.

33422 Utility Syntax Guidelines support mandated.

33423 Internationalized environment variable support mandated.

33424 **Issue 4, Version 2**33425 The `STDERR` section encompasses informative messages concerning SCCS files with no  
33426 impending deltas.

## 33427 NAME

33428        *sccs* — front end for the SCCS subsystem (**DEVELOPMENT**)

## 33429 SYNOPSIS

33430 XSI        *sccs* [*-r*][*-d path*][*-p path*] *command* [*options...*][*operands...*]

33431

## 33432 DESCRIPTION

33433        The *sccs* utility is a front end to the SCCS programs. It also includes the capability to run set-  
33434 user-id to another user to provide additional protection.33435        The *sccs* utility shall invoke the specified *command* with the specified *options* and *operands*. By  
33436 default, each of the *operands* shall be modified by prefixing it with the string **SCCS/s..**.33437        The *command* operand can be one of the SCCS utilities in this volume of IEEE Std. 1003.1-200x  
33438 (*admin*, *delta*, *get*, *prs*, *rmdel*, *sact*, *unget*, *val*, or *what*) or one of the pseudo-utilities listed in the  
33439 EXTENDED DESCRIPTION section.

## 33440 OPTIONS

33441        The *sccs* utility shall conform to the System Interface Definitions volume of  
33442 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines, except that *options* operands are  
33443 actually options to be passed to the utility named by *command*. When the portion of the  
33444 command:33445        *command* [*options ...*] [*operands ...*]33446        is considered, all of the pseudo-utilities used as *command* shall support the Utility Syntax  
33447 Guidelines. Any of the other SCCS utilities that can be invoked in this manner support the  
33448 Guidelines to the extent indicated by their individual OPTIONS sections.33449        The following options shall be supported preceding the *command* operand:33450        **-d path**        A path name of a directory to be used as a root directory for the SCCS files. The  
33451                        default is the current directory. The **-d** option takes precedence over the  
33452                        *PROJECTDIR* variable. See **-p**.33453        **-p path**        A path name of a directory in which the SCCS files are located. The default is the  
33454                        **SCCS** directory.33455        The **-p** option differs from the **-d** option in that the **-d** option-argument is  
33456                        prefixed to the entire path name and the **-p** option-argument is inserted before the  
33457                        final component of the path name. For example:33458        *sccs -d /x -p y get a/b*

33459        converts to:

33460        *get /x/a/y/s.b*

33461        This allows the creation of aliases such as:

33462        *alias syssccs="sccs -d /usr/src"*

33463        which is used as:

33464        *syssccs get cmd/who.c*33465        **-r**                Invoke *command* with the real user ID of the process, not any effective user ID that  
33466                        the *sccs* utility is set to. Certain commands (*admin*, **check**, **clean**, **diffs**, **info**, *rmdel*,  
33467                        and **tell**) cannot be run set-user-ID by all users, since this would allow anyone to  
33468                        change the authroizations. These commands are always run as the real user.

33469 **OPERANDS**

33470 The following operands shall be supported:

33471 *command* An SCCS utility name or the name of one of the pseudo-utilities listed in the  
 33472 EXTENDED DESCRIPTION section.

33473 *options* An option or option-argument to be passed to *command*.

33474 *operands* An operand to be passed to *command*.

33475 **STDIN**33476 See the utility description for the specified *command*.33477 **INPUT FILES**33478 See the utility description for the specified *command*.33479 **ENVIRONMENT VARIABLES**33480 The following environment variables shall affect the execution of *sccs*:

33481 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 33482 If *LANG* is unset or null, the corresponding value from the implementation-  
 33483 dependent default locale shall be used. If any of the internationalization variables  
 33484 contains an invalid setting, the utility shall behave as if none of the variables had  
 33485 been defined.

33486 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 33487 internationalization variables.

33488 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 33489 characters (for example, single-byte as opposed to multi-byte characters in  
 33490 arguments and input files).

33491 *LC\_MESSAGES*

33492 Determine the locale that should be used to affect the format and contents of  
 33493 diagnostic messages written to standard error.

33494 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

33495 *PROJECTDIR*

33496 Provide a default value for the *-d path* option. If the value of *PROJECTDIR* begins  
 33497 with a slash, it shall be considered an absolute path name; otherwise, the value of  
 33498 *PROJECTDIR* is treated as a user name and that user's initial working directory  
 33499 shall be examined for a subdirectory **src** or **source**. If such a directory is found, it  
 33500 shall be used. Otherwise, the value shall be used as a relative path name.

33501 Additional environment variable effects may be found in the utility description for the specified  
 33502 *command*.

33503 **ASYNCHRONOUS EVENTS**

33504 Default.

33505 **STDOUT**33506 See the utility description for the specified *command*.33507 **STDERR**33508 See the utility description for the specified *command*.

33509 **OUTPUT FILES**

33510 See the utility description for the specified *command*.

33511 **EXTENDED DESCRIPTION**

33512 The following pseudo-utilities are supported as *command* operands. All options referred to in the  
 33513 following list are values given in the *options* operands following *command*.

33514 **check** Equivalent to **info**, except that nothing is printed if nothing is being edited, and a non-  
 33515 zero exit status is returned if anything is being edited. The intent is to have this  
 33516 included in an “install” entry in a makefile to ensure that everything is included into  
 33517 the SCCS file before a version is installed.

33518 **clean** Remove everything from the current directory that can be recreated from SCCS files,  
 33519 but do not remove any files being edited. If the **-b** option is given, branches are ignored  
 33520 in the determination of whether they are being edited; this is dangerous if branches are  
 33521 kept in the same directory.

33522 **create** Create an SCCS file, taking the initial contents from the file of the same name. Any  
 33523 options to *admin* are accepted. If the creation is successful, the original files are  
 33524 renamed by prefixing the basenames with a comma. These renamed files should be  
 33525 removed after it has been verified that the SCCS files have been created successfully.

33526 **delget** Perform a *delta* on the named files and then *get* new versions. The new versions have ID  
 33527 keywords expanded and are not editable. Any **-m**, **-p**, **-r**, **-s**, and **-y** options are passed  
 33528 to *delta*, and any **-b**, **-c**, **-e**, **-i**, **-k**, **-l**, **-s**, and **-x** options are passed to *get*.

33529 **deledit** Equivalent to **delget**, except that the *get* phase includes the **-e** option. This option is  
 33530 useful for making a checkpoint of the current editing phase. The same options are  
 33531 passed to *delta* as described above, and all the options listed for *get* above except **-e** are  
 33532 passed to *edit*.

33533 **diffs** Write a difference listing between the current version of the files checked out for  
 33534 editing and the versions in SCCS format. Any **-r**, **-c**, **-i**, **-x**, and **-t** options are passed to  
 33535 *get*; any **-l**, **-s**, **-e**, **-f**, **-h**, and **-b** options are passed to *diff*. A **-C** option is passed to *diff*  
 33536 as **-c**.

33537 **edit** Equivalent to *get -e*.

33538 **fix** Remove the named delta, but leave a copy of the delta with the changes that were in it.  
 33539 It is useful for fixing small compiler bugs, and so on. The application shall ensure that it  
 33540 is followed by a **-r** *SID* option. Since **fix** doesn't leave audit trails, it should be used  
 33541 carefully.

33542 **info** Write a listing of all files being edited. If the **-b** option is given, branches (that is, SIDs  
 33543 with two or fewer components) are ignored. If a **-u** *user* option is given, then only files  
 33544 being edited by the named user are listed. A **-U** option is equivalent to  
 33545 **-u**<current user>.

33546 **print** Write out verbose information about the named files, equivalent to *sccs prs*.

33547 **tell** Write a <newline>-separated list of the files being edited to standard output. Takes the  
 33548 **-b**, **-u**, and **-U** options like **info** and **check**.

33549 **unedit** This is the opposite of an **edit** or a *get -e*. It should be used with caution, since any  
 33550 changes made since the *get* are lost.

33551 **EXIT STATUS**

33552 The following exit values shall be returned:

33553 0 Successful completion.

33554 &gt;0 An error occurred.

33555 **CONSEQUENCES OF ERRORS**

33556 Default.

33557 **APPLICATION USAGE**

33558 Many of the SCCS utilities take directory names as operands as well as specific file names. The  
 33559 pseudo-utilities supported by *sccs* are not described as having this capability, but are not  
 33560 prohibited from doing so.

33561 **EXAMPLES**

33562 1. To get a file for editing, edit it and produce a new delta:

33563 `sccs get -e file.c`33564 `ex file.c`33565 `sccs delta file.c`

33566 2. To get a file from another directory:

33567 `sccs -p /usr/src/sccs/s. get cc.c`

33568 or:

33569 `sccs get /usr/src/sccs/s.cc.c`

33570 3. To make a delta of a large number of files in the current directory:

33571 `sccs delta *.c`

33572 4. To get a list of files being edited that are not on branches:

33573 `sccs info -b`

33574 5. To delta everything being edited by the current user:

33575 `sccs delta $(sccs tell -U)`

33576 6. In a makefile, to get source files from an SCCS file if it does not already exist:

33577 `SRCS = <list of source files>`33578 `$(SRCS):`33579 `sccs get $(REL) $@`33580 **RATIONALE**

33581 None.

33582 **FUTURE DIRECTIONS**

33583 None.

33584 **SEE ALSO**33585 *admin, delta, get, make, prs, rmdel, sact, unget, val, what*33586 **CHANGE HISTORY**

33587 First released in Issue 4.

33588 **Issue 6**

33589 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
33590 “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of  
33591 *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.

33592 The normative text is reworded to avoid use of the term “must” for application requirements.

33593 **NAME**33594 `sed` — stream editor33595 **SYNOPSIS**33596 `sed [-n] script[file...]`33597 `sed [-n][-e script...[-f script_file]...[file...]`33598 **DESCRIPTION**

33599 The *sed* utility is a stream editor that shall read one or more text files, make editing changes  
 33600 according to a script of editing commands, and write the results to standard output. The script  
 33601 shall be obtained from either the *script* operand string or a combination of the option-arguments  
 33602 from the `-e script` and `-f script_file` options.

33603 **OPTIONS**

33604 The *sed* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 33605 Section 12.2, Utility Syntax Guidelines, except that the order of presentation of the `-e` and `-f`  
 33606 options is significant.

33607 The following options shall be supported:

33608 `-e script` Add the editing commands specified by the *script* option-argument to the end of  
 33609 the script of editing commands. The *script* option-argument shall have the same  
 33610 properties as the *script* operand, described in the OPERANDS section.

33611 `-f script_file` Add the editing commands in the file *script\_file* to the end of the script.

33612 `-n` Suppress the default output (in which each line, after it is examined for editing, is  
 33613 written to standard output). Only lines explicitly selected for output are written.

33614 Multiple `-e` and `-f` options may be specified. All commands shall be added to the script in the  
 33615 order specified, regardless of their origin.

33616 **OPERANDS**

33617 The following operands shall be supported:

33618 *file* A path name of a file whose contents are read and edited. If multiple *file* operands  
 33619 are specified, the named files shall be read in the order specified and the  
 33620 concatenation shall be edited. If no *file* operands are specified, the standard input  
 33621 shall be used.

33622 *script* A string to be used as the script of editing commands. The application shall not  
 33623 present a *script* that violates the restrictions of a text file except that the final  
 33624 character need not be a <newline> character.

33625 **STDIN**

33626 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
 33627 section.

33628 **INPUT FILES**

33629 The input files shall be text files. The *script\_files* named by the `-f` option shall consist of editing  
 33630 commands.

33631 **ENVIRONMENT VARIABLES**

33632 The following environment variables shall affect the execution of *sed*:

33633 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 33634 If *LANG* is unset or null, the corresponding value from the implementation-  
 33635 dependent default locale shall be used. If any of the internationalization variables  
 33636 contains an invalid setting, the utility shall behave as if none of the variables had

33637                   been defined.

33638       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
33639                   internationalization variables.

33640       **LC\_COLLATE**  
33641                   Determine the locale for the behavior of ranges, equivalence classes, and multi-  
33642                   character collating elements within regular expressions.

33643       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
33644                   characters (for example, single-byte as opposed to multi-byte characters in  
33645                   arguments and input files), and the behavior of character classes within regular  
33646                   expressions.

33647       **LC\_MESSAGES**  
33648                   Determine the locale that should be used to affect the format and contents of  
33649                   diagnostic messages written to standard error.

33650 XSI       **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

33651 **ASYNCHRONOUS EVENTS**  
33652       Default.

33653 **STDOUT**  
33654       The input files shall be written to standard output, with the editing commands specified in the  
33655       script applied. If the **-n** option is specified, only those input lines selected by the script shall be  
33656       written to standard output.

33657 **STDERR**  
33658       Used only for diagnostic messages.

33659 **OUTPUT FILES**  
33660       The output files shall be text files whose formats are dependent on the editing commands given.

33661 **EXTENDED DESCRIPTION**  
33662       The *script* shall consist of editing commands of the following form:

33663       [*address* [ , *address* ] ] *function*

33664       where *function* represents a single-character command verb from the list in **Editing Commands**  
33665       in **sed** on page 881, followed by any applicable arguments.

33666       Zero or more <blank>s shall be accepted before the first address and before function. Any  
33667       number of semicolons shall be accepted before the first address.

33668       In default operation, *sed* cyclically shall copy a line of input, less its terminating <newline>, into  
33669       a pattern space (unless there is something left after a **D** command), apply in sequence all  
33670       commands whose addresses select that pattern space, and at the end of the script copy the  
33671       pattern space to standard output (except when **-n** is specified) and delete the pattern space.  
33672       Whenever the pattern space is written to standard output or a named file, *sed* shall immediately  
33673       follow it with a <newline>.

33674       Some of the editing commands use a hold space to save all or part of the pattern space for  
33675       subsequent retrieval. The pattern and hold spaces shall each be able to hold at least 8 192 bytes.

### 33676 Addresses in sed

33677 An address is either a decimal number that counts input lines cumulatively across files, a '\$' character that addresses the last line of input, or a context address (which consists of a BRE, as described in **Regular Expressions in sed**, preceded and followed by a delimiter, usually a slash).

33680 An editing command with no addresses shall select every pattern space.

33681 An editing command with one address shall select each pattern space that matches the address.

33682 An editing command with two addresses shall select the inclusive range from the first pattern space that matches the first address through the next pattern space that matches the second. (If the second address is a number less than or equal to the line number first selected, only one line shall be selected.) Starting at the first line following the selected range, *sed* shall look again for the first address. Thereafter, the process shall be repeated. Omitting either or both of the address components in the following form produces undefined results:

33688 [*address* [, *address* ] ]

### 33689 Regular Expressions in sed

33690 The *sed* utility shall support the BREs described in the System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 9.3, Basic Regular Expressions, with the following additions:

- 33692 • In a context address, the construction "`\cBREc`", where *c* is any character other than  
33693 backslash or <newline>, shall be identical to "`/BRE/`". If the character designated by *c*  
33694 appears following a backslash, then it shall be considered to be that literal character, which  
33695 shall not terminate the BRE. For example, in the context address "`.mc |`" the second *x* stands  
33696 for itself, so that the BRE is "`abcxdef`".
- 33697 • The escape sequence '`\n`' shall match a <newline> embedded in the pattern space. A literal  
33698 <newline> character shall not be used in the BRE of a context address or in the substitute  
33699 function.
- 33700 • If an RE is empty (that is, no pattern is specified) *sed* shall behave as if the last RE used in the  
33701 last command applied (either as an address or as part of a substitute command) was  
33702 specified.

### 33703 Editing Commands in sed

33704 In the following list of editing commands, the maximum number of permissible addresses for  
33705 each function is indicated by [*0addr*], [*1addr*], or [*2addr*], representing zero, one, or two  
33706 addresses.

33707 The argument *text* shall consist of one or more lines. Each embedded <newline> in the text shall  
33708 be preceded by a backslash. Other backslashes in text shall be removed, and the following  
33709 character shall be treated literally.

33710 The **r** and **w** command verbs, and the **w** flag to the **s** command, take an optional *rfile* (or *wfile*)  
33711 parameter, separated from the command verb letter or flag by one or more <blank>s;  
33712 implementations may allow zero separation as an extension.

33713 The argument *rfile* or the argument *wfile* shall terminate the editing command. Each *wfile* shall be  
33714 created before processing begins. Implementations shall support at least ten *wfile* arguments in  
33715 the script; the actual number (greater than or equal to 10) that shall be supported by the  
33716 implementation is unspecified. The use of the *wfile* parameter shall cause that file to be initially  
33717 created, if it does not exist, or shall replace the contents of an existing file.

33718 The **b**, **r**, **s**, **t**, **w**, **y**, and **:** command verbs shall accept additional arguments. The following  
33719 synopses indicate which arguments shall be separated from the command verbs by a single  
33720 <space>.

33721 The **a** and **r** commands schedule text for later output. The text specified for the **a** command, and  
33722 the contents of the file specified for the **r** command, shall be written to standard output just  
33723 before the next attempt to fetch a line of input when executing the **N** or **n** commands, or when  
33724 reaching the end of the script. If written when reaching the end of the script, and the **-n** option  
33725 was not specified, the text shall be written after copying the pattern space to standard output.  
33726 The contents of the file specified for the **r** command shall be as of the time the output is written,  
33727 not the time the **r** command is applied. The text shall be output in the order in which the **a** and **r**  
33728 commands were applied to the input.

33729 Command verbs other than **{**, **a**, **b**, **c**, **i**, **r**, **t**, **w**, **:**, and **#** can be followed by a semicolon, optional  
33730 <blank>s, and another command verb. However, when the **s** command verb is used with the **w**  
33731 flag, following it with another command in this manner produces undefined results.

33732 A function can be preceded by one or more '!' characters, in which case the function shall be  
33733 applied if the addresses do not select the pattern space. Zero or more <blank>s shall be accepted  
33734 before the first '!' character. It is unspecified whether <blank> characters can follow a '!'  
33735 character, and conforming applications shall not follow a '!' character with <blank>s.

33736 [2addr] {function  
33737 function  
33738 ...  
33739 } Execute a list of *sed* functions only when the pattern space is selected. The list of  
33740 *sed* functions shall be surrounded by braces and separated by <newline>s, as  
33741 follows. The braces can be preceded or followed by <blank>s. The functions can  
33742 be preceded by <blank>s, but shall not be followed by <blank>s. The <right-  
33743 brace> shall be preceded by a <newline> and can be preceded or followed by  
33744 <blank>s.

33745 [1addr]a\  
33746 text Write text to standard output as described previously.

33747 [2addr]b [label]  
33748 Branch to the **:** function bearing the *label*. If *label* is not specified, branch to the end  
33749 of the script. The implementation shall support *labels* recognized as unique up to  
33750 at least 8 characters; the actual length (greater than or equal to 8) that shall be  
33751 supported by the implementation is unspecified. It is unspecified whether  
33752 exceeding a label length causes an error or a silent truncation.

33753 [2addr]c\  
33754 text Delete the pattern space. With a 0 or 1 address or at the end of a 2-address range,  
33755 place *text* on the output and start the next cycle.

33756 [2addr]d Delete the pattern space and start the next cycle.

33757 [2addr]D Delete the initial segment of the pattern space through the first <newline> and  
33758 start the next cycle.

33759 [2addr]g Replace the contents of the pattern space by the contents of the hold space.

33760 [2addr]G Append to the pattern space a <newline> followed by the contents of the hold  
33761 space.

33762 [2addr]h Replace the contents of the hold space with the contents of the pattern space.

|       |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 33763 | [2addr]H                       | Append to the hold space a <newline> followed by the contents of the pattern space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 33767 | [2addr]l                       | (The letter ell.) Write the pattern space to standard output in a visually unambiguous form. The characters listed in the System Interface Definitions volume of IEEE Std. 1003.1-200x, Table 5-1, Escape Sequences and Associated Actions ('\\', '\a', '\b', '\f', '\r', '\t', '\v') shall be written as the corresponding escape sequence; the '\n' in that table is not applicable. Non-printable characters not in that table shall be written as one three-digit octal number (with a preceding backslash) for each byte in the character (most significant byte first). If the size of a byte on the system is greater than 9 bits, the format used for non-printable characters is implementation-dependent. |
| 33768 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 33797 |                                | Substitute the replacement string for instances of the BRE in the pattern space. Any character other than backslash or <newline> can be used instead of a slash to delimit the BRE and the replacement. Within the BRE and the replacement, the BRE delimiter itself can be used as a literal character if it is preceded by a backslash.                                                                                                                                                                                                                                                                                                                                                                           |

| 33802 |                                | An ampersand ('&') appearing in the replacement shall be replaced by the string matching the BRE. The special meaning of '&' in this context can be suppressed by preceding it by a backslash. The characters '\n', where <i>n</i> is a digit, shall be replaced by the text matched by the corresponding backreference expression. For each backslash ('\') encountered in scanning <i>replacement</i> from beginning to end, the backslash shall be discarded and the following character shall lose its special meaning (if any). It is unspecified what special meaning is given to any character                                                                                                               |
| 33803 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 33817 | <b>n</b>                         | Substitute for the <i>n</i> th occurrence only of the BRE found within the                                      |  |
| 33818 |                                  | pattern space.                                                                                                  |  |
| 33819 | <b>g</b>                         | Globally substitute for all non-overlapping instances of the BRE                                                |  |
| 33820 |                                  | rather than just the first one. If both <b>g</b> and <b>n</b> are specified, the results                        |  |
| 33821 |                                  | are unspecified.                                                                                                |  |
| 33822 | <b>p</b>                         | Write the pattern space to standard output if a replacement was                                                 |  |
| 33823 |                                  | made.                                                                                                           |  |
| 33824 | <b>w wfile</b>                   | Write. Append the pattern space to <i>wfile</i> if a replacement was made.                                      |  |
| 33825 |                                  | A conforming application shall precede the <i>wfile</i> argument with one                                       |  |
| 33826 |                                  | or more <blank>s. If the <b>w</b> flag is not the last flag value given in a                                    |  |
| 33827 |                                  | concatenation of multiple flag values, the results are undefined.                                               |  |
| 33828 | <b>[2addr]t [label]</b>          |                                                                                                                 |  |
| 33829 |                                  | Test. Branch to the <b>:</b> command verb bearing the <i>label</i> if any substitutions have been               |  |
| 33830 |                                  | made since the most recent reading of an input line or execution of a <b>t</b> . If <i>label</i> is             |  |
| 33831 |                                  | not specified, branch to the end of the script.                                                                 |  |
| 33832 | <b>[2addr]w wfile</b>            |                                                                                                                 |  |
| 33833 |                                  | Append {write) the pattern space to <i>wfile</i> .                                                              |  |
| 33834 | <b>[2addr]x</b>                  | Exchange the contents of the pattern and hold spaces.                                                           |  |
| 33835 | <b>[2addr]y/string1/string2/</b> |                                                                                                                 |  |
| 33836 |                                  | Replace all occurrences of characters in <i>string1</i> with the corresponding characters                       |  |
| 33837 |                                  | in <i>string2</i> . If a backslash followed by an <i>n</i> appear in <i>string1</i> or <i>string2</i> , the two |  |
| 33838 |                                  | characters shall be handled as a single <newline> character. If the number of                                   |  |
| 33839 |                                  | characters in <i>string1</i> and <i>string2</i> are not equal, or if any of the characters in <i>string1</i>    |  |
| 33840 |                                  | appear more than once, the results are undefined. Any character other than                                      |  |
| 33841 |                                  | backslash or <newline> can be used instead of slash to delimit the strings. If the                              |  |
| 33842 |                                  | delimiter is not <i>n</i> , within <i>string1</i> and <i>string2</i> , the delimiter itself can be used as a    |  |
| 33843 |                                  | literal character if it is preceded by a backslash. If a backslash character is                                 |  |
| 33844 |                                  | immediately followed by a backslash character in <i>string1</i> or <i>string2</i> , the two                     |  |
| 33845 |                                  | backslash characters shall be counted as a single literal backslash character. The                              |  |
| 33846 |                                  | meaning of a backslash followed by any character that is not <i>n</i> , a backslash, or the                     |  |
| 33847 |                                  | delimiter character is undefined.                                                                               |  |
| 33848 | <b>[0addr]:label</b>             | Do nothing. This command bears a <i>label</i> to which the <b>b</b> and <b>t</b> commands branch.               |  |
| 33849 | <b>[1addr]=</b>                  | Write the following to standard output:                                                                         |  |
| 33850 |                                  | "%d\n", <current line number>                                                                                   |  |
| 33851 | <b>[0addr]</b>                   | Ignore this empty command.                                                                                      |  |
| 33852 | <b>[0addr]#</b>                  | Ignore the '#' and the remainder of the line (treat them as a comment), with the                                |  |
| 33853 |                                  | single exception that if the first two characters in the script are "#n", the default                           |  |

33854                   output shall be suppressed; this shall be the equivalent of specifying **-n** on the  
33855                   command line.

### 33856 **EXIT STATUS**

33857           The following exit values shall be returned:

33858           **0**   Successful completion.

33859           **>0**   An error occurred.

### 33860 **CONSEQUENCES OF ERRORS**

33861           Default.

### 33862 **APPLICATION USAGE**

33863           Regular expressions match entire strings, not just individual lines, but a <newline> character is  
33864           matched by '**\n**' in a *sed* RE; a <newline> character is not allowed in an RE. Also note that '**\n**'  
33865           cannot be used to match a <newline> character at the end of an arbitrary input line; <newline>  
33866           characters appear in the pattern space as a result of the **N** editing command.

### 33867 **EXAMPLES**

33868           This *sed* script simulates the BSD *cat -s* command, squeezing excess blank lines from standard  
33869           input.

```
33870 sed -n '
33871 # Write non-empty lines.
33872 ./ {
33873 p
33874 d
33875 }
33876 # Write a single empty line, then look for more empty lines.
33877 /^$/ p
33878 # Get next line, discard the held <newline> (empty line),
33879 # and look for more empty lines.
33880 :Empty
33881 /^$/ {
33882 N
33883 s/./ /
33884 b Empty
33885 }
33886 # Write the non-empty line before going back to search
33887 # for the first in a set of empty lines.
33888 p
33889 '
```

### 33890 **RATIONALE**

33891           This volume of IEEE Std. 1003.1-200x requires implementations to support at least ten distinct  
33892           *wfiles*, matching historical practice on many implementations. Implementations are encouraged  
33893           to support more, but portable applications should not exceed this limit.

33894           The exit status codes specified here are different from those in System V. System V returns 2 for  
33895           garbled *sed* commands, but returns zero with its usage message or if the input file could not be  
33896           opened. The standard developers considered this to be a bug.

33897           The manner in which the **l** command writes non-printable characters was changed to avoid the  
33898           historical backspace-overstrike method, and other requirements to achieve unambiguous output  
33899           were added. See the RATIONALE for *ed* on page 369 for details of the format chosen, which is  
33900           the same as that chosen for *sed*.

33901 This volume of IEEE Std. 1003.1-200x requires implementations to provide pattern and hold  
 33902 spaces of at least 8 192 bytes, larger than the 4 000 bytes spaces used by some historical  
 33903 implementations, but less than the 20 480 bytes limit used in an early proposal. Implementations  
 33904 are encouraged to allocate dynamically larger pattern and hold spaces as needed.

33905 The requirements for acceptance of <blank>s and <space>s in command lines has been made  
 33906 more explicit than in early proposals to describe clearly the historical practice and to remove  
 33907 confusion about the phrase “protect initial blanks [*sic*] and tabs from the stripping that is done  
 33908 on every script line” that appears in much of the historical documentation of the *sed* utility  
 33909 description of text. (Not all implementations are known to have stripped <blank>s from text  
 33910 lines, although they all have allowed leading <blank>s preceding the address on a command  
 33911 line.)

33912 The treatment of ‘#’ comments differs from the SVID which only allows a comment as the first  
 33913 line of the script, but matches BSD-derived implementations. The comment character is treated  
 33914 as a command, and it has the same properties in terms of being accepted with leading <blank>s;  
 33915 the BSD implementation has historically supported this.

33916 Early proposals required that a *script\_file* have at least one non-comment line. Some historical  
 33917 implementations have behaved in unexpected ways if this were not the case. The standard  
 33918 developers considered that this was incorrect behavior and that application developers should  
 33919 not have to avoid this feature. A correct implementation of this volume of IEEE Std. 1003.1-200x  
 33920 shall permit *script\_files* that consist only of comment lines.

33921 Early proposals indicated that if **-e** and **-f** options were intermixed, all **-e** options were  
 33922 processed before any **-f** options. This has been changed to process them in the order presented  
 33923 because it matches historical practice and is more intuitive.

33924 The treatment of the **p** flag to the **s** command differs between System V and BSD-based systems  
 33925 when the default output is suppressed. In the two examples:

```
33926 echo a | sed 's/a/A/p'
33927 echo a | sed -n 's/a/A/p'
```

33928 This volume of IEEE Std. 1003.1-200x, BSD, System V documentation, and the SVID indicate that  
 33929 the first example should write two lines with **A**, whereas the second should write one. Some  
 33930 System V systems write the **A** only once in both examples because the **p** flag is ignored if the **-n**  
 33931 option is not specified.

33932 This is a case of a diametrical difference between systems that could not be reconciled through  
 33933 the compromise of declaring the behavior to be unspecified. The SVID/BSD/System V  
 33934 documentation behavior was adopted for this volume of IEEE Std. 1003.1-200x because:

- 33935 • No known documentation for any historic system describes the interaction between the **p**  
 33936 flag and the **-n** option.
- 33937 • The selected behavior is more correct as there is no technical justification for any interaction  
 33938 between the **p** flag and the **-n** option. A relationship between **-n** and the **p** flag might imply  
 33939 that they are only used together, but this ignores valid scripts that interrupt the cyclical  
 33940 nature of the processing through the use of the **D**, **d**, **q**, or branching commands. Such scripts  
 33941 rely on the **p** suffix to write the pattern space because they do not make use of the default  
 33942 output at the “bottom” of the script.
- 33943 • Because the **-n** option makes the **p** flag unnecessary, any interaction would only be useful if  
 33944 *sed* scripts were written to run both with and without the **-n** option. This is believed to be  
 33945 unlikely. It is even more unlikely that programmers have coded the **p** flag expecting it to be  
 33946 unnecessary. Because the interaction was not documented, the likelihood of a programmer  
 33947 discovering the interaction and depending on it is further decreased.

- 33948 • Finally, scripts that break under the specified behavior produce too much output instead of
- 33949 too little, which is easier to diagnose and correct.
- 33950 The form of the substitute command that uses the **n** suffix was limited to the first 512 matches in
- 33951 an early proposal. This limit has been removed because there is no reason an editor processing
- 33952 lines of {LINE\_MAX} length should have this restriction. The command **s/a/A/2047** should be
- 33953 able to substitute the 2047th occurrence of **a** on a line.
- 33954 The **b**, **t**, and **:** commands are documented to ignore leading white space, but no mention is
- 33955 made of trailing white space. Historical implementations of *sed* assigned different locations to
- 33956 the labels '**x**' and "**x**". This is not useful, and leads to subtle programming errors, but it is
- 33957 historical practice, and changing it could theoretically break working scripts. Implementors are
- 33958 encouraged to provide warning messages about labels that are never used or jumps to labels
- 33959 that do not exist.
- 33960 Historically, the *sed* **!** and **}** editing commands did not permit multiple commands on a single
- 33961 line using a semicolon as a command delimiter. Implementations are permitted, but not
- 33962 required, to support this extension.
- 33963 **FUTURE DIRECTIONS**
- 33964 None.
- 33965 **SEE ALSO**
- 33966 *awk*, *ed*, *grep*
- 33967 **CHANGE HISTORY**
- 33968 First released in Issue 2.
- 33969 **Issue 4**
- 33970 Aligned with the ISO/IEC 9945-2:1993 standard.
- 33971 **Issue 5**
- 33972 FUTURE DIRECTIONS section added.
- 33973 **Issue 6**
- 33974 The following new requirements on POSIX implementations derive from alignment with the
- 33975 Single UNIX Specification:
- 33976 • Implementations are required to support at least ten *wfile* arguments in an editing command.
- 33977 The EXTENDED DESCRIPTION is changed to align with the IEEE P1003.2b draft standard.

## 33978 NAME

33979 sh — shell, the standard command language interpreter

## 33980 SYNOPSIS

33981 MAN sh [-abCefhimnuvx][-o option][+abCefhimnuvx][+o option]  
33982 [command\_file [argument...]]

33983 MAN sh -c[-abCefhimnuvx][-o option][+abCefhimnuvx][+o option]command\_string  
33984 [command\_name [argument...]]

33985 MAN sh -s[-abCefhimnuvx][-o option][+abCefhimnuvx][+o option][argument]

## 33986 DESCRIPTION

33987 The *sh* utility is a command language interpreter that shall execute commands read from a  
33988 command line string, the standard input, or a specified file. The application shall ensure that the  
33989 commands to be executed are expressed in the language described in Chapter 2 on page 35.

33990 MAN Path name expansion does not fail due to the size of a file.

33991 Shell input and output redirections have an implementation-dependent offset maximum that is  
33992 established in the open file description.

## 33993 OPTIONS

33994 The *sh* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
33995 Section 12.2, Utility Syntax Guidelines.

33996 The **-a**, **-b**, **-C**, **-e**, **-f**, **-m**, **-n**, **-o option**, **-u**, **-v**, and **-x** options are described as part of the *set*  
33997 MAN utility in Section 2.14 on page 96. The option letters derived from the *set* special built-in shall  
33998 also be accepted with a leading plus sign ('+') instead of a leading hyphen (meaning the reverse  
33999 case of the option as described in this volume of IEEE Std. 1003.1-200x).

34000 The following additional options shall be supported:

34001 **-c** Read commands from the *command\_string* operand. Set the value of special  
34002 parameter 0 (see Section 2.5.2 on page 43) from the value of the *command\_name*  
34003 operand and the positional parameters (\$1, \$2, and so on) in sequence from the  
34004 remaining *argument* operands. No commands shall be read from the standard  
34005 input.

34006 **-i** Specify that the shell is *interactive*; see below. An implementation may treat  
34007 specifying the **-i** option as an error if the real user ID of the calling process does  
34008 not equal the effective user ID or if the real group ID does not equal the effective  
34009 group ID.

34010 **-s** Read commands from the standard input.

34011 If there are no operands and the **-c** option is not specified, the **-s** option shall be assumed.

34012 If the **-i** option is present, or if there are no operands and the shell's standard input and standard  
34013 error are attached to a terminal, the shell is considered to be *interactive*.

## 34014 OPERANDS

34015 The following operands shall be supported:

34016 **-** A single hyphen is treated as the first operand and then ignored. If both '-' and  
34017 "—" are given as arguments, or if other operands precede the single hyphen, the  
34018 results are undefined.

34019 *argument* The positional parameters (\$1, \$2, and so on) shall be set to *arguments*, if any.

34020 *command\_file* The path name of a file containing commands. If the path name contains one or  
 34021 more slash characters, the implementation attempts to read that file; the file need  
 34022 not be executable. If the path name does not contain a slash character:

- 34023 • The implementation shall attempt to read that file from the current working  
 34024 directory; the file need not be executable.
- 34025 • If the file is not in the current working directory, the implementation may  
 34026 perform a search for an executable file using the value of *PATH*, as described in  
 34027 Section 2.9.1.1 on page 69.

34028 Special parameter 0 (see Section 2.5.2 on page 43) shall be set to the value of  
 34029 *command\_file*. If *sh* is called using a synopsis form that omits *command\_file*, special  
 34030 parameter 0 shall be set to the value of the first argument passed to *sh* from its  
 34031 parent (for example, *argv*[0] for a C program), which is normally a path name used  
 34032 to execute the *sh* utility.

34033 *command\_name*

34034 A string assigned to special parameter 0 when executing the commands in  
 34035 *command\_string*. If *command\_name* is not specified, special parameter 0 shall be set  
 34036 to the value of the first argument passed to *sh* from its parent (for example, *argv*[0]  
 34037 for a C program), which is normally a path name used to execute the *sh* utility.

34038 *command\_string*

34039 A string that shall be interpreted by the shell as one or more commands, as if the  
 34040 string were the argument to the *system()* function defined in the System Interfaces  
 34041 volume of IEEE Std. 1003.1-200x. If the *command\_string* operand is an empty string,  
 34042 *sh* shall exit with a zero exit status.

## 34043 STDIN

34044 The standard input shall be used only if one of the following is true:

- 34045 • The *-s* option is specified.
- 34046 • The *-c* option is not specified and no operands are specified.
- 34047 • The script executes one or more commands that require input from standard input (such as a  
 34048 *read* command that does not redirect its input).

34049 See the INPUT FILES section.

34050 When the shell is using standard input and it invokes a command that also uses standard input,  
 34051 the shell shall ensure that the standard input file pointer points directly after the command it has  
 34052 read when the command begins execution. It shall not read ahead in such a manner that any  
 34053 characters intended to be read by the invoked command are consumed by the shell (whether  
 34054 interpreted by the shell or not) or that characters that are not read by the invoked command are  
 34055 not seen by the shell. When the command expecting to read standard input is started  
 34056 asynchronously by an interactive shell, it is unspecified whether characters are read by the  
 34057 command or interpreted by the shell.

34058 If the standard input to *sh* is a FIFO or terminal device and is set to non-blocking reads, then *sh*  
 34059 shall enable blocking reads on standard input. This shall remain in effect when the command  
 34060 completes.

## 34061 INPUT FILES

34062 The input file shall be a text file, except that line lengths shall be unlimited. If the input file is  
 34063 empty or consists solely of blank lines or comments, or both, *sh* shall exit with a zero exit status.

## 34064 ENVIRONMENT VARIABLES

34065 The following environment variables shall affect the execution of *sh*:

34066 *ENV* This variable, when and only when an interactive shell is invoked, shall be  
 34067 subjected to parameter expansion (see Section 2.6.2 on page 51) by the shell, and  
 34068 the resulting value shall be used as a path name of a file containing shell  
 34069 commands to execute in the current environment. The file need not be executable.  
 34070 If the expanded value of *ENV* is not an absolute path name, the results are  
 34071 unspecified. *ENV* shall be ignored if the real and effective user IDs or real and  
 34072 effective group IDs of the user are different.

34073 *FCEDIT* This variable, when expanded by the shell, determines the default value for the *-e*  
 34074 *editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be used  
 34075 as the editor. This volume of IEEE Std. 1003.1-200x specifies the effects of this  
 34076 variable only for systems supporting the User Portability Utilities option.

34077 *HISTFILE* Determine a path name naming a command history file. If the *HISTFILE* variable is  
 34078 not set, the shell may attempt to access or create a file *.sh\_history* in the directory  
 34079 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 34080 and write access to, or create, the history file, it shall use an unspecified  
 34081 mechanism that allows the history to operate properly. (References to history  
 34082 "file" in this section shall be understood to mean this unspecified mechanism in  
 34083 such cases.) An implementation may choose to access this variable only when  
 34084 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 34085 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 34086 by the user, the file named by the *ENV* variable, or implementation-dependent  
 34087 system start-up files. (The initialization process for the history file can be  
 34088 dependent on the system start-up files, in that they may contain commands that  
 34089 effectively preempt the user's settings of *HISTFILE* and *HISTSIZE*. For example,  
 34090 function definition commands are recorded in the history file, unless the *set -o*  
 34091 *nolog* option is set. If the system administrator includes function definitions in  
 34092 some system start-up file called before the *ENV* file, the history file is initialized  
 34093 before the user gets a chance to influence its characteristics.) In some historical  
 34094 shells, the history file is initialized just after the *ENV* file has been processed.  
 34095 Therefore, it is implementation-dependent whether changes made to *HISTFILE*  
 34096 after the history file has been initialized are effective. Implementations may  
 34097 choose to disable the history list mechanism for users with appropriate privileges  
 34098 who do not set *HISTFILE*; the specific circumstances under which this occurs are  
 34099 implementation-dependent. If more than one instance of the shell is using the  
 34100 same history file, it is unspecified how updates to the history file from those shells  
 34101 interact. As entries are deleted from the history file, they shall be deleted oldest  
 34102 first. It is unspecified when history file entries are physically removed from the  
 34103 history file. This volume of IEEE Std. 1003.1-200x specifies the effects of this  
 34104 variable only for systems supporting the User Portability Utilities option.

34105 *HISTSIZE* Determine a decimal number representing the limit to the number of previous  
 34106 commands that are accessible. If this variable is unset, an unspecified default  
 34107 greater than or equal to 128 shall be used. The maximum number of commands in  
 34108 the history list is unspecified, but shall be at least 128. An implementation may  
 34109 choose to access this variable only when initializing the history file, as described  
 34110 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*  
 34111 after the history file has been initialized are effective.

34112 *HOME* Determine the path name of the user's home directory. The contents of *HOME* are  
 34113 used in Tilde Expansion as described in Section 2.6.1 on page 50. This volume of

|       |                    |                                                                                                            |
|-------|--------------------|------------------------------------------------------------------------------------------------------------|
| 34114 |                    | IEEE Std. 1003.1-200x specifies the effects of this variable only for systems                              |
| 34115 |                    | supporting the User Portability Utilities option.                                                          |
| 34116 | <i>IFS</i>         | <i>Input field separators</i> : a string treated as a list of characters that shall be used for            |
| 34117 |                    | field splitting and to split lines into words with the <i>read</i> command. See Section                    |
| 34118 |                    | 2.6.5 on page 58. If <i>IFS</i> is not set, the shell shall behave as if the value of <i>IFS</i> were      |
| 34119 |                    | the <space>, <tab>, and <newline> characters. Implementations may ignore the                               |
| 34120 |                    | value of <i>IFS</i> in the environment at the time <i>sh</i> is invoked, treating <i>IFS</i> as if it were |
| 34121 |                    | not set.                                                                                                   |
| 34122 | <i>LANG</i>        | Provide a default value for the internationalization variables that are unset or null.                     |
| 34123 |                    | If <i>LANG</i> is unset or null, the corresponding value from the implementation-                          |
| 34124 |                    | dependent default locale shall be used. If any of the internationalization variables                       |
| 34125 |                    | contains an invalid setting, the utility shall behave as if none of the variables had                      |
| 34126 |                    | been defined.                                                                                              |
| 34127 | <i>LC_ALL</i>      | If set to a non-empty string value, override the values of all the other                                   |
| 34128 |                    | internationalization variables.                                                                            |
| 34129 | <i>LC_COLLATE</i>  |                                                                                                            |
| 34130 |                    | Determine the behavior of range expressions, equivalence classes and multi-                                |
| 34131 |                    | character collating elements within pattern matching.                                                      |
| 34132 | <i>LC_CTYPE</i>    | Determine the locale for the interpretation of sequences of bytes of text data as                          |
| 34133 |                    | characters (for example, single-byte as opposed to multi-byte characters in                                |
| 34134 |                    | arguments and input files), which characters are defined as letters (character class                       |
| 34135 |                    | <b>alpha</b> ), and the behavior of character classes within pattern matching.                             |
| 34136 | <i>LC_MESSAGES</i> |                                                                                                            |
| 34137 |                    | Determine the locale that should be used to affect the format and contents of                              |
| 34138 |                    | diagnostic messages written to standard error.                                                             |
| 34139 | <i>MAIL</i>        | Determine a path name of the user's mailbox file for purposes of incoming mail                             |
| 34140 |                    | notification. If this variable is set, the shell shall inform the user if the file named by                |
| 34141 |                    | the variable is created or if its modification time has changed. Informing the user                        |
| 34142 |                    | shall be accomplished by writing a string of unspecified format to standard error                          |
| 34143 |                    | prior to the writing of the next primary prompt string after the completion of an                          |
| 34144 |                    | interval defined by the <i>MAILCHECK</i> variable. The user shall be informed only if                      |
| 34145 |                    | <i>MAIL</i> is set and <i>MAILPATH</i> is not set. This volume of IEEE Std. 1003.1-200x                    |
| 34146 |                    | specifies the effects of this variable only for systems supporting the User                                |
| 34147 |                    | Portability Utilities option.                                                                              |
| 34148 | <i>MAILCHECK</i>   |                                                                                                            |
| 34149 |                    | Establish a decimal integer value that specifies how often (in seconds) the shell                          |
| 34150 |                    | shall check for the arrival of mail in the files specified by the <i>MAILPATH</i> or <i>MAIL</i>           |
| 34151 |                    | variables. The default value shall be 600 seconds. If set to zero, the shell shall check                   |
| 34152 |                    | before issuing each primary prompt. This volume of IEEE Std. 1003.1-200x                                   |
| 34153 |                    | specifies the effects of this variable only for systems supporting the User                                |
| 34154 |                    | Portability Utilities option.                                                                              |
| 34155 | <i>MAILPATH</i>    | Provide a list of path names and optional messages separated by colons. If this                            |
| 34156 |                    | variable is set, the shell shall inform the user if any of the files named by the                          |
| 34157 |                    | variable are created or if any of their modification times change. (See the preceding                      |
| 34158 |                    | entry for <i>MAIL</i> for descriptions of mail arrival and user informing.) Each path                      |
| 34159 |                    | name can be followed by '%' and a string that shall be subjected to parameter                              |
| 34160 |                    | expansion and written to standard error when the modification time changes. If a                           |
| 34161 |                    | '%' character in the path name is preceded by a backslash, it shall be treated as a                        |

- 34162 literal ' % ' in the path name. The default message is unspecified.
- 34163 The *MAILPATH* environment variable takes precedence over the *MAIL* variable.
- 34164 This volume of IEEE Std. 1003.1-200x specifies the effects of this variable only for
- 34165 systems supporting the User Portability Utilities option.
- 34166 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 34167 **PATH** Establish a string formatted as described in the System Interface Definitions
- 34168 volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables, used to effect
- 34169 command interpretation; see Section 2.9.1.1 on page 69.
- 34170 **PWD** This variable shall represent an absolute path name of the current working
- 34171 directory. Assignments to this variable may be ignored unless the value is an
- 34172 absolute path name of the current working directory and there are no file name
- 34173 components of dot or dot-dot.
- 34174 **ASYNCHRONOUS EVENTS**
- 34175 Default.
- 34176 **STDOUT**
- 34177 See the **STDERR** section.
- 34178 **STDERR**
- 34179 Except as otherwise stated (by the descriptions of any invoked utilities or in interactive mode),
- 34180 standard error is used only for diagnostic messages.
- 34181 **OUTPUT FILES**
- 34182 None.
- 34183 **EXTENDED DESCRIPTION**
- 34184 See Chapter 2. The following additional capabilities are supported on systems supporting the
- 34185 User Portability Utilities option.
- 34186 **Command History List**
- 34187 When the *sh* utility is being used interactively, it shall maintain a list of commands previously
- 34188 entered from the terminal in the file named by the *HISTFILE* environment variable. The type,
- 34189 size, and internal format of this file are unspecified. Multiple *sh* processes can share access to the
- 34190 file for a user, if file access permissions allow this; see the description of the *HISTFILE*
- 34191 environment variable.
- 34192 **Command Line Editing**
- 34193 When *sh* is being used interactively from a terminal, the current command and the command
- 34194 history (see *fc* on page 470) can be edited using *vi*-mode command line editing. This mode uses
- 34195 commands, described below, similar to a subset of those described in the *vi* utility.
- 34196 Implementations may offer other command line editing modes corresponding to other editing
- 34197 utilities.
- 34198 The command *set -o vi* shall enable *vi*-mode editing and place *sh* into *vi* insert mode (see
- 34199 **Command Line Editing (vi-mode)** on page 893). This command also shall disable any other
- 34200 editing mode that the implementation may provide. The command *set +o vi* disables *vi*-mode
- 34201 editing.
- 34202 Certain block-mode terminals may be unable to support shell command line editing. If a
- 34203 terminal is unable to provide either edit mode, it need not be possible to *set -o vi* when using the
- 34204 shell on this terminal.

34205 In the following sections, the characters *erase*, *interrupt*, *kill*, and *end-of-file* are those set by the  
34206 *stty* utility.

### 34207 **Command Line Editing (vi-mode)**

34208 With *vi*-mode enabled, *sh* can be switched between insert mode and command mode.

34209 When in insert mode, an entered character shall be inserted into the command line, except as  
34210 noted in **vi Line Editing Insert Mode**. Upon entering *sh* and after termination of the previous  
34211 command, *sh* shall be in insert mode.

34212 Typing an escape character shall switch *sh* into command mode (see **vi Line Editing Command**  
34213 **Mode** on page 894). In command mode, an entered character shall either invoke a defined  
34214 operation, is used as part of a multi-character operation, or is treated as an error. A character that  
34215 is not recognized as part of an editing command shall terminate any specific editing command  
34216 and shall alert the terminal. Typing the *interrupt* character in command mode shall cause *sh* to  
34217 terminate command line editing on the current command line, reissue the prompt on the next  
34218 line of the terminal, and reset the command history (see *fc* on page 470) so that the most recently  
34219 executed command is the previous command (that is, the command that was being edited when  
34220 it was interrupted is not reentered into the history).

34221 In the following sections, the phrase “move the cursor to the beginning of the word” shall mean  
34222 “move the cursor to the first character of the current word” and the phrase “move the cursor to  
34223 the end of the word” shall mean “move the cursor to the last character of the current word”. The  
34224 phrase “beginning of the command line” indicates the point between the end of the prompt  
34225 string issued by the shell (or the beginning of the terminal line, if there is no prompt string) and  
34226 the first character of the command text.

### 34227 **vi Line Editing Insert Mode**

34228 While in insert mode, any character typed shall be inserted in the current command line, unless  
34229 it is from the following set.

34230 <newline> Execute the current command line being edited.

34231 *erase* Delete the character previous to the current cursor position and move the current  
34232 cursor position back one character. In insert mode, characters shall be erased from  
34233 both the screen and the buffer when backspacing.

34234 *interrupt* Terminate command line editing with the same effects as described for  
34235 interrupting command mode; see **Command Line Editing (vi-mode)**.

34236 *kill* Clear all the characters from the input line.

34237 <control>-V Insert the next character input, even if the character is otherwise a special insert  
34238 mode character.

34239 <control>-W Delete the characters from the one preceding the cursor to the preceding word  
34240 boundary. The word boundary in this case is the closer to the cursor of either the  
34241 beginning of the line or a character that is in neither the **blank** nor **punct** character  
34242 classification of the current locale.

34243 *end-of-file* Interpreted as the end of input in *sh*. This interpretation shall occur only at the  
34244 beginning of an input line. If *end-of-file* is entered other than at the beginning of the  
34245 line, the results are unspecified.

34246 <ESC> Place *sh* into command mode.

**vi Line Editing Command Mode**

In command mode for the command line editing feature, decimal digits not beginning with 0 that precede a command letter shall be remembered. Some commands use these decimal digits as a count number that affects the operation.

The term *motion command* represents one of the commands:

<space> 0 b F l W ^ \$ ; E f T w | , B e h t

Any command that modifies the current line shall cause a copy of the current line to be made at the end of the command history, the current line shall become that copy, and the edit is performed on that copy.

Any command that is preceded by *count* shall take a count (the numeric value of any preceding decimal digits). Unless otherwise noted, this count shall cause the specified operation to repeat by the number of times specified by the count. Also unless otherwise noted, a *count* that is out of range is considered an error condition and shall alert the terminal, but neither the cursor position, nor the command line, shall change.

The terms *word* and *bigword* are used as defined in the *vi* description. The term *save buffer* corresponds to the term *unnamed buffer* in *vi*.

The following commands shall be recognized in command mode:

<newline> Execute the current command line being edited.

<control>-L Redraw the current command line. Position the cursor at the same location on the new command line.

# Insert the character '#' at the beginning of the current command line and treat the current command line as a comment. This line shall be entered into the command history; see *fc* on page 470.

= Display the possible shell word expansions (see Section 2.6 on page 49) of the bigword at the current command line position. These expansions shall be displayed on subsequent terminal lines. If the bigword contains none of the characters '?', '\*', or '[', an asterisk('\*') shall be implicitly assumed at the end. If any directories are matched, these expansions shall have a '/' character appended. After the expansion, the line shall be redrawn, the cursor is repositioned at the current cursor position, and *sh* shall be placed in command mode.

\ Perform path name expansion (see Section 2.6.6 on page 59) on the current bigword, up to the largest set of characters that can be matched uniquely. If the bigword contains none of the characters '?', '\*', or '[', an asterisk('\*') shall be implicitly assumed at the end. This maximal expansion then shall replace the original bigword in the command line, and the cursor shall be placed after this expansion. If the resulting bigword completely and uniquely matches a directory, a '/' character shall be inserted directly after the bigword. If some other file is completely matched, a single <space> character shall be inserted after the bigword. After this operation, *sh* shall be placed in insert mode.

\* Perform path name expansion on the current bigword and insert all expansions into the command to replace the current bigword, with each expansion separated by a single <space> character. If at the end of the line, the current cursor position shall be moved to the first column position following the expansions and *sh* shall be placed in insert mode. Otherwise, the current cursor position shall be the last column position of the first character after the expansions and *sh* shall be placed in insert mode. If the current bigword contains none of the characters '?', '\*', or

|       |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 34293 |                             | ' [ ' , before the operation, an asterisk shall be implicitly assumed at the end.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 34294 | <b>@letter</b>              | Insert the value of the alias named <i>_letter</i> . The symbol <i>letter</i> represents a single alphabetic character from the portable character set; implementations may support additional characters as an extension. If the alias <i>_letter</i> contains other editing commands, these commands shall be performed as part of the insertion. If no alias <i>_letter</i> is enabled, this command shall have no effect.                                                                                                                                                                                                                                                                                                                       |
| 34295 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 34298 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 34299 | <b>[count]~</b>             | Convert, if the current character is a lowercase letter, to the equivalent uppercase letter and <i>vice versa</i> , as prescribed by the current locale. The current cursor position then shall be advanced by one character. If the cursor was positioned on the last character of the line, the case conversion shall occur, but the cursor shall not advance. If the ' ~ ' command is preceded by a <i>count</i> , that number of characters shall be converted, and the cursor shall be advanced to the character position after the last character converted. If the <i>count</i> is larger than the number of characters after the cursor, this shall not be considered an error; the cursor shall advance to the last character on the line. |

| 34308 | <b>[count].</b>             | Repeat the most recent non-motion command, even if it was executed on an earlier command line. If the previous command was preceded by a <i>count</i> , and no count is given on the ' . ' command, the count from the previous command shall be included as part of the repeated command. If the ' . ' command is preceded by a <i>count</i> , this shall override any <i>count</i> argument to the previous command. The <i>count</i> specified in the ' . ' command shall become the count for subsequent ' . ' commands issued without a count.                                                                                                                                                                                                 |

| 34315 | <b>[number]v</b>            | Invoke the <i>vi</i> editor to edit the current command line in a temporary file. When the editor exits, the commands in the temporary file shall be executed. If a <i>number</i> is prefixed to the command, it specifies the command number in the command history to be edited, rather than the current command line.                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 34413 |                       | If the <i>motion</i> command is the character 'c', the current command line shall be cleared and insert mode shall be entered. If the <i>motion</i> command would move the current cursor position toward the beginning of the command line, the character under the current cursor position shall not be deleted. If the motion command would move the current cursor position toward the end of the command line, the character under the current cursor position shall be deleted. If the <i>count</i> is larger than the number of characters between the current cursor position and the end of the command line toward which the motion command would move the cursor, this shall not be considered an error; all of the remaining characters in the aforementioned range shall be deleted and insert mode shall be entered. If the motion command is invalid, the terminal shall be alerted, the cursor shall not be moved, and no text shall be deleted. |

| 34453 |                       | Delete the characters between the current cursor position and the character position that would result from the <i>motion</i> command. A number <i>count</i> repeats the <i>motion</i> command <i>count</i> times. If the <i>motion</i> command would move toward the beginning of the command line, the character under the current cursor position shall not be deleted. If the <i>motion</i> command is <b>d</b> , the entire current command line shall be cleared. If the <i>count</i> is larger than the number of characters between the current cursor position and the end of the command line toward which the motion command would move the cursor, this shall not be considered an error; all of the remaining characters in the aforementioned range shall be deleted. The deleted characters shall be placed in the save buffer.                                              |

| 34465 | <b>[count]ymotion</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 34466 |                       | Yank (that is, copy) the characters from the current cursor position to the position resulting from the <i>motion</i> command into a save buffer. A number <i>count</i> shall be applied to the <i>motion</i> command. If the <i>motion</i> command would move toward the beginning of the command line, the character under the current cursor position shall not be included in the set of yanked characters. If the <i>motion</i> command is <b>y</b> , the entire current command line shall be yanked into the save buffer. The current cursor position shall be unchanged. If the <i>count</i> is larger than the number of characters between the current cursor position and the end of the command line toward which the motion command would move the cursor, this shall not be considered an error; all of the remaining characters in the aforementioned range shall be yanked. |

| 34524 | <b>N</b>                      | Repeat the most recent / or ? command, reversing the direction of the search.                                                                                                                                                                                  |

34525 **EXIT STATUS**

34526 The following exit values shall be returned:

- 34527           0    The script to be executed consisted solely of zero or more blank lines or comments, or  
 34528                both.  
 34529        1-125    A non-interactive shell detected a syntax, redirection or variable assignment error.  
 34530        127    A specified *command\_file* could not be found by a non-interactive shell.

34531           Otherwise, the shell shall return the exit status of the last command it invoked or attempted to  
 34532           invoke (see also the *exit* utility in Section 2.14 on page 96).

34533 **CONSEQUENCES OF ERRORS**

34534 See Section 2.8.1 on page 65.

34535 **APPLICATION USAGE**

34536           Standard input and standard error are the files that determine whether a shell is interactive  
 34537           when **-i** is not specified. For example:

34538 `sh > file`

34539 and:

34540 `sh 2> file`

34541           create interactive and non-interactive shells, respectively. Although both accept terminal input,  
 34542           the results of error conditions are different, as described in Section 2.8.1 on page 65; in the second  
 34543           example a redirection error encountered by a special built-in utility aborts the shell.

34544           On systems that support set-user-ID scripts, a historical trapdoor has been to link a script to the  
 34545           name **-i**. When it is called by a sequence such as:

34546 `sh -`

34547 or by:

34548 `#! /bin/sh -`

34549           the historical systems have assumed that no option letters follow. Thus, this volume of  
 34550           IEEE Std. 1003.1-200x allows the single hyphen to mark the end of the options, in addition to the  
 34551           use of the regular `"—"` argument, because the older practice is so pervasive.

34552           A portable application must protect its first operand, if it starts with a plus sign, by preceding it  
 34553           with the `"—"` argument that denotes the end of the options.

34554 **EXAMPLES**

- 34555           1. Execute a shell command from a string:

34556 `sh -c "cat myfile"`

- 34557           2. Execute a shell script from a file in the current directory:

34558 `sh my_shell_cmds`34559 **RATIONALE**34560 The *sh* utility and the *set* special built-in utility share a common set of options.

34561           The KornShell ignores the contents of *IFS* upon entry to the script. A conforming application  
 34562           cannot rely on importing *IFS*. One justification for this, beyond security considerations, is to  
 34563           assist possible future shell compilers. Allowing *IFS* to be imported from the environment  
 34564           prevents many optimizations that might otherwise be performed via dataflow analysis of the  
 34565           script itself.

34566 The text in the STDIN section about non-blocking reads concerns an instance of *sh* that has been  
34567 invoked, probably by a C-language program, with standard input that has been opened using  
34568 the `O_NONBLOCK` flag; see *open()* in the System Interfaces volume of IEEE Std. 1003.1-200x. If  
34569 the shell did not reset this flag, it would immediately terminate because no input data would be  
34570 available yet and that would be considered the same as end-of-file.

34571 The options associated with a *restricted shell* (command name *rsh* and the `-r` option) were  
34572 excluded because the standard developers considered that the implied level of security could  
34573 not be achieved and they did not want to raise false expectations.

34574 On systems that support set-user-ID scripts, a historical trapdoor has been to link a script to the  
34575 name `-i`. When it is called by a sequence such as *sh -* or by `#!/bin/sh -`, the historical systems  
34576 have assumed that no option letters follow. Thus, this volume of IEEE Std. 1003.1-200x allows  
34577 the single hyphen to mark the end of the options, in addition to the use of the regular `"—"`  
34578 argument, because it was considered that the older practice was so pervasive. An alternative  
34579 approach is taken by the KornShell, where real and effective user/group IDs must match for an  
34580 interactive shell; this behavior is specifically allowed by this volume of IEEE Std. 1003.1-200x.

34581 **Note:** There are other problems with set-user-ID scripts that the two approaches described  
34582 here do not resolve.

34583 The default messages for the various *MAIL*-related messages are unspecified because they vary  
34584 across implementations. Typical messages are:

34585 "you have mail\n"

34586 or:

34587 "you have new mail\n"

34588 It is important that the descriptions of command line editing refer to the same shell as that in the  
34589 base standard so that interactive users can also be application programmers without having to  
34590 deal with programmatic differences in their two environments. It is also essential that the utility  
34591 name *sh* be specified because this explicit utility name is too firmly rooted in historical practice  
34592 of application programs for it to change.

34593 Consideration was given to mandating a diagnostic message when attempting to set *vi*-mode on  
34594 terminals that do not support command line editing. However, it is not historical practice for the  
34595 shell to be cognizant of all terminal types and thus be able to detect inappropriate terminals in  
34596 all cases. Implementations are encouraged to supply diagnostics in this case whenever possible,  
34597 rather than leaving the user in a state where editing commands work incorrectly.

34598 In early proposals, the KornShell-derived *emacs* mode of command line editing was included,  
34599 even though the *emacs* editor itself was not. The community of *emacs* proponents was adamant  
34600 that the full *emacs* editor not be included in this volume of IEEE Std. 1003.1-200x because they  
34601 were concerned that an attempt to standardize this very powerful environment would  
34602 encourage vendors to ship versions conforming strictly to this volume of IEEE Std. 1003.1-200x,  
34603 but lacking the extensibility required by the community. The author of the original *emacs*  
34604 program also expressed his desire to omit the program. Furthermore, there were a number of  
34605 historical systems that did not include *emacs*, or included it without supporting it, but there were  
34606 very few that did not include and support *vi*. The shell *emacs* command line editing mode was  
34607 finally omitted from this volume of IEEE Std. 1003.1-200x because it became apparent that the  
34608 KornShell version and the editor being distributed with the GNU system had diverged in some  
34609 respects. The author of *emacs* requested that the POSIX *emacs* mode either be deleted or have a  
34610 significant number of unspecified conditions. Although the KornShell author agreed to consider  
34611 changes to bring the shell into alignment, the standard developers decided to defer specification  
34612 at this time, rather than attempting to agree on a specific subset of *emacs* late within the

34613 development of this volume of IEEE Std. 1003.1-200x. It is assumed that the *emacs* and KornShell  
 34614 developers will converge on a definition acceptable to both groups, and this may be used as a  
 34615 model for a future version of this volume of IEEE Std. 1003.1-200x. In the interim,  
 34616 implementations are free to offer additional command line editing modes based on the exact  
 34617 models of editors their users are most comfortable with.

34618 Early proposals had the following list entry in **vi Line Editing Insert Mode** on page 893:

34619 \ If followed by the *erase* or *kill* character, that character shall be inserted into the input line.  
 34620 Otherwise, the backslash itself shall be inserted into the input line.

34621 However, this is not actually a feature of *sh* command line editing insert mode, but one of some  
 34622 historical terminal line drivers. Some conforming implementations continue to do this when the  
 34623 *stty ixtextn* flag is set.

#### 34624 FUTURE DIRECTIONS

34625 None.

#### 34626 SEE ALSO

34627 *cd*, *echo*, *pwd*, *test*, *umask*, the System Interfaces volume of IEEE Std. 1003.1-200x, *dup()*, *exec*,  
 34628 *exit()*, *fork()*, *pipe()*, *signal()*, *system()*, *ulimit()*, *umask()*, *wait()*

#### 34629 CHANGE HISTORY

34630 First released in Issue 2.

#### 34631 Issue 4

34632 Aligned with the ISO/IEC 9945-2: 1993 standard.

34633 Description of the shell command language and special built-ins moved to Chapter 2 on page 35.

#### 34634 Issue 5

34635 FUTURE DIRECTIONS section added.

34636 Text is added to the DESCRIPTION for the Large File Summit proposal.

#### 34637 Issue 6

34638 The Open Group corrigenda item U029/2 has been applied, correcting the second SYNOPSIS.

34639 The Open Group corrigenda item U027/3 has been applied, correcting a typographical error.

34640 The following new requirements on POSIX implementations derive from alignment with the  
 34641 Single UNIX Specification:

34642 • The option letters derived from the set special built-in are also accepted with a leading plus  
 34643 sign (' + ').

34644 • Large file extensions are added:

34645 — Path name expansion does not fail due to the size of a file.

34646 — Shell input and output redirections have an implementation-dependent offset maximum  
 34647 that is established in the open file description.

34648 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to  
 34649 “directory referred to by the *HOME* environment variable”.

34650 Descriptions for the *ENV* and *PWD* environment variables are included to align with the  
 34651 IEEE P1003.2b draft standard.

34652 The normative text is reworded to avoid use of the term “must” for application requirements.

34653 **NAME**

34654           sleep — suspend execution for an interval

34655 **SYNOPSIS**34656           sleep *time*34657 **DESCRIPTION**34658           The *sleep* utility shall suspend execution for at least the integral number of seconds specified by  
34659           the *time* operand.34660 **OPTIONS**

34661           None.

34662 **OPERANDS**

34663           The following operand shall be supported:

34664           *time*           A non-negative decimal integer specifying the number of seconds for which to  
34665                               suspend execution.34666 **STDIN**

34667           Not used.

34668 **INPUT FILES**

34669           None.

34670 **ENVIRONMENT VARIABLES**34671           The following environment variables shall affect the execution of *sleep*:34672           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
34673                               If *LANG* is unset or null, the corresponding value from the implementation-  
34674                               dependent default locale shall be used. If any of the internationalization variables  
34675                               contains an invalid setting, the utility shall behave as if none of the variables had  
34676                               been defined.34677           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
34678                               internationalization variables.34679           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
34680                               characters (for example, single-byte as opposed to multi-byte characters in  
34681                               arguments).34682           *LC\_MESSAGES*34683                               Determine the locale that should be used to affect the format and contents of  
34684                               diagnostic messages written to standard error.34685 *XSI*           *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.34686 **ASYNCHRONOUS EVENTS**34687           If the *sleep* utility receives a SIGALRM signal, one of the following actions shall be taken:

- 34688           1. Terminate normally with a zero exit status.
- 
- 34689           2. Effectively ignore the signal.
- 
- 34690           3. Provide the default behavior for signals described in the ASYNCHRONOUS EVENTS
- 
- 34691                               section of Section 1.11 on page 25. This could include terminating with a non-zero exit
- 
- 34692                               status.

34693           The *sleep* utility shall take the standard action for all other signals.

34694 **STDOUT**

34695 Not used.

34696 **STDERR**

34697 Used only for diagnostic messages.

34698 **OUTPUT FILES**

34699 None.

34700 **EXTENDED DESCRIPTION**

34701 None.

34702 **EXIT STATUS**

34703 The following exit values shall be returned:

34704       0 The execution was successfully suspended for at least *time* seconds, or a SIGALRM signal  
34705       was received. See the ASYNCHRONOUS EVENTS section.

34706       &gt;0 An error occurred.

34707 **CONSEQUENCES OF ERRORS**

34708 Default.

34709 **APPLICATION USAGE**

34710 None.

34711 **EXAMPLES**34712 The *sleep* utility can be used to execute a command after a certain amount of time, as in:34713 (sleep 105; *command*) &

34714 or to execute a command every so often, as in:

34715 while true

34716 do

34717       *command*

34718       sleep 37

34719 done

34720 **RATIONALE**

34721 The exit status is allowed to be zero when *sleep* is interrupted by the SIGALRM signal because  
34722 most implementations of this utility rely on the arrival of that signal to notify them that the  
34723 requested finishing time has been successfully attained. Such implementations thus do not  
34724 distinguish this situation from the successful completion case. Other implementations are  
34725 allowed to catch the signal and go back to sleep until the requested time expires or to provide  
34726 the normal signal termination procedures.

34727 As with all other utilities that take integral operands and do not specify subranges of allowed  
34728 values, *sleep* is required by this volume of IEEE Std. 1003.1-200x to deal with *time* requests of up  
34729 to 2 147 483 647 seconds. This may mean that some implementations have to make multiple calls  
34730 to the delay mechanism of the underlying operating system if its argument range is less than  
34731 this.

34732 **FUTURE DIRECTIONS**

34733 None.

34734 **SEE ALSO**34735 *wait*, the System Interfaces volume of IEEE Std. 1003.1-200x, *alarm()*, *sleep()*

34736 **CHANGE HISTORY**

34737 First released in Issue 2.

34738 **Issue 4**

34739 Aligned with the ISO/IEC 9945-2: 1993 standard.

## 34740 NAME

34741        `sort` — sort, merge, or sequence check text files

## 34742 SYNOPSIS

34743        `sort [-m][-o output][-bdfinru][-t char][-k keydef]... [file...]`

34744        `sort -c [-bdfinru][-t char][-k keydef]... [file...]`

## 34745 DESCRIPTION

34746        The *sort* utility shall perform one of the following functions:

- 34747        1. Sort lines of all the named files together and write the result to the specified output.
- 34748        2. Merge lines of all the named (presorted) files together and write the result to the specified  
34749        output.
- 34750        3. Check that a single input file is correctly presorted.

34751        Comparisons shall be based on one or more sort keys extracted from each line of input (or the  
34752        entire line if no sort keys are specified), and shall be performed using the collating sequence of  
34753        the current locale.

## 34754 OPTIONS

34755        The *sort* utility shall conform to the System Interface Definitions volume of  
34756        IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines, and the `-k keydef` option should  
34757        follow the `-b`, `-d`, `-f`, `-i`, `-n`, and `-r` options.

34758        The following options shall be supported:

- |                         |                         |                                                                                                                                                                                                                         |
|-------------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 34759<br>34760<br>34761 | <b>-c</b>               | Check that the single input file is ordered as specified by the arguments and the collating sequence of the current locale. No output shall be produced; only the exit code shall be affected.                          |
| 34762                   | <b>-m</b>               | Merge only; the input file shall be assumed to be already sorted.                                                                                                                                                       |
| 34763<br>34764          | <b>-o <i>output</i></b> | Specify the name of an output file to be used instead of the standard output. This file can be the same as one of the input <i>files</i> .                                                                              |
| 34765<br>34766<br>34767 | <b>-u</b>               | Unique: suppress all but one in each set of lines having equal keys. If used with the <code>-c</code> option, check that there are no lines with duplicate keys, in addition to checking that the input file is sorted. |

34768        The following options shall override the default ordering rules. When ordering options appear  
34769        independent of any key field specifications, the requested field ordering rules shall be applied  
34770        globally to all sort keys. When attached to a specific key (see `-k`), the specified ordering options  
34771        shall override all global ordering options for that key.

- |                         |           |                                                                                                                                                                                                                                                                 |
|-------------------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 34772<br>34773<br>34774 | <b>-d</b> | Specify that only <blank> characters and alphanumeric characters, according to the current setting of <i>LC_CTYPE</i> , shall be significant in comparisons. The behavior is undefined for a sort key to which <code>-i</code> or <code>-n</code> also applies. |
| 34775<br>34776<br>34777 | <b>-f</b> | Consider all lowercase characters that have uppercase equivalents, according to the current setting of <i>LC_CTYPE</i> , to be the uppercase equivalent for the purposes of comparison.                                                                         |
| 34778<br>34779          | <b>-i</b> | Ignore all characters that are non-printable, according to the current setting of <i>LC_CTYPE</i> .                                                                                                                                                             |
| 34780<br>34781<br>34782 | <b>-n</b> | Restrict the sort key to an initial numeric string, consisting of optional <blank> characters, optional minus sign, and zero or more digits with an optional radix character and thousands separators (as defined in the current locale), which shall           |

34783 be sorted by arithmetic value. An empty digit string shall be treated as zero.  
 34784 Leading zeros and signs on zeros shall not affect ordering.

34785 **-r** Reverse the sense of comparisons.

34786 The treatment of field separators can be altered using the options:

34787 **-b** Ignore leading <blank> characters when determining the starting and ending  
 34788 positions of a restricted sort key. If the **-b** option is specified before the first **-k**  
 34789 option, it shall be applied to all **-k** options. Otherwise, the **-b** option can be  
 34790 attached independently to each **-k** *field\_start* or *field\_end* option-argument (see  
 34791 below).

34792 **-t char** Use *char* as the field separator character; *char* shall not be considered to be part of a  
 34793 field (although it can be included in a sort key). Each occurrence of *char* shall be  
 34794 significant (for example, <*char*><*char*> delimits an empty field). If **-t** is not  
 34795 specified, <blank> characters shall be used as default field separators; each  
 34796 maximal non-empty sequence of <blank> characters that follows a non-<blank>  
 34797 character shall be a field separator.

34798 Sort keys can be specified using the options:

34799 **-k keydef** The *keydef* argument is a restricted sort key field definition. The format of this  
 34800 definition is:

34801 *field\_start*[*type*][,*field\_end*[*type*]]

34802 where *field\_start* and *field\_end* define a key field restricted to a portion of the line  
 34803 (see the EXTENDED DESCRIPTION section), and *type* is a modifier from the list of  
 34804 characters 'b', 'd', 'f', 'i', 'n', 'r'. The 'b' modifier shall behave like the  
 34805 **-b** option, but applies only to the *field\_start* or *field\_end* to which it is attached. The  
 34806 other modifiers shall behave like the corresponding options, but shall apply only  
 34807 to the key field to which they are attached; they shall have this effect if specified  
 34808 with *field\_start*, *field\_end*, or both. If any modifier is attached to a *field\_start* or to a  
 34809 *field\_end*, no option shall apply to either. Implementations shall support at least  
 34810 nine occurrences of the **-k** option, which shall be significant in command line  
 34811 order. If no **-k** option is specified, a default sort key of the entire line shall be used.

34812 When there are multiple key fields, later keys shall be compared only after all  
 34813 earlier keys compare equal. Except when the **-u** option is specified, lines that  
 34814 otherwise compare equal shall be ordered as if none of the options **-d**, **-f**, **-i**, **-n**, or  
 34815 **-k** were present (but with **-r** still in effect, if it was specified) and with all bytes in  
 34816 the lines significant to the comparison. The order in which lines that still compare  
 34817 equal are written is unspecified.

34818 **OPERANDS**

34819 The following operand shall be supported:

34820 *file* A path name of a file to be sorted, merged, or checked. If no *file* operands are  
 34821 specified, or if a *file* operand is '-', the standard input shall be used.

34822 **STDIN**

34823 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 34824 See the INPUT FILES section.

34825 **INPUT FILES**

34826 The input files shall be text files, except that the *sort* utility shall add a <newline> character to  
 34827 the end of a file ending with an incomplete last line.

34828 **ENVIRONMENT VARIABLES**

34829 The following environment variables shall affect the execution of *sort*:

34830 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 34831 If *LANG* is unset or null, the corresponding value from the implementation-  
 34832 dependent default locale shall be used. If any of the internationalization variables  
 34833 contains an invalid setting, the utility shall behave as if none of the variables had  
 34834 been defined.

34835 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 34836 internationalization variables.

34837 *LC\_COLLATE*  
 34838 Determine the locale for ordering rules.

34839 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 34840 characters (for example, single-byte as opposed to multi-byte characters in  
 34841 arguments and input files) and the behavior of character classification for the *-b*,  
 34842 *-d*, *-f*, *-i*, and *-n* options.

34843 *LC\_MESSAGES*  
 34844 Determine the locale that should be used to affect the format and contents of  
 34845 diagnostic messages written to standard error.

34846 *LC\_NUMERIC*  
 34847 Determine the locale for the definition of the radix character and thousands  
 34848 separator for the *-n* option.

34849 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

34850 **ASYNCHRONOUS EVENTS**

34851 Default.

34852 **STDOUT**

34853 Unless the *-o* or *-c* options are in effect, the standard output shall contain the sorted input.

34854 **STDERR**

34855 Used for diagnostic messages. A warning message about correcting an incomplete last line of an  
 34856 input file may be generated, but need not affect the final exit status.

34857 **OUTPUT FILES**

34858 If the *-o* option is in effect, the sorted input shall be placed in the file *output*.

34859 **EXTENDED DESCRIPTION**

34860 The notation:

34861 *-k field\_start[type][,field\_end[type]]*

34862 shall define a key field that begins at *field\_start* and ends at *field\_end* inclusive, unless *field\_start*  
 34863 falls beyond the end of the line or after *field\_end*, in which case the key field is empty. A missing  
 34864 *field\_end* shall mean the last character of the line.

34865 A field comprises a maximal sequence of non-separating characters and, in the absence of option  
 34866 *-t*, any preceding field separator.

34867 The *field\_start* portion of the *keydef* option-argument shall have the form:

34868 *field\_number*[*.first\_character*]

34869 Fields and characters within fields shall be numbered starting with 1. The *field\_number* and  
 34870 *first\_character* pieces, interpreted as positive decimal integers, shall specify the first character to  
 34871 be used as part of a sort key. If *.first\_character* is omitted, it shall refer to the first character of the  
 34872 field.

34873 The *field\_end* portion of the *keydef* option-argument shall have the form:

34874 *field\_number*[*.last\_character*]

34875 The *field\_number* shall be as described above for *field\_start*. The *last\_character* piece, interpreted  
 34876 as a non-negative decimal integer, shall specify the last character to be used as part of the sort  
 34877 key. If *last\_character* evaluates to zero or *.last\_character* is omitted, it shall refer to the last  
 34878 character of the field specified by *field\_number*.

34879 If the **-b** option or **b** type modifier is in effect, characters within a field shall be counted from the  
 34880 first non-<blank> character in the field. (This shall apply separately to *first\_character* and  
 34881 *last\_character*.)

## 34882 EXIT STATUS

34883 The following exit values shall be returned:

34884     0 All input files were output successfully, or **-c** was specified and the input file was correctly  
 34885 sorted.

34886     1 Under the **-c** option, the file was not ordered as specified, or if the **-c** and **-u** options were  
 34887 both specified, two input lines were found with equal keys.

34888     >1 An error occurred.

## 34889 CONSEQUENCES OF ERRORS

34890 Default.

## 34891 APPLICATION USAGE

34892 The default value for **-t**, <blank> character, has different properties from, for example, **-t**  
 34893 "<space>". If a line contains:

34894 <space><space>foo

34895 the following treatment would occur with default separation as opposed to specifically selecting  
 34896 a <space> character:

| Field | Default           | <b>-t</b> "<space>" |
|-------|-------------------|---------------------|
| 1     | <space><space>foo | <i>empty</i>        |
| 2     | <i>empty</i>      | <i>empty</i>        |
| 3     | <i>empty</i>      | foo                 |

34901 The leading field separator itself is included in a field when **-t** is not used. For example, this  
 34902 command returns an exit status of zero, meaning the input was already sorted:

34903 sort -c -k 2 <<eof

34904 y<tab>b

34905 x<space>a

34906 eof

34907 (assuming that a <tab> character precedes the <space> character in the current collating  
 34908 sequence). The field separator is not included in a field when it is explicitly set via **-t**. This is  
 34909 historical practice and allows usage such as:

```

34910 sort -t "|" -k 2n <<eof
34911 Atlanta|425022|Georgia
34912 Birmingham|284413|Alabama
34913 Columbia|100385|South Carolina
34914 eof

```

34915 where the second field can be correctly sorted numerically without regard to the non-numeric  
 34916 field separator.

34917 The wording in the OPTIONS section clarifies that the **-b**, **-d**, **-f**, **-i**, **-n**, and **-r** options have to  
 34918 come before the first sort key specified if they are intended to apply to all specified keys. The  
 34919 way it is described in this volume of IEEE Std. 1003.1-200x matches historical practice, not  
 34920 historical documentation. In the non-obsolescent versions, the results are unspecified if these  
 34921 options are specified after a **-k** option.

34922 The **-f** option might not work as expected in locales where there is not a one-to-one mapping  
 34923 between an uppercase and a lowercase letter.

#### 34924 EXAMPLES

- 34925 1. The following command sorts the contents of **infile** with the second field as the sort key:  
 34926 

```
sort -k 2,2 infile
```
- 34927 2. The following command sorts, in reverse order, the contents of **infile1** and **infile2**, placing  
 34928 the output in **outfile** and using the second character of the second field as the sort key  
 34929 (assuming that the first character of the second field is the field separator):  
 34930 

```
sort -r -o outfile -k 2.2,2.2 infile1 infile2
```
- 34931 3. The following command sorts the contents of **infile1** and **infile2** using the second non-  
 34932 <blank> character of the second field as the sort key:  
 34933 

```
sort -k 2.2b,2.2b infile1 infile2
```
- 34934 4. The following command prints the System V password file (user database) sorted by the  
 34935 numeric user ID (the third colon-separated field):  
 34936 

```
sort -t : -k 3,3n /etc/passwd
```
- 34937 5. The following command prints the lines of the already sorted file **infile**, suppressing all  
 34938 but one occurrence of lines having the same third field:  
 34939 

```
sort -um -k 3.1,3.0 infile
```

#### 34940 RATIONALE

34941 Examples in some historical documentation state that options **-um** with one input file keep the  
 34942 first in each set of lines with equal keys. This behavior was deemed to be an implementation  
 34943 artifact and was not standardized.

34944 The **-z** option was omitted; it is not standard practice on most systems and is inconsistent with  
 34945 using *sort* to sort several files individually and then merge them together. The text concerning **-z**  
 34946 in historical documentation appeared to require implementations to determine the proper buffer  
 34947 length during the sort phase of operation, but not during the merge.

34948 The **-y** option was omitted because of non-portability. The **-M** option, present in System V, was  
 34949 omitted because of non-portability in international usage.

34950 An undocumented **-T** option exists in some implementations. It is used to specify a directory for  
 34951 intermediate files. Implementations are encouraged to support the use of the *TMPCDIR*  
 34952 environment variable instead of adding an option to support this functionality.

34953 The **-k** option was added to satisfy two objections. First, the zero-based counting used by *sort* is  
34954 not consistent with other utility conventions. Second, it did not meet syntax guideline  
34955 requirements.

34956 Historical documentation indicates that “setting **-n** implies **-b**”. The description of **-n** already  
34957 states that optional leading <blank>s are tolerated in doing the comparison. If **-b** is enabled,  
34958 rather than implied, by **-n**, this has unusual side effects. When a character offset is used in a  
34959 column of numbers (for example, to sort modulo 100), that offset is measured relative to the  
34960 most significant digit, not to the column. Based upon a recommendation from the author of the  
34961 original *sort* utility, the **-b** implication has been omitted from this volume of  
34962 IEEE Std. 1003.1-200x, and an application wishing to achieve the previously mentioned side  
34963 effects has to code the **-b** flag manually.

#### 34964 **FUTURE DIRECTIONS**

34965 None.

#### 34966 **SEE ALSO**

34967 *comm*, *join*, *uniq*, the System Interfaces volume of IEEE Std. 1003.1-200x, *toupper()*

#### 34968 **CHANGE HISTORY**

34969 First released in Issue 2.

#### 34970 **Issue 4**

34971 Aligned with the ISO/IEC 9945-2:1993 standard.

## 34972 NAME

34973 split — split files into pieces

## 34974 SYNOPSIS

34975 UP `split [-l line_count][-a suffix_length][file[name]]`34976 `split -b n[k|m][-a suffix_length][file[name]]`

34977

## 34978 DESCRIPTION

34979 The *split* utility shall read an input file and write one or more output files. The default size of  
 34980 each output file shall be 1 000 lines. The size of the output files can be modified by specification  
 34981 of the **-b** or **-l** options. Each output file shall be created with a unique suffix. The suffix shall  
 34982 consist of exactly *suffix\_length* lowercase letters from the POSIX locale. The letters of the suffix  
 34983 shall be used as if they were a base-26 digit system, with the first suffix to be created consisting  
 34984 of all 'a' characters, the second with a 'b' replacing the last 'a', and so on, until a name of all  
 34985 'z' characters is created. By default, the names of the output files shall be 'x', followed by a  
 34986 two-character suffix from the character set as described above, starting with "aa", "ab", "ac",  
 34987 and so on, and continuing until the suffix "zz", for a maximum of 676 files.

34988 If the number of files required exceeds the maximum allowed by the suffix length provided,  
 34989 such that the last allowable file would be larger than the requested size, the *split* utility shall fail  
 34990 after creating the last file with a valid suffix; *split* shall not delete the files it created with valid  
 34991 suffixes. If the file limit is not exceeded, the last file created shall contain the remainder of the  
 34992 input file, and may be smaller than the requested size.

## 34993 OPTIONS

34994 The *split* utility shall conform to the System Interface Definitions volume of  
 34995 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

34996 The following options shall be supported:

34997 **-a *suffix\_length***

34998 Use *suffix\_length* letters to form the suffix portion of the file names of the split file.  
 34999 If **-a** is not specified, the default suffix length shall be two. If the sum of the *name*  
 35000 operand and the *suffix\_length* option-argument would create a file name exceeding  
 35001 {NAME\_MAX} bytes, an error shall result; *split* shall exit with a diagnostic  
 35002 message and no files shall be created.

35003 **-b *n*** Split a file into pieces *n* bytes in size.

35004 **-b *nk*** Split a file into pieces *n*\*1024 bytes in size.

35005 **-b *nm*** Split a file into pieces *n*\*1 048 576 bytes in size.

35006 **-l *line\_count*** Specify the number of lines in each resulting file piece. The *line\_count* argument is  
 35007 an unsigned decimal integer. The default is 1 000. If the input does not end with a  
 35008 <newline> character, the partial line shall be included in the last output file.

## 35009 OPERANDS

35010 The following operands shall be supported:

35011 *file* The path name of the ordinary file to be split. If no input file is given or *file* is '-',  
 35012 the standard input shall be used.

35013 *name* The prefix to be used for each of the files resulting from the split operation. If no  
 35014 *name* argument is given, 'x' shall be used as the prefix of the output files. The  
 35015 combined length of the basename of *prefix* and *suffix\_length* cannot exceed  
 35016 {NAME\_MAX} bytes. See the OPTIONS section.

35017 **STDIN**

35018 See the INPUT FILES section.

35019 **INPUT FILES**

35020 Any file can be used as input.

35021 **ENVIRONMENT VARIABLES**35022 The following environment variables shall affect the execution of *split*:

35023 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 35024 If *LANG* is unset or null, the corresponding value from the implementation-  
 35025 dependent default locale shall be used. If any of the internationalization variables  
 35026 contains an invalid setting, the utility shall behave as if none of the variables had  
 35027 been defined.

35028 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 35029 internationalization variables.

35030 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 35031 characters (for example, single-byte as opposed to multi-byte characters in  
 35032 arguments and input files).

35033 *LC\_MESSAGES*

35034 Determine the locale that should be used to affect the format and contents of  
 35035 diagnostic messages written to standard error.

35036 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

35037 **ASYNCHRONOUS EVENTS**

35038 Default.

35039 **STDOUT**

35040 Not used.

35041 **STDERR**

35042 Used only for diagnostic messages.

35043 **OUTPUT FILES**

35044 The output files contain portions of the original input file; otherwise, unchanged.

35045 **EXTENDED DESCRIPTION**

35046 None.

35047 **EXIT STATUS**

35048 The following exit values shall be returned:

35049 0 Successful completion.

35050 &gt;0 An error occurred.

35051 **CONSEQUENCES OF ERRORS**

35052 Default.

**35053 APPLICATION USAGE**

35054 Application writers should note that this utility need not be provided on systems that do not  
35055 support the User Portability Utilities option.

**35056 EXAMPLES**

35057 In the following examples **foo** is a text file that contains 5 000 lines.

35058 1. Create five files, **xaa**, **xab**, **xac**, **xad**, and **xae**:

35059 `split foo`

35060 2. Create five files, but the suffixed portion of the created files consists of three letters, **xaaa**,  
35061 **xaab**, **xaac**, **xaad**, and **xaae**:

35062 `split -a 3 foo`

35063 3. Create three files with four-letter suffixes and a supplied prefix, **bar\_aaaa**, **bar\_aaab**, and  
35064 **bar\_aaac**:

35065 `split -a 4 -l 2000 foo bar_`

35066 4. Create as many files as are necessary to contain at most 20\*1 024 bytes, each with the  
35067 default prefix of **x** and a five-letter suffix:

35068 `split -a 5 -b 20k foo`

**35069 RATIONALE**

35070 The **-b** option was added to provide a mechanism for splitting files other than by lines. While  
35071 most uses of the **-b** option are for transmitting files over networks, some believed it would have  
35072 additional uses.

35073 The **-a** option was added to overcome the limitation of being able to create only 676 files.

35074 Consideration was given to deleting this utility, using the rationale that the function provided  
35075 by this utility is available via the *csplit* utility (see *csplit* on page 314). Upon reconsideration of  
35076 the purpose of the User Portability Extension, it was decided to retain both this utility and the  
35077 *csplit* utility because users use both utilities and have historical expectations of their behavior.  
35078 Furthermore, the splitting on byte boundaries in *split* cannot be duplicated with the historical  
35079 *csplit*.

35080 The text “*split* shall not delete the files it created with valid suffixes” would normally be  
35081 assumed, but since the related utility, *csplit*, does delete files under some circumstances, the  
35082 historical behavior of *split* is made explicit to avoid misinterpretation.

**35083 FUTURE DIRECTIONS**

35084 None.

**35085 SEE ALSO**

35086 *csplit*

**35087 CHANGE HISTORY**

35088 First released in Issue 2.

**35089 Issue 4**

35090 Aligned with the ISO/IEC 9945-2: 1993 standard.

**35091 Issue 6**

35092 This utility is now marked as part of the User Portability Utilities option.

35093 The APPLICATION USAGE section is added.

35094

The obsolescent SYNOPSIS is removed.

## 35095 NAME

35096 strings — find printable strings in files

## 35097 SYNOPSIS

35098 UP strings [-a][-t *format*][-n *number*][*file...*]

35099

## 35100 DESCRIPTION

35101 **Notes to Reviewers**35102 *This section with side shading will not appear in the final copy. - Ed.*

35103 D1, XCU, ERN 342 requests that the domain of this utility exclude internationalized strings.

35104 The *strings* utility shall look for printable strings in regular files and shall write those strings to  
 35105 standard output. A printable string is any sequence of four (by default) or more printable  
 35106 characters terminated by a <newline> or NUL character. Additional implementation-dependent  
 35107 strings may be written; see *localedef*.

## 35108 OPTIONS

35109 The *strings* utility shall conform to the System Interface Definitions volume of  
 35110 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

35111 The following options shall be supported:

35112 **-a** Scan files in their entirety. If **-a** is not specified, it is implementation-dependent  
 35113 what portion of each file is scanned for strings.

35114 **-n *number*** Specify the minimum string length, where the *number* argument is a positive  
 35115 decimal integer. The default shall be 4.

35116 **-t *format*** Write each string preceded by its byte offset from the start of the file. The format  
 35117 shall be dependent on the single character used as the *format* option-argument:

35118     d The offset shall be written in decimal.

35119     o The offset shall be written in octal.

35120     x The offset shall be written in hexadecimal.

## 35121 OPERANDS

35122 The following operand shall be supported:

35123 ***file*** A path name of a regular file to be used as input. If no *file* operand is specified, the  
 35124 *strings* utility shall read from the standard input.

## 35125 STDIN

35126 See the INPUT FILES section.

## 35127 INPUT FILES

35128 The input files named by the utility arguments or the standard input shall be regular files of any  
 35129 format.

## 35130 ENVIRONMENT VARIABLES

35131 The following environment variables shall affect the execution of *strings*:

35132 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 35133 If *LANG* is unset or null, the corresponding value from the implementation-  
 35134 dependent default locale shall be used. If any of the internationalization variables  
 35135 contains an invalid setting, the utility shall behave as if none of the variables had  
 35136 been defined.

35137 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 35138 internationalization variables.

35139 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 35140 characters (for example, single-byte as opposed to multi-byte characters in  
 35141 arguments and input files) and to identify printable strings.

35142 **LC\_MESSAGES**  
 35143 Determine the locale that should be used to affect the format and contents of  
 35144 diagnostic messages written to standard error.

35145 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

35146 **ASYNCHRONOUS EVENTS**  
 35147 Default.

35148 **STDOUT**  
 35149 Strings found shall be written to the standard output, one per line.  
 35150 When the **-t** option is not specified, the format of the output shall be:  
 35151 "%s", <string>  
 35152 With the **-t o** option, the format of the output shall be:  
 35153 "%o %s", <byte offset>, <string>  
 35154 With the **-t x** option, the format of the output shall be:  
 35155 "%x %s", <byte offset>, <string>  
 35156 With the **-t d** option, the format of the output shall be:  
 35157 "%d %s", <byte offset>, <string>

35158 **STDERR**  
 35159 Used only for diagnostic messages.

35160 **OUTPUT FILES**  
 35161 None.

35162 **EXTENDED DESCRIPTION**  
 35163 None.

35164 **EXIT STATUS**  
 35165 The following exit values shall be returned:  
 35166 0 Successful completion.  
 35167 >0 An error occurred.

35168 **CONSEQUENCES OF ERRORS**  
 35169 Default.

35170 **APPLICATION USAGE**

35171 By default the data area (as opposed to the text, “bss” or header areas) of a binary executable file  
35172 is scanned. Implementations document which areas are scanned.

35173 Some historical implementations do not require NUL or <newline> character terminators for  
35174 strings to permit those languages that do not use NUL as a string terminator to have their strings  
35175 written.

35176 Application writers should note that this utility need not be provided on systems that do not  
35177 support the User Portability Utilities option.

35178 **EXAMPLES**

35179 None.

35180 **RATIONALE**

35181 Apart from rationalizing the option syntax and slight difficulties with object and executable  
35182 binary files, *strings* is specified to match historical practice closely. The **-a** and **-n** options were  
35183 introduced to replace the non-conforming **-** and **-number** options.

35184 The **-o** option historically means different things on different implementations. Some use it to  
35185 mean “*offset* in decimal”, while others use it as “*offset* in octal”. Instead of trying to decide which  
35186 way would be least objectionable, the **-t** option was added. It was originally named **-O** to mean  
35187 “*offset*”, but was changed to **-t** to be consistent with *od*.

35188 The ISO C standard function *isprint()* is restricted to a domain of **unsigned char**. This volume of  
35189 IEEE Std. 1003.1-200x requires implementations to write strings as defined by the current locale.

35190 **FUTURE DIRECTIONS**

35191 None.

35192 **SEE ALSO**

35194 **CHANGE HISTORY**

35195 First released in Issue 4.

35196 **Issue 6**

35197 This utility is now marked as part of the User Portability Utilities option.

35198 The obsolescent SYNOPSIS is removed. |

35199 The normative text is reworded to avoid use of the term “must” for application requirements. |

35200 **NAME**35201 strip — remove unnecessary information from executable files (**DEVELOPMENT**)35202 **SYNOPSIS**

35203 SD strip file...

35204

35205 **DESCRIPTION**

35206 The *strip* utility shall remove from executable files named by the *file* operands any information  
 35207 the implementor deems unnecessary for execution of those files. The nature of that information  
 35208 is unspecified. The effect of *strip* shall be the same as the use of the *-s* option to *cc*, *c89*, or *fort77*.

35209 **OPTIONS**

35210 None.

35211 **OPERANDS**

35212 The following operand shall be supported:

35213 *file* A path name referring to an executable file.35214 **STDIN**

35215 Not used.

35216 **INPUT FILES**

35217 The input files shall be in the form of executable files successfully produced by any compiler  
 35218 defined by this volume of IEEE Std. 1003.1-200x.

35219 **ENVIRONMENT VARIABLES**35220 The following environment variables shall affect the execution of *strip*:

35221 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 35222 If *LANG* is unset or null, the corresponding value from the implementation-  
 35223 dependent default locale shall be used. If any of the internationalization variables  
 35224 contains an invalid setting, the utility shall behave as if none of the variables had  
 35225 been defined.

35226 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 35227 internationalization variables.

35228 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 35229 characters (for example, single-byte as opposed to multi-byte characters in  
 35230 arguments).

35231 *LC\_MESSAGES*

35232 Determine the locale that should be used to affect the format and contents of  
 35233 diagnostic messages written to standard error.

35234 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.35235 **ASYNCHRONOUS EVENTS**

35236 Default.

35237 **STDOUT**

35238 Not used.

35239 **STDERR**

35240 Used only for diagnostic messages.

35241 **OUTPUT FILES**

35242           The *strip* utility shall produce executable files of unspecified format.

35243 **EXTENDED DESCRIPTION**

35244           None.

35245 **EXIT STATUS**

35246           The following exit values shall be returned:

35247           0   Successful completion.

35248           >0   An error occurred.

35249 **CONSEQUENCES OF ERRORS**

35250           Default.

35251 **APPLICATION USAGE**

35252           None.

35253 **EXAMPLES**

35254           None.

35255 **RATIONALE**

35256           Historically, this utility has been used to remove the symbol table from an executable file. It was  
35257           included since it is known that the amount of symbolic information can amount to several  
35258           megabytes; the ability to remove it in a portable manner was deemed important, especially for  
35259           smaller systems.

35260           The behavior of *strip* is said to be the same as the *-s* option to a compiler. While the end result is  
35261           essentially the same, it is not required to be identical. The same effect can be achieved with  
35262           either *-s* during a compile or a *strip* on the final object file.

35263 **FUTURE DIRECTIONS**

35264           None.

35265 **SEE ALSO**

35266           *ar*, *c89*, *fort77*

35267 **CHANGE HISTORY**

35268           First released in Issue 2.

35269 **Issue 4**

35270           Aligned with the ISO/IEC 9945-2: 1993 standard.

35271 **Issue 6**

35272           This utility is now marked as part of the Software Development Utilities option.

35273 **NAME**

35274           stty — set the options for a terminal

35275 **SYNOPSIS**

35276           stty [ -a | -g ]

35277           stty *operands*35278 **DESCRIPTION**

35279       The *stty* utility shall set or report on terminal I/O characteristics for the device that is its  
 35280       standard input. Without options or operands specified, it shall report the settings of certain  
 35281       characteristics, usually those that differ from implementation-dependent defaults. Otherwise, it  
 35282       shall modify the terminal state according to the specified operands. Detailed information about  
 35283       the modes listed in the first five groups below are described in the System Interface Definitions  
 35284       volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal Interface. Operands in the  
 35285       Combination Modes group (see **Combination Modes** on page 927) are implemented using  
 35286       operands in the previous groups. Some combinations of operands are mutually-exclusive on  
 35287       some terminal types; the results of using such combinations are unspecified.

35288       Typical implementations of this utility require a communications line configured to use the  
 35289       **termios** interface defined in the System Interfaces volume of IEEE Std. 1003.1-200x. On systems  
 35290       where none of these lines are available, and on lines not currently configured to support the  
 35291       **termios** interface, some of the operands need not affect terminal characteristics.

35292 **OPTIONS**

35293       The *stty* utility shall conform to the System Interface Definitions volume of  
 35294       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

35295       The following options shall be supported:

35296       **-a**           Write to standard output all the current settings for the terminal.

35297       **-g**           Write to standard output all the current settings in an unspecified form that can be  
 35298       used as arguments to another invocation of the *stty* utility on the same system. The  
 35299       form used shall not contain any characters that would require quoting to avoid  
 35300       word expansion by the shell; see Section 2.6 on page 49.

35301 **OPERANDS**

35302       The following operands shall be supported to set the terminal characteristics.

35303       **Control Modes**

35304       **parenb** (**-parenb**) Enable (disable) parity generation and detection. This has the effect of setting  
 35305       (not setting) PARENB in the **termios** *c\_cflag* field, as defined in the System  
 35306       Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General  
 35307       Terminal Interface.

35308       **parodd** (**-parodd**) Select odd (even) parity. This shall have the effect of setting (not setting)  
 35309       PARODD in the **termios** *c\_cflag* field, as defined in the System Interface  
 35310       Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal  
 35311       Interface.

35312       **cs5 cs6 cs7 cs8** Select character size, if possible. This shall have the effect of setting CS5, CS6,  
 35313       CS7, and CS8, respectively, in the **termios** *c\_cflag* field, as defined in the  
 35314       System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11,  
 35315       General Terminal Interface.

35316       *number*       Set terminal baud rate to the number given, if possible. If the baud rate is set  
 35317       to zero, the modem control lines shall not be longer asserted. This shall have

|       |                         |                                                                                                        |
|-------|-------------------------|--------------------------------------------------------------------------------------------------------|
| 35318 |                         | the effect of setting the input and output <b>termios</b> baud rate values as defined                  |
| 35319 |                         | in the System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter                           |
| 35320 |                         | 11, General Terminal Interface.                                                                        |
| 35321 | <b>ispeed number</b>    | Set terminal input baud rate to the number given, if possible. If the input baud                       |
| 35322 |                         | rate is set to zero, the input baud rate shall be specified by the value of the                        |
| 35323 |                         | output baud rate. This shall have the effect of setting the input <b>termios</b> baud                  |
| 35324 |                         | rate values as defined in the System Interface Definitions volume of                                   |
| 35325 |                         | IEEE Std. 1003.1-200x, Chapter 11, General Terminal Interface.                                         |
| 35326 | <b>ospeed number</b>    | Set terminal output baud rate to the number given, if possible. If the output                          |
| 35327 |                         | baud rate is set to zero, the modem control lines shall no longer be asserted.                         |
| 35328 |                         | This shall have the effect of setting the output <b>termios</b> baud rate values as                    |
| 35329 |                         | defined in the System Interface Definitions volume of IEEE Std. 1003.1-200x,                           |
| 35330 |                         | Chapter 11, General Terminal Interface.                                                                |
| 35331 | <b>hupcl (-hupcl)</b>   | Stop asserting modem control lines (do not stop asserting modem control                                |
| 35332 |                         | lines) on last close. This shall have the effect of setting (not setting) HUPCL in                     |
| 35333 |                         | the <b>termios</b> <i>c_cflag</i> field, as defined in the System Interface Definitions volume         |
| 35334 |                         | of IEEE Std. 1003.1-200x, Chapter 11, General Terminal Interface.                                      |
| 35335 | <b>hup (-hup)</b>       | Same as <b>hupcl(-hupcl)</b> .                                                                         |
| 35336 | <b>cstopb (-cstopb)</b> | Use two (one) stop bits per character. This shall have the effect of setting (not                      |
| 35337 |                         | setting) CSTOPB in the <b>termios</b> <i>c_cflag</i> field, as defined in the System Interface         |
| 35338 |                         | Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal                              |
| 35339 |                         | Interface.                                                                                             |
| 35340 | <b>cread (-cread)</b>   | Enable (disable) the receiver. This shall have the effect of setting (not setting)                     |
| 35341 |                         | CREAD in the <b>termios</b> <i>c_cflag</i> field, as defined in the System Interface                   |
| 35342 |                         | Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal                              |
| 35343 |                         | Interface.                                                                                             |
| 35344 | <b>clocal (-clocal)</b> | Assume a line without (with) modem control. This shall have the effect of                              |
| 35345 |                         | setting (not setting) CLOCAL in the <b>termios</b> <i>c_cflag</i> field, as defined in the             |
| 35346 |                         | System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11,                              |
| 35347 |                         | General Terminal Interface.                                                                            |
| 35348 |                         | It is unspecified whether <i>stty</i> shall report an error if an attempt to set a Control Mode fails. |
| 35349 | <b>Input Modes</b>      |                                                                                                        |
| 35350 | <b>ignbrk (-ignbrk)</b> | Ignore (do not ignore) break on input. This shall have the effect of setting (not                      |
| 35351 |                         | setting) IGNBRK in the <b>termios</b> <i>c_iflag</i> field, as defined in the System Interface         |
| 35352 |                         | Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal                              |
| 35353 |                         | Interface.                                                                                             |
| 35354 | <b>brkint (-brkint)</b> | Signal (do not signal) INTR on break. This shall have the effect of setting (not                       |
| 35355 |                         | setting) BRKINT in the <b>termios</b> <i>c_iflag</i> field, as defined in the System Interface         |
| 35356 |                         | Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal                              |
| 35357 |                         | Interface.                                                                                             |
| 35358 | <b>ignpar (-ignpar)</b> | Ignore (do not ignore) bytes with parity errors. This shall have the effect of                         |
| 35359 |                         | setting (not setting) IGNPAR in the <b>termios</b> <i>c_iflag</i> field, as defined in the             |
| 35360 |                         | System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11,                              |
| 35361 |                         | General Terminal Interface.                                                                            |

|           |                                  |                                                                                                  |
|-----------|----------------------------------|--------------------------------------------------------------------------------------------------|
| 35362     | <b>parmrk</b> ( <b>-parmrk</b> ) |                                                                                                  |
| 35363     |                                  | Mark (do not mark) parity errors. This shall have the effect of setting (not                     |
| 35364     |                                  | setting) PARMRK in the <b>termios</b> <i>c_iflag</i> field, as defined in the System             |
| 35365     |                                  | Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General                       |
| 35366     |                                  | Terminal Interface.                                                                              |
| 35367     | <b>inpck</b> ( <b>-inpck</b> )   | Enable (disable) input parity checking. This shall have the effect of setting (not               |
| 35368     |                                  | setting) INPCK in the <b>termios</b> <i>c_iflag</i> field, as defined in the System Interface    |
| 35369     |                                  | Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal                        |
| 35370     |                                  | Interface.                                                                                       |
| 35371     | <b>istrip</b> ( <b>-istrip</b> ) | Strip (do not strip) input characters to seven bits. This shall have the effect of               |
| 35372     |                                  | setting (not setting) ISTRIP in the <b>termios</b> <i>c_iflag</i> field, as defined in the       |
| 35373     |                                  | System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11,                        |
| 35374     |                                  | General Terminal Interface.                                                                      |
| 35375     | <b>inlcr</b> ( <b>-inlcr</b> )   | Map (do not map) NL to CR on input. This shall have the effect of setting (not                   |
| 35376     |                                  | setting) INLCR in the <b>termios</b> <i>c_iflag</i> field, as defined in the System Interface    |
| 35377     |                                  | Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal                        |
| 35378     |                                  | Interface.                                                                                       |
| 35379     | <b>igncr</b> ( <b>-igncr</b> )   | Ignore (do not ignore) CR on input. This shall have the effect of setting (not                   |
| 35380     |                                  | setting) IGNCR in the <b>termios</b> <i>c_iflag</i> field, as defined in the System Interface    |
| 35381     |                                  | Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal                        |
| 35382     |                                  | Interface.                                                                                       |
| 35383     | <b>icrnl</b> ( <b>-icrnl</b> )   | Map (do not map) CR to NL on input. This shall have the effect of setting (not                   |
| 35384     |                                  | setting) ICRNL in the <b>termios</b> <i>c_iflag</i> field, as defined in the System Interface    |
| 35385     |                                  | Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal                        |
| 35386     |                                  | Interface.                                                                                       |
| 35387     | <b>ixon</b> ( <b>-ixon</b> )     | Enable (disable) START/STOP output control. Output from the system is                            |
| 35388     |                                  | stopped when the system receives STOP and started when the system receives                       |
| 35389     |                                  | START. This shall have the effect of setting (not setting) IXON in the <b>termios</b>            |
| 35390     |                                  | <i>c_iflag</i> field, as defined in the System Interface Definitions volume of                   |
| 35391     |                                  | IEEE Std. 1003.1-200x, Chapter 11, General Terminal Interface.                                   |
| 35392 XSI | <b>ixany</b> ( <b>-ixany</b> )   | Allow any character to restart output. This shall have the effect of setting (not                |
| 35393     |                                  | setting) IXANY in the <b>termios</b> <i>c_iflag</i> field, as defined in the System Interface    |
| 35394     |                                  | Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal                        |
| 35395     |                                  | Interface.                                                                                       |
| 35396     | <b>ixoff</b> ( <b>-ixoff</b> )   | Request that the system send (not send) STOP characters when the input                           |
| 35397     |                                  | queue is nearly full and START characters to resume data transmission. This                      |
| 35398     |                                  | shall have the effect of setting (not setting) IXOFF in the <b>termios</b> <i>c_iflag</i> field, |
| 35399     |                                  | as defined in the System Interface Definitions volume of                                         |
| 35400     |                                  | IEEE Std. 1003.1-200x, Chapter 11, General Terminal Interface.                                   |

| 35489 | <b>tostop (-tostop)</b>   | Send SIGTTOU for background output. This shall have the effect of setting (not setting) TOSTOP in the <b>termios</b> <i>c_lflag</i> field, as defined in the System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal Interface.                                                                                                                                |
| 35490 |                           |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 35491 |                           |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 35492 |                           |                                                                                                                                                                                                                                                                                                                                                                                                   |

## Special Control Character Assignments

### <control>-character string

Set <control>-character to *string*. If <control>-character is one of the character sequences in the first column of the following table, the corresponding System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal Interface control character from the second column shall be recognized. This has the effect of setting the corresponding element of the **termios** *c\_cc* array (see the System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, Headers, <**termios.h**>).

**Table 4-19** Control Character Names in *stty*

| Control Character | c_cc Subscript | Description     |
|-------------------|----------------|-----------------|
| <b>eof</b>        | VEOF           | EOF character   |
| <b>eol</b>        | VEOL           | EOL character   |
| <b>erase</b>      | VERASE         | ERASE character |
| <b>intr</b>       | VINTR          | INTR character  |
| <b>kill</b>       | VKILL          | KILL character  |
| <b>quit</b>       | VQUIT          | QUIT character  |
| <b>susp</b>       | VSUSP          | SUSP character  |
| <b>start</b>      | VSTART         | START character |
| <b>stop</b>       | VSTOP          | STOP character  |

If *string* is a single character, the control character shall be set to that character. If *string* is the two-character sequence "^\_" or the string *undef*, the control character shall be set to `_POSIX_VDISABLE`, if it is in effect for the device; if `_POSIX_VDISABLE` is not in effect for the device, it shall be treated as an error. In the POSIX locale, if *string* is a two-character sequence beginning with circumflex ('^'), and the second character is one of those listed in the "^c" column of the following table, the control character shall be set to the corresponding character value in the Value column of the table.

**Table 4-20** Circumflex Control Characters in *stty*

| ^c   | Value | ^c   | Value | ^c   | Value |
|------|-------|------|-------|------|-------|
| a, A | <SOH> | l, L | <FF>  | w, W | <ETB> |
| b, B | <STX> | m, M | <CR>  | x, X | <CAN> |
| c, C | <ETX> | n, N | <SO>  | y, Y | <EM>  |
| d, D | <EOT> | o, O | <SI>  | z, Z | <SUB> |
| e, E | <ENQ> | p, P | <DLE> | [    | <ESC> |
| f, F | <ACK> | q, Q | <DC1> | \    | <FS>  |
| g, G | <BEL> | r, R | <DC2> | ]    | <GS>  |
| h, H | <BS>  | s, S | <DC3> | ^    | <RS>  |
| i, I | <HT>  | t, T | <DC4> | _    | <US>  |
| j, J | <LF>  | u, U | <NAK> | ?    | <DEL> |
| k, K | <VT>  | v, V | <SYN> |      |       |

### **min** *number*

### **time** *number*

Set the value of **min** or **time** to *number*. MIN and TIME are used in non-canonical mode input processing (**icanon**).

35536 **Combination Modes**35537 *saved settings*35538 Set the current terminal characteristics to the saved settings produced by the **-g** option.35539 **evenp** or **parity**35540 Enable **parenb** and **cs7**; disable **parodd**.35541 **oddp**35542 Enable **parenb**, **cs7**, and **parodd**.35543 **-parity**, **-evenp**, or **-oddp**35544 Disable **parenb**, and set **cs8**.35545 XSI **raw** (**-raw** or **cooked**)

35546 Enable (disable) raw input and output. Raw mode shall be equivalent to setting:

```
35547 stty cs8 erase ^- kill ^- intr ^- \
35548 quit ^- eof ^- eol ^- -post -inpck
```

35549 **nl** (**-nl**)35550 Enable (disable) **icrnl**. In addition, **-nl** unsets **inlcr** and **igncr**.35551 XSI **tabs** (**-tabs** or **tab3**)

35552 Preserve tabs (expand to spaces) when printing.

35553 **ek** Reset ERASE and KILL characters back to system defaults.35554 **sane** Reset all modes to some reasonable, unspecified, values.35555 **STDIN**

35556 Although no input is read from standard input, standard input is used to get the current  
 35557 terminal I/O characteristics and to set new terminal I/O characteristics.

35558 **INPUT FILES**

35559 None.

35560 **ENVIRONMENT VARIABLES**35561 The following environment variables shall affect the execution of *stty*:

35562 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 35563 If **LANG** is unset or null, the corresponding value from the implementation-  
 35564 dependent default locale shall be used. If any of the internationalization variables  
 35565 contains an invalid setting, the utility shall behave as if none of the variables had  
 35566 been defined.

35567 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 35568 internationalization variables.

35569 **LC\_CTYPE** This variable determines the locale for the interpretation of sequences of bytes of  
 35570 text data as characters (for example, single-byte as opposed to multi-byte  
 35571 characters in arguments) and which characters are in the class **print**.

35572 **LC\_MESSAGES**

35573 Determine the locale that should be used to affect the format and contents of  
 35574 diagnostic messages written to standard error.

35575 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

35576 **ASYNCHRONOUS EVENTS**

35577 Default.

35578 **STDOUT**

35579 If operands are specified, no output shall be produced.

35580 If the **-g** option is specified, *stty* shall write to standard output the current settings in a form that  
 35581 can be used as arguments to another instance of *stty* on the same system.

35582 If the **-a** option is specified, all of the information as described in the OPERANDS section shall  
 35583 be written to standard output. Unless otherwise specified, this information shall be written as  
 35584 <space>-separated tokens in an unspecified format, on one or more lines, with an unspecified  
 35585 number of tokens per line. Additional information may be written.

35586 If no options or operands are specified, an unspecified subset of the information written for the  
 35587 **-a** option shall be written.

35588 If speed information is written as part of the default output, or if the **-a** option is specified and if  
 35589 the terminal input speed and output speed are the same, the speed information shall be written  
 35590 as follows:

35591 "speed %d baud;", &lt;speed&gt;

35592 Otherwise, speeds shall be written as:

35593 "ispeed %d baud; ospeed %d baud;", &lt;ispeed&gt;, &lt;ospeed&gt;

35594 In locales other than the POSIX locale, the word **baud** may be changed to something more  
 35595 appropriate in those locales.

35596 If control characters are written as part of the default output, or if the **-a** option is specified,  
 35597 control characters shall be written as:

35598 "%s = %s;", &lt;control-character name&gt;, &lt;value&gt;

35599 where <value> is either the character, or some visual representation of the character if it is non-  
 35600 printable, or the string *undef* if the character is disabled.

35601 **STDERR**

35602 Used only for diagnostic messages.

35603 **OUTPUT FILES**

35604 None.

35605 **EXTENDED DESCRIPTION**

35606 None.

35607 **EXIT STATUS**

35608 The following exit values shall be returned:

35609 0 The terminal options were read or set successfully.

35610 &gt;0 An error occurred.

35611 **CONSEQUENCES OF ERRORS**

35612 Default.

35613 **APPLICATION USAGE**

35614 The **-g** flag is designed to facilitate the saving and restoring of terminal state from the shell level.  
 35615 For example, a program may:

```
35616 saveterm="$(stty -g)" # save terminal state
35617 stty (new settings) # set new state
35618 ... # ...
35619 stty $saveterm # restore terminal state
```

35620 Since the format is unspecified, the saved value is not portable across systems.

35621 Since the **-a** format is so loosely specified, scripts that save and restore terminal settings should  
 35622 use the **-g** option.

35623 **EXAMPLES**

35624 None.

35625 **RATIONALE**

35626 The original *stty* description was taken directly from System V and reflected the System V  
 35627 terminal driver **termio**. It has been modified to correspond to the terminal driver **termios**.

35628 Since the System Interface Definitions volume of IEEE Std. 1003.1-200x does not specify any  
 35629 output modes, they are not specified in this volume of IEEE Std. 1003.1-200x either.  
 35630 Implementations are expected to provide *stty* operands corresponding to all of the output modes  
 35631 they support.

35632 In many ways outside the scope of this volume of IEEE Std. 1003.1-200x, *stty* is primarily used to  
 35633 tailor the user interface of the terminal, such as selecting the preferred ERASE and KILL  
 35634 characters. As an application programming utility, *stty* can be used within shell scripts to alter  
 35635 the terminal settings for the duration of the script.

35636 The **termios** section states that individual disabling of control characters is possible through the  
 35637 option **\_POSIX\_VDISABLE**. If enabled, two conventions currently exist for specifying this:  
 35638 System V uses "**^-**", and BSD uses *undef*. Both are accepted by *stty* in this volume of  
 35639 IEEE Std. 1003.1-200x. The other BSD convention of using the letter '**u**' was rejected because it  
 35640 conflicts with the actual letter '**u**', which is an acceptable value for a control character.

35641 Early proposals did not specify the mapping of "**^c**" to control characters because the control  
 35642 characters were not specified in the POSIX locale character set description file requirements. The  
 35643 control character set is now specified in the System Interface Definitions volume of  
 35644 IEEE Std. 1003.1-200x, Chapter 3, Definitions so the historical mapping is specified. Note that  
 35645 although the mapping corresponds to control-character key assignments on many terminals that  
 35646 use the ISO/IEC 646:1991 standard (or ASCII) character encodings, the mapping specified here  
 35647 is to the control characters, not their keyboard encodings.

35648 Since **termios** supports separate speeds for input and output, two new options were added to  
 35649 specify each distinctly.

35650 Some historical implementations use standard input to get and set terminal characteristics;  
 35651 others use standard output. Since input from a login TTY is usually restricted to the owner while  
 35652 output to a TTY is frequently open to anyone, using standard input provides fewer chances of  
 35653 accidentally (or maliciously) altering the terminal settings of other users. Using standard input  
 35654 also allows *stty -a* and *stty -g* output to be redirected for later use. Therefore, usage of standard  
 35655 input is required by this volume of IEEE Std. 1003.1-200x.

35656 The **tostop** option is the only option that requires job control to be effective, and thus could have  
 35657 gone into the UPE as a modification to *stty*, but since all other terminal control features are in the  
 35658 base standard, **tostop** was included as well.

35659 **FUTURE DIRECTIONS**

35660 None.

35661 **SEE ALSO**35662 The System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal  
35663 Interface35664 **CHANGE HISTORY**

35665 First released in Issue 2.

35666 **Issue 4**

35667 Aligned with the ISO/IEC 9945-2: 1993 standard.

35668 **Issue 5**35669 The description of **tabs** is clarified.

35670 FUTURE DIRECTIONS section added.

35671 **Issue 6**35672 The legacy items **iuclt(-iuclt)**, **xcase**, **olcuc(-olcuc)**, **lcase(-lcase)**, and **LCASE(-LCASE)**, are  
35673 removed.

## 35674 NAME

35675 tabs — set terminal tabs

## 35676 SYNOPSIS

35677 UP XSI tabs [ -n | -a | -a2 | -c | -c2 | -c3 | -f | -p | -s | -u ][ +m[n] ] [-T type]

35678 tabs [-T type][ +[n] ] n1[,n2,...]

35679

## 35680 DESCRIPTION

35681 The *tabs* utility shall display a series of characters that first clears the hardware terminal tab  
 35682 XSI settings and then initializes the tab stops at the specified positions and optionally adjusts the  
 35683 margin.

35684 The phrase “tab-stop position *N*” shall be taken to mean that, from the start of a line of output,  
 35685 tabbing to position *N* shall cause the next character output to be in the (*N*+1)th column position  
 35686 on that line. The maximum number of tab stops allowed is terminal-dependent.

35687 It need not be possible to implement *tabs* on certain terminals. If the terminal type obtained from  
 35688 the *TERM* environment variable or *-T* option represents such a terminal, an appropriate  
 35689 diagnostic message shall be written to standard error and *tabs* shall exit with a status greater  
 35690 than zero.

## 35691 OPTIONS

35692 The *tabs* utility shall conform to the System Interface Definitions volume of  
 35693 XSI IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines, except for various extensions: the  
 35694 options *-a2*, *-c2*, and *-c3* are multi-character and *+m [n]* uses a leading plus sign and an  
 35695 optional option-argument.

35696 The following options shall be supported:

35697 *-n* Specify repetitive tab stops separated by a uniform number of column positions, *n*,  
 35698 where *n* is a single-digit decimal number. The default usage of *tabs* with no  
 35699 arguments shall be equivalent to *tabs-8*. When *-0* is used, the tab stops shall be  
 35700 cleared and no new ones set.

35701 XSI *-a* 1,10,16,36,72  
 35702 Assembler, applicable to some mainframes.

35703 XSI *-a2* 1,10,16,40,72  
 35704 Assembler, applicable to some mainframes.

35705 XSI *-c* 1,8,12,16,20,55  
 35706 COBOL, normal format.

35707 XSI *-c2* 1,6,10,14,49  
 35708 COBOL, compact format (columns 1-6 omitted).

35709 XSI *-c3* 1,6,10,14,18,22,26,30,34,38,42,46,50,54,58,62,67  
 35710 COBOL compact format (columns 1-6 omitted), with more tabs than *-c2*.

35711 XSI *-f* 1,7,11,15,19,23  
 35712 FORTRAN

35713 XSI *-p* 1,5,9,13,17,21,25,29,33,37,41,45,49,53,57,61  
 35714 PL/1

35715 XSI *-s* 1,10,55  
 35716 SNOBOL

|              |                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 35729        | <b>n1[,n2,...]</b>                                                              | A single command line argument that consists of tab-stop values separated using either commas or <blank> characters. The application shall ensure that the tab-stop values are positive decimal integers in strictly ascending order. If any number (except the first one) is preceded by a plus sign, it is taken as an increment to be added to the previous value. For example, the tab lists 1,10,20,30 and 1,10,+10,+10 are considered to be identical. |

| 35758        | Default.                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**35759 STDOUT**

35760 If standard output is a terminal, the appropriate sequence to clear and set the tab stops may be  
 35761 written to standard output in an unspecified format. If standard output is not a terminal,  
 35762 undefined results occur.

**35763 STDERR**

35764 Used only for diagnostic messages.

**35765 OUTPUT FILES**

35766 None.

**35767 EXTENDED DESCRIPTION**

35768 None.

**35769 EXIT STATUS**

35770 The following exit values shall be returned:

35771 0 Successful completion.

35772 >0 An error occurred.

**35773 CONSEQUENCES OF ERRORS**

35774 Default.

**35775 APPLICATION USAGE**

35776 This utility makes use of the terminal's hardware tabs and the *stty tabs* option.

35777 This utility is not recommended for application use.

35778 Some integrated display units might not have escape sequences to set tab stops, but may be set  
 35779 by internal system calls. On these terminals, *tabs* works if standard output is directed to the  
 35780 terminal; if output is directed to another file, however, *tabs* fails.

35781 Application writers should note that this utility need not be provided on systems that do not  
 35782 support the User Portability Utilities option.

**35783 EXAMPLES**

35784 None.

**35785 RATIONALE**

35786 Consideration was given to having the *tput* utility handle all of the functions described in *tabs*.  
 35787 However, the separate *tabs* utility was retained because it seems more intuitive to use a  
 35788 command named *tabs* than *tput* with a new option. The POSIX Shell and Utilities *tput* does not  
 35789 support setting or clearing tabs, and no known historical version of *tabs* supports the capability  
 35790 of setting arbitrary tab stops.

35791 The System V *tabs* interface is very complex; the version in this volume of IEEE Std. 1003.1-200x  
 35792 has a reduced feature list. There was considerable sentiment for specifying only a means of  
 35793 resetting the tabs back to a known state—presumably the “standard” of tabs every eight  
 35794 positions. The following features were omitted:

- 35795 • Setting tab stops tailored for certain programming languages; the standard developers were  
 35796 concerned that it would be difficult to decide which languages to include and where the tabs  
 35797 should be.
- 35798 • Setting tab stops via the first line in a file, using *—file*. Since even the SVID has no complete  
 35799 explanation of this feature, it is doubtful that it is in widespread use.
- 35800 • Setting the left margin using *+mn*. As this does not work with all terminal types, it was  
 35801 omitted.

35802 In an early proposal, a **-t** *tablist* option was added for consistency with *expand*; this was later  
 35803 removed when inconsistencies with the historical list of tabs were identified.

35804 Consideration was given to adding a **-p** option that would output the current tab settings so  
 35805 that they could be saved and then later restored. This was not accepted because querying the tab  
 35806 stops of the terminal is not a capability in historical *terminfo* or *termcap* facilities and might not be  
 35807 supported on a wide range of terminals.

35808 **FUTURE DIRECTIONS**

35809 None.

35811 *expand, stty, unexpand*

35812 **CHANGE HISTORY**

35813 First released in Issue 2.

35814 **Issue 4**

35815 Aligned with the ISO/IEC 9945-2: 1993 standard.

35816 **Issue 6**

35817 This utility is now marked as part of the User Portability Utilities option. |

35818 The normative text is reworded to avoid use of the term “must” for application requirements. |

35819 **NAME**35820 **tail** — copy the last part of a file35821 **SYNOPSIS**35822 **tail** [-f][ -c *number* | -n *number*][*file*]35823 **DESCRIPTION**35824 The *tail* utility shall copy its input file to the standard output beginning at a designated place.

35825 Copying shall begin at the point in the file indicated by the **-c** *number* or **-n** *number* options. The  
 35826 option-argument *number* shall be counted in units of lines or bytes, according to the options **-n**  
 35827 and **-c**. Both line and byte counts start from 1.

35828 Tails relative to the end of the file may be saved in an internal buffer, and thus may be limited in  
 35829 length. Such a buffer, if any, is no smaller than {LINE\_MAX}\*10 bytes.

35830 **OPTIONS**

35831 The *tail* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 35832 Section 12.2, Utility Syntax Guidelines.

35833 The following options shall be supported:

35834 **-c** *number* The application shall ensure that the *number* option-argument is a decimal integer  
 35835 whose sign affects the location in the file, measured in bytes, to begin the copying:

| 35836 | Sign        | Copying Starts                         |
|-------|-------------|----------------------------------------|
| 35837 | +           | Relative to the beginning of the file. |
| 35838 | -           | Relative to the end of the file.       |
| 35839 | <i>none</i> | Relative to the end of the file.       |

35840 The origin for counting shall be 1; that is, **-c** +1 represents the first byte of the file,  
 35841 **-c** -1 the last.

35842 **-f** If the input file is a regular file or if the *file* operand specifies a FIFO, do not  
 35843 terminate after the last line of the input file has been copied, but read and copy  
 35844 further bytes from the input file when they become available. If no *file* operand is  
 35845 specified and standard input is a pipe, the **-f** option shall be ignored. If the input  
 35846 file is not a FIFO, pipe, or regular file, it is unspecified whether or not the **-f** option  
 35847 shall be ignored.

35848 **-n** *number* This option is equivalent to **-c** *number*, except the starting location in the file shall  
 35849 be measured in lines instead of bytes. The origin for counting shall be 1; that is, **-n**  
 35850 +1 represents the first line of the file, **-n** -1 the last.

35851 If neither **-c** nor **-n** is specified, **-n** 10 shall be assumed.35852 **OPERANDS**

35853 The following operand shall be supported:

35854 *file* A path name of an input file. If no *file* operands are specified, the standard input  
 35855 shall be used.

35856 **STDIN**

35857 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
 35858 section.

35859 **INPUT FILES**

35860 If the **-c** option is specified, the input file can contain arbitrary data; otherwise, the input file  
 35861 shall be a text file.

35862 **ENVIRONMENT VARIABLES**

35863 The following environment variables shall affect the execution of *tail*:

35864 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 35865 If **LANG** is unset or null, the corresponding value from the implementation-  
 35866 dependent default locale shall be used. If any of the internationalization variables  
 35867 contains an invalid setting, the utility shall behave as if none of the variables had  
 35868 been defined.

35869 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 35870 internationalization variables.

35871 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 35872 characters (for example, single-byte as opposed to multi-byte characters in  
 35873 arguments and input files).

35874 **LC\_MESSAGES**  
 35875 Determine the locale that should be used to affect the format and contents of  
 35876 diagnostic messages written to standard error.

35877 **XS** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

35878 **ASYNCHRONOUS EVENTS**

35879 Default.

35880 **STDOUT**

35881 The designated portion of the input file shall be written to standard output.

35882 **STDERR**

35883 Used only for diagnostic messages.

35884 **OUTPUT FILES**

35885 None.

35886 **EXTENDED DESCRIPTION**

35887 None.

35888 **EXIT STATUS**

35889 The following exit values shall be returned:

35890 **0** Successful completion.

35891 **>0** An error occurred.

35892 **CONSEQUENCES OF ERRORS**

35893 Default.

**35894 APPLICATION USAGE**

35895 The **-c** option should be used with caution when the input is a text file containing multi-byte  
35896 characters; it may produce output that does not start on a character boundary.

35897 Although the input file to *tail* can be any type, the results might not be what would be expected  
35898 on some character special device files or on file types not described by the System Interfaces  
35899 volume of IEEE Std. 1003.1-200x. Since this volume of IEEE Std. 1003.1-200x does not specify the  
35900 block size used when doing input, *tail* need not read all of the data from devices that only  
35901 perform block transfers.

**35902 EXAMPLES**

35903 The **-f** option can be used to monitor the growth of a file that is being written by some other  
35904 process. For example, the command:

35905 `tail -f fred`

35906 prints the last ten lines of the file **fred**, followed by any lines that are appended to **fred** between  
35907 the time *tail* is initiated and killed. As another example, the command:

35908 `tail -f -c 15 fred`

35909 prints the last 15 bytes of the file **fred**, followed by any bytes that are appended to **fred** between  
35910 the time *tail* is initiated and killed.

**35911 RATIONALE**

35912 This version of *tail* was created to allow conformance to the Utility Syntax Guidelines. The  
35913 historical **-b** option was omitted because of the general non-portability of block-sized units of  
35914 text. The **-c** option historically meant “characters”, but this volume of IEEE Std. 1003.1-200x  
35915 indicates that it means “bytes”. This was selected to allow reasonable implementations when  
35916 multi-byte characters are possible; it was not named **-b** to avoid confusion with the historical  
35917 **-b**.

35918 The origin of counting both lines and bytes is 1, matching all widespread historical  
35919 implementations.

35920 The restriction on the internal buffer is a compromise between the historical System V  
35921 implementation of 4 096 bytes and the BSD 32 768 bytes.

35922 The **-f** option has been implemented as a loop that sleeps for 1 second and copies any bytes that  
35923 are available. This is sufficient, but if more efficient methods of determining when new data are  
35924 available are developed, implementations are encouraged to use them.

35925 Historical documentation indicates that *tail* ignores the **-f** option if the input file is a pipe (pipe  
35926 and FIFO on systems that support FIFOs). On BSD-based systems, this has been true; on System  
35927 V-based systems, this was true when input was taken from standard input, but it did not ignore  
35928 the **-f** flag if a FIFO was named as the *file* operand. Since the **-f** option is not useful on pipes and  
35929 all historical implementations ignore **-f** if no *file* operand is specified and standard input is a  
35930 pipe, this volume of IEEE Std. 1003.1-200x requires this behavior. However, since the **-f** option is  
35931 useful on a FIFO, this volume of IEEE Std. 1003.1-200x also requires that if standard input is a  
35932 FIFO or a FIFO is named, the **-f** option shall not be ignored. Although historical behavior does  
35933 not ignore the **-f** option for other file types, this is unspecified so that implementations are  
35934 allowed to ignore the **-f** option if it is known that the file cannot be extended.

35935 This was changed to the current form based on comments noting that **-c** was almost never used  
35936 without specifying a number and that there was no need to specify **-l** if **-n number** was given.

|       |                                                                                              |  |

35948 **NAME**35949           *talk* — talk to another user35950 **SYNOPSIS**35951 UP       *talk address [terminal]*

35952

35953 **DESCRIPTION**35954       The *talk* utility is a two-way, screen-oriented communication program.35955       When first invoked, *talk* shall send a message similar to:

35956       Message from <*unspecified string*>  
 35957       *talk*: connection requested by *your\_address*  
 35958       *talk*: respond with: *talk your\_address*

35959       to the specified *address*. At this point, the recipient of the message can reply by typing:35960       *talk your\_address*

35961       Once communication is established, the two parties can type simultaneously, with their output  
 35962       displayed in separate regions of the screen. Characters shall be processed as follows:

- 35963       • Typing the alert character shall alert the recipient's terminal.
- 35964       • Typing <control>-L shall cause the sender's screen regions to be refreshed.
- 35965       • Typing the erase and kill characters shall affect the sender's terminal in the manner described  
 35966       by the **termios** interface in the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 35967       Chapter 11, General Terminal Interface.
- 35968       • Typing the interrupt or end-of-file characters shall terminate the local *talk* utility. Once the  
 35969       *talk* session has been terminated on one side, the other side of the *talk* session shall be notified  
 35970       that the *talk* session has been terminated and shall be able to do nothing except exit.
- 35971       • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those characters  
 35972       to be sent to the recipient's terminal.
- 35973       • When and only when the *stty iexten* local mode is enabled, the existence and processing of  
 35974       additional special control characters and multi-byte or single-byte functions shall be  
 35975       implementation-dependent.
- 35976       • Typing other non-printable characters shall cause implementation-dependent sequences of  
 35977       printable characters to be sent to the recipient's terminal.

35978       Permission to be a recipient of a *talk* message can be denied or granted by use of the *mesg* utility.  
 35979       However, a user's privilege may further constrain the domain of accessibility of other users'  
 35980       terminals. The *talk* utility shall fail when the user lacks the appropriate privileges to perform the  
 35981       requested action.

35982       Certain block-mode terminals do not have all the capabilities necessary to support the  
 35983       simultaneous exchange of messages required for *talk*. When this type of exchange cannot be  
 35984       supported on such terminals, the implementation may support an exchange with reduced levels  
 35985       of simultaneous interaction or it may report an error describing the terminal-related deficiency.

35986 **OPTIONS**

35987       None.

35988 **OPERANDS**

35989           The following operands shall be supported:

35990           *address*       The recipient of the *talk* session. One form of *address* is the <*user name*>, as returned  
35991                           by the *who* utility. Other address formats and how they are handled are  
35992                           unspecified.

35993           *terminal*      If the recipient is logged in more than once, the *terminal* argument can be used to  
35994                           indicate the appropriate terminal name. If *terminal* is not specified, the *talk* message  
35995                           shall be displayed on one or more accessible terminals in use by the recipient. The  
35996                           format of *terminal* shall be the same as that returned by the *who* utility.

35997 **STDIN**

35998           Characters read from standard input shall be copied to the recipient's terminal in an unspecified  
35999           manner. If standard input is not a terminal, *talk* shall write a diagnostic message and exit with a  
36000           non-zero status.

36001 **INPUT FILES**

36002           None.

36003 **ENVIRONMENT VARIABLES**

36004           The following environment variables shall affect the execution of *talk*:

36005           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
36006                           If *LANG* is unset or null, the corresponding value from the implementation-  
36007                           dependent default locale shall be used. If any of the internationalization variables  
36008                           contains an invalid setting, the utility shall behave as if none of the variables had  
36009                           been defined.

36010           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
36011                           internationalization variables.

36012           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
36013                           characters (for example, single-byte as opposed to multi-byte characters in  
36014                           arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
36015                           equivalent to the sender's, the results are undefined.

36016 *LC\_MESSAGES*

36017                           Determine the locale that should be used to affect the format and contents of  
36018                           diagnostic messages written to standard error and informative messages written to  
36019                           standard output.

36020 XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36021           *TERM*           Determine the name of the invoker's terminal type. If this variable is unset or null,  
36022                           an unspecified default terminal type shall be used.

36023 **ASYNCHRONOUS EVENTS**

36024           When the *talk* utility receives a SIGINT signal, the utility shall terminate and exit with a zero  
36025           status. It shall take the standard action for all other signals.

36026 **STDOUT**

36027           If standard output is a terminal, characters copied from the recipient's standard input may be  
36028           written to standard output. Standard output also may be used for diagnostic messages. If  
36029           standard output is not a terminal, *talk* shall exit with a non-zero status.

36030 **STDERR**

36031 None.

36032 **OUTPUT FILES**

36033 None.

36034 **EXTENDED DESCRIPTION**

36035 None.

36036 **EXIT STATUS**

36037 The following exit values shall be returned:

36038 0 Successful completion.

36039 >0 An error occurred or *talk* was invoked on a terminal incapable of supporting it.36040 **CONSEQUENCES OF ERRORS**

36041 Default.

36042 **APPLICATION USAGE**

36043 Because the handling of non-printable, non-`<space>` characters is tied to the *stty* description of  
 36044 **ixten**, implementation extensions within the terminal driver can be accessed. For example,  
 36045 some implementations provide line editing functions with certain control character sequences.

36046 Application writers should note that this utility need not be provided on systems that do not  
 36047 support the User Portability Utilities option.

36048 **EXAMPLES**

36049 None.

36050 **RATIONALE**

36051 The *write* utility was included in this volume of IEEE Std. 1003.1-200x since it can be  
 36052 implemented on all terminal types. The *talk* utility, which cannot be implemented on certain  
 36053 terminals, was considered to be a “better” communications interface. Both of these programs are  
 36054 in widespread use on historical implementations. Therefore, both utilities have been specified.

36055 All references to networking abilities (*talking* to a user on another system) were removed as  
 36056 being outside the scope of this volume of IEEE Std. 1003.1-200x.

36057 Historical BSD and System V versions of *talk* terminate both of the conversations when either  
 36058 user breaks out of the session. This can lead to adverse consequences if a user unwittingly  
 36059 continues to enter text that is interpreted by the shell when the other terminates the session.  
 36060 Therefore, the version of *talk* specified by this volume of IEEE Std. 1003.1-200x requires both  
 36061 users to terminate their end of the session explicitly.

36062 Only messages sent to the terminal of the invoking user can be internationalized in any way:

- 36063 • The original “Message from *<unspecified string>* ...” message sent to the terminal of the  
 36064 recipient cannot be internationalized because the environment of the recipient is as yet  
 36065 inaccessible to the *talk* utility. The environment of the invoking party is irrelevant.
- 36066 • Subsequent communication between the two parties cannot be internationalized because the  
 36067 two parties may specify different languages in their environment (and non-portable  
 36068 characters cannot be mapped from one language to another).
- 36069 • Neither party can be required to communicate in a language other than C and/or the one  
 36070 specified by their environment because unavailable terminal hardware support (for example,  
 36071 fonts) may be required.

36072 The text in the STDOUT section reflects the usage of the verb “display” in this section; some *talk*  
 36073 implementations actually use standard output to write to the terminal, but this volume of

- 36074 IEEE Std. 1003.1-200x does not require that to be the case.
- 36075 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
36076 require that they all use or accept the same format.
- 36077 The handling of non-printable characters is partially implementation-dependent because the  
36078 details of mapping them to printable sequences is not needed by the user. Historical  
36079 implementations, for security reasons, disallow the transmission of non-printable characters that  
36080 may send commands to the other terminal.
- 36081 **FUTURE DIRECTIONS**
- 36082 None.
- 36083 **SEE ALSO**

- 36086 **CHANGE HISTORY**
- 36087 First released in Issue 4.
- 36088 **Issue 6**
- 36089 This utility is now marked as part of the User Portability Utilities option.

36090 **NAME**

36091           tee — duplicate standard input

36092 **SYNOPSIS**36093           tee [-ai][*file...*]36094 **DESCRIPTION**36095           The *tee* utility shall copy standard input to standard output, making a copy in zero or more files.36096           The *tee* utility shall not buffer output.

36097           The options determine whether the specified files are overwritten or appended to.

36098 **OPTIONS**36099           The *tee* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
36100           Section 12.2, Utility Syntax Guidelines.

36101           The following options shall be supported:

36102           -a           Append the output to the files rather than overwriting them.

36103           -i           Ignore the SIGINT signal.

36104 **OPERANDS**

36105           The following operands shall be supported:

36106           *file*        A path name of an output file. Processing of at least 13 *file* operands shall be  
36107           supported.36108 **STDIN**

36109           The standard input can be of any type.

36110 **INPUT FILES**

36111           None.

36112 **ENVIRONMENT VARIABLES**36113           The following environment variables shall affect the execution of *tee*:36114           *LANG*        Provide a default value for the internationalization variables that are unset or null.  
36115                            If *LANG* is unset or null, the corresponding value from the implementation-  
36116                            dependent default locale shall be used. If any of the internationalization variables  
36117                            contains an invalid setting, the utility shall behave as if none of the variables had  
36118                            been defined.36119           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
36120                            internationalization variables.36121           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
36122                            characters (for example, single-byte as opposed to multi-byte characters in  
36123                            arguments).36124           *LC\_MESSAGES*36125                           Determine the locale that should be used to affect the format and contents of  
36126                            diagnostic messages written to standard error.36127 XSI       *NLS\_PATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.36128 **ASYNCHRONOUS EVENTS**

36129           Default, except that if the -i option was specified, SIGINT shall be ignored.

**36130 STDOUT**

36131 The standard output shall be a copy of the standard input.

**36132 STDERR**

36133 Used only for diagnostic messages.

**36134 OUTPUT FILES**

36135 If any *file* operands are specified, the standard input shall be copied to each named file.

**36136 EXTENDED DESCRIPTION**

36137 None.

**36138 EXIT STATUS**

36139 The following exit values shall be returned:

36140 0 The standard input was successfully copied to all output files.

36141 >0 An error occurred.

**36142 CONSEQUENCES OF ERRORS**

36143 If a write to any successfully opened *file* operand fails, writes to other successfully opened *file*  
36144 operands and standard output shall continue, but the exit status shall be non-zero. Otherwise,  
36145 the default actions specified in Section 1.11 on page 25 apply.

**36146 APPLICATION USAGE**

36147 The *tee* utility is usually used in a pipeline, to make a copy of the output of some utility.

36148 The *file* operand is technically optional, but *tee* is no more useful than *cat* when none is specified.

**36149 EXAMPLES**

36150 Save an unsorted intermediate form of the data in a pipeline:

36151 ... | tee unsorted | sort > sorted

**36152 RATIONALE**

36153 The buffering requirement means that *tee* is not allowed to use ISO C standard fully buffered or  
36154 line-buffered writes. It does not mean that *tee* has to do 1-byte reads followed by 1-byte writes.

36155 It should be noted that early versions of BSD ignore any invalid options and accept a single '-'  
36156 as an alternative to -i. They also print a message if unable to open a file:

36157 "tee: cannot access %s\n", <pathname>

36158 Historical implementations ignore write errors. This is explicitly not permitted by this volume of  
36159 IEEE Std. 1003.1-200x.

36160 Some historical implementations use O\_APPEND when providing append mode; others use the  
36161 *lseek()* function to seek to the end of file after opening the file without O\_APPEND. This volume  
36162 of IEEE Std. 1003.1-200x requires functionality equivalent to using O\_APPEND; see Section  
36163 1.7.1.4 on page 11.

**36164 FUTURE DIRECTIONS**

36165 None.

**36168 CHANGE HISTORY**

36169 First released in Issue 2.

36170 **Issue 4**

36171 Aligned with the ISO/IEC 9945-2: 1993 standard.

36172 **NAME**

36173       test — evaluate expression

36174 **SYNOPSIS**36175       test [*expression*]36176       [ [*expression*] ]36177 **DESCRIPTION**

36178       The *test* utility shall evaluate the *expression* and indicates the result of the evaluation by its exit  
 36179       status. An exit status of zero indicates that the expression evaluated as true and an exit status of  
 36180       1 indicates that the expression evaluated as false.

36181       In the second form of the utility, which uses "[ ]" rather than *test*, the application shall ensure  
 36182       that the square brackets are separate arguments.

36183 **OPTIONS**

36184       The *test* utility shall not recognize the "—" argument in the manner specified by guideline 10 in  
 36185       the System Interface Definitions volume of IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax  
 36186       Guidelines.

36187       No options shall be supported.

36188 **OPERANDS**

36189       The application shall ensure that all operators and elements of primaries are presented as  
 36190       separate arguments to the *test* utility.

36191       The following primaries can be used to construct *expression*:

36192       **-b file**       True if *file* exists and is a block special file.

36193       **-c file**       True if *file* exists and is a character special file.

36194       **-d file**       True if *file* exists and is a directory.

36195       **-e file**       True if *file* exists.

36196       **-f file**       True if *file* exists and is a regular file.

36197       **-g file**       True if *file* exists and its set group ID flag is set.

36198       **-h file**       True if *file* exists and is a symbolic link.

36199       **-n string**     True if the length of *string* is non-zero.

36200       **-p file**       True if *file* is a named pipe (FIFO).

36201       **-r file**       True if *file* exists and is readable. True shall indicate that permission to read from  
 36202       *file* will be granted, as defined in Section 1.7.1.4 on page 11.

36203       **-s file**       True if *file* exists and has a size greater than zero.

36204       **-t file\_descriptor**

36205       True if the file whose file descriptor number is *file\_descriptor* is open and is  
 36206       associated with a terminal.

36207       **-u file**       True if *file* exists and its set-user-ID flag is set.

36208       **-w file**       True if *file* exists and is writable. True shall indicate that permission to write from  
 36209       *file* will be granted, as defined in Section 1.7.1.4 on page 11.

36210       **-x file**       True if *file* exists and is executable. True if *file* exists and is executable. True shall  
 36211       indicate that permission to execute *file* will be granted, as defined in Section 1.7.1.4  
 36212       on page 11. If *file* is a directory, true shall indicate that permission to search *file*

36213

will be granted.

36214

-z string

True if the length of string *string* is zero.

36215

string

True if the string *string* is not the null string.

36216

s1 = s2

True if the strings *s1* and *s2* are identical.

36217

s1 != s2

True if the strings *s1* and *s2* are not identical.

36218

n1 -eq n2

True if the integers *n1* and *n2* are algebraically equal.

36219

n1 -ne n2

True if the integers *n1* and *n2* are not algebraically equal.

36220

n1 -gt n2

True if the integer *n1* is algebraically greater than the integer *n2*.

36221

n1 -ge n2

True if the integer *n1* is algebraically greater than or equal to the integer *n2*.

36222

n1 -lt n2

True if the integer *n1* is algebraically less than the integer *n2*.

36223

n1 -le n2

True if the integer *n1* is algebraically less than or equal to the integer *n2*.

36224 XSI

expression1 -a expression2

True if both *expression1* and *expression2* are true. The -a binary primary is left

36225

associative. It has a higher precedence than -o.

36226

36227 XSI

expression1 -o expression2

True if either *expression1* or *expression2* is true. The -o binary primary is left

36228

associative.

36229

36230

With the exception of the -h file primary, if a file argument is a symbolic link, test shall evaluate

36231

the expression by resolving the symbolic link and using the file referenced by the link.

36232

These primaries can be combined with the following operators:

36233

! expression

True if *expression* is false.

36234 XSI

( expression )

True if *expression* is true. The parentheses can be used to alter the normal

36235

precedence and associativity.

36236

The primaries with two elements of the form:

36237

-primary\_operator primary\_operand

36238

are known as unary primaries. The primaries with three elements in either of the two forms:

36239

primary\_operand -primary\_operator primary\_operand

36240

primary\_operand primary\_operator primary\_operand

36241

are known as binary primaries. Additional implementation-dependent operators and

36242

primary\_operators may be provided by implementations. They shall be of the form -operator

36243

where the first character of operator is not a digit.

36244

The algorithm for determining the precedence of the operators and the return value that shall be

36245

generated is based on the number of arguments presented to test. (However, when using the

36246

" [ . . . ] " form, the right-bracket final argument shall not be counted in this algorithm.)

36247

In the following list, \$1, \$2, \$3, and \$4 represent the arguments presented to test:

36248

0 arguments:

Exit false (1).

36249

1 argument:

Exit true (0) if \$1 is not null; otherwise, exit false.

36250

2 arguments:

• If \$1 is '!', exit true if \$2 is null, false if \$2 is not null.

|       |                              |                                                                                                                                                                                                                                                                                                                                                                  |
|-------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 36251 |                              | • If \$1 is a unary primary, exit true if the unary test is true, false if the unary test is false.                                                                                                                                                                                                                                                              |
| 36252 |                              |                                                                                                                                                                                                                                                                                                                                                                  |
| 36253 |                              | • Otherwise, produce unspecified results.                                                                                                                                                                                                                                                                                                                        |
| 36254 | 3 arguments:                 | • If \$2 is a binary primary, perform the binary test of \$1 and \$3.                                                                                                                                                                                                                                                                                            |
| 36255 |                              | • If \$1 is ' ! ', negate the two-argument test of \$2 and \$3.                                                                                                                                                                                                                                                                                                  |
| 36256 | MAN                          | • If \$1 is ' ( ' and \$3 is ' ) ', perform the unary test of \$2.                                                                                                                                                                                                                                                                                               |
| 36257 |                              | • Otherwise, produce unspecified results.                                                                                                                                                                                                                                                                                                                        |
| 36258 | 4 arguments:                 | • If \$1 is ' ! ', negate the three-argument test of \$2, \$3, and \$4.                                                                                                                                                                                                                                                                                          |
| 36259 | XSI                          | • If \$1 is ' ( ' and \$4 is ' ) ', perform the two-argument test of \$2 and \$3.                                                                                                                                                                                                                                                                                |
| 36260 |                              | • Otherwise, the results are unspecified.                                                                                                                                                                                                                                                                                                                        |
| 36261 | XSI                          | >4 arguments: Combinations of primaries and operators shall be evaluated using the precedence and associativity rules described previously. In addition, the string comparison binary primaries '=' and '!=' shall have a higher precedence than any unary primary.                                                                                              |
| 36262 |                              |                                                                                                                                                                                                                                                                                                                                                                  |

| 36290 |                              | Used only for diagnostic messages.                                                                                                                                                                                                                                                                                                                               |

36291 **OUTPUT FILES**

36292 None.

36293 **EXTENDED DESCRIPTION**

36294 None.

36295 **EXIT STATUS**

36296 The following exit values shall be returned:

36297 0 *expression* evaluated to true.36298 1 *expression* evaluated to false or *expression* was missing.

36299 &gt;1 An error occurred.

36300 **CONSEQUENCES OF ERRORS**

36301 Default.

36302 **APPLICATION USAGE**

36303 Scripts should be careful when dealing with user-supplied input that could be confused with  
 36304 primaries and operators. Unless the application writer knows all the cases that produce input to  
 36305 the script, invocations like:

36306 `test "$1" -a "$2"`

36307 should be written as:

36308 `test "$1" && test "$2"`

36309 to avoid problems if a user supplied values such as \$1 set to '!' and \$2 set to the null string.  
 36310 That is, in cases where maximal portability is of concern, replace:

36311 `test expr1 -a expr2`

36312 with:

36313 `test expr1 && test expr2`

36314 and replace:

36315 `test expr1 -o expr2`

36316 with:

36317 `test expr1 || test expr2`

36318 but note that, in *test*, `-a` has higher precedence than `-o` while `"&&"` and `"||"` have equal  
 36319 precedence in the shell.

36320 Parentheses or braces can be used in the shell command language to effect grouping.

36321 Parentheses must be escaped when using *sh*; for example:36322 `test \( expr1 -a expr2 \) -o expr3`

36323 This command is not always portable outside XSI-conformant systems. The following form can  
 36324 be used instead:

36325 `( test expr1 && test expr2 ) || test expr3`

36326 The two commands:

36327 `test "$1"`36328 `test ! "$1"`

36329 could not be used reliably on some historical systems. Unexpected results would occur if such a  
 36330 *string* expression were used and \$1 expanded to '!', '(', or a known unary primary. Better  
 36331 constructs are:

36332 test -n "\$1"  
 36333 test -z "\$1"

36334 respectively.

36335 Historical systems have also been unreliable given the common construct:

36336 test "\$response" = "expected string"

36337 One of the following is a more reliable form:

36338 test "X\$response" = "Xexpected string"  
 36339 test "expected string" = "\$response"

36340 Note that the second form assumes that *expected string* could not be confused with any unary  
 36341 primary. If *expected string* starts with '-', '(', '!', or even '=', the first form should be used  
 36342 instead. Using the preceding rules without the marked extensions, any of the three comparison  
 36343 forms is reliable, given any input. (However, note that the strings are quoted in all cases.)

36344 Because the string comparison binary primaries, '=' and '!=', have a higher precedence than  
 36345 any unary primary in the greater than 4 argument case, unexpected results can occur if  
 36346 arguments are not properly prepared. For example, in:

36347 test -d \$1 -o -d \$2

36348 If \$1 evaluates to a possible directory name of '=', the first three arguments are considered a  
 36349 string comparison, which shall cause a syntax error when the second -d is encountered. One of  
 36350 the following forms prevents this; the second is preferred:

36351 test \( -d "\$1" \) -o \( -d "\$2" \)  
 36352 test -d "\$1" || test -d "\$2"

36353 Also in the greater than 4 argument case:

36354 test "\$1" = "bat" -a "\$2" = "ball"

36355 Syntax errors occur if \$1 evaluates to '(' or '!'. One of the following forms prevents this; the  
 36356 third is preferred:

36357 test "X\$1" = "Xbat" -a "X\$2" = "Xball"  
 36358 test "\$1" = "bat" && test "\$2" = "ball"  
 36359 test "X\$1" = "Xbat" && test "X\$2" = "Xball"

## 36360 EXAMPLES

36361 1. Exit if there are not two or three arguments (two variations):

36362 if [ \$# -ne 2 -a \$# -ne 3 ]; then exit 1; fi  
 36363 if [ \$# -lt 2 -o \$# -gt 3 ]; then exit 1; fi

36364 2. Perform a *mkdir* if a directory does not exist:

36365 test ! -d tempdir && mkdir tempdir

36366 3. Wait for a file to become non-readable:

36367 while test -r thefile  
 36368 do  
 36369 sleep 30

```

36370 done
36371 echo '"thefile" is no longer readable'
36372
36373 4. Perform a command if the argument is one of three strings (two variations):
36374
36375 if ["$1" = "pear"] || ["$1" = "grape"] || ["$1" = "apple"]
36376 then
36377 command
36378 fi
36379
36380 case "$1" in
36381 pear|grape|apple) command ;;
36382 esac

```

#### 36380 RATIONALE

36381 The KornShell-derived conditional command (double bracket `[[ ]]`) was removed from the shell  
 36382 command language description in an early proposal. Objections were raised that the real  
 36383 problem is misuse of the `test` command (`I`), and putting it into the shell is the wrong way to fix  
 36384 the problem. Instead, proper documentation and a new shell reserved word (`!`) are sufficient.

36385 Tests that require multiple *test* operations can be done at the shell level using individual  
 36386 invocations of the *test* command and shell logicals, rather than using the error-prone `-o` flag of  
 36387 *test*.

36388 XSI-conformant systems support more than four arguments.

36389 XSI-conformant systems support the combining of primaries with the following constructs:

36390 *expression1* **-a** *expression2*  
 36391 True if both *expression1* and *expression2* are true.

36392 *expression1* **-o** *expression2*  
 36393 True if at least one of *expression1* and *expression2* are true.

36394 (*expression*)  
 36395 True if *expression* is true.

36396 In evaluating these more complex combined expressions, the following precedence rules are  
 36397 used:

- 36398 • The unary primaries have higher precedence than the algebraic binary primaries.
- 36399 • The unary primaries have lower precedence than the string binary primaries.
- 36400 • The unary and binary primaries have higher precedence than the unary *string* primary.
- 36401 • The `!` operator has higher precedence than the `-a` operator, and the `-a` operator has higher  
 36402 precedence than the `-o` operator.
- 36403 • The `-a` and `-o` operators are left associative.
- 36404 • The parentheses can be used to alter the normal precedence and associativity.

36405 The BSD and System V versions of `-f` are not the same. The BSD definition was:

36406 **-f** *file* True if *file* exists and is not a directory.

36407 The SVID version (true if the file exists and is a regular file) was chosen for this volume of  
 36408 IEEE Std. 1003.1-200x because its use is consistent with the `-b`, `-c`, `-d`, and `-p` operands (*file*  
 36409 exists and is a specific file type).

36410 The `-e` primary, possessing similar functionality to that provided by the C shell, was added  
 36411 because it provides the only way for a shell script to find out if a file exists without trying to

open the file. Since implementations are allowed to add additional file types, a portable script cannot use:

```
test -b foo -o -c foo -o -d foo -o -f foo -o -p foo
```

to find out if **foo** is an existing file.) On historical BSD systems, the existence of a file could be determined by:

```
test -f foo -o -d foo
```

but there was no easy way to determine that an existing file was a regular file. An early proposal used the KornShell **-a** primary (with the same meaning), but this was changed to **-e** because there were concerns about the high probability of humans confusing the **-a** primary with the **-a** binary operator.

The **-a** and **-o** binary operators and the grouping parentheses were omitted from this volume of IEEE Std. 1003.1-200x due to a difference between historical implementations of the *test* utility in the precedence of the binary primaries **'='** and **"!="** compared to the unary primaries **-b**, **-c**, **-d**, **-f**, **-g**, **-n**, **-p**, **-r**, **-s**, **-t**, **-u**, **-w**, **-x**, and **-z**. On BSD, Version 7, PWB, and 32V systems, the unary primaries have higher precedence than the binary operators; on System III and System V implementations, the binary operators **'='** and **"!="** have higher precedence. The change was apparently made for System III so that the construct:

```
test "$1" = "$2"
```

could be made to work even if \$1 started with **'-'**. This change was considered a mistake because:

- It is not a complete solution; if \$1 expands to **'( ' or '!''**, it still does not work.
- It makes it impossible to use the unary primaries **-n** and **-z** to test for a null string if there is any chance that the string will expand to **'='**.
- More importantly, there was the well known option of specifying:

```
test X"$1" = X"$2"
```

that always worked.

Unfortunately, when the **'='** and **"!="** binary primaries were given precedence over the unary primaries, there was no solution provided for scripts that wanted to reliably specify something like:

```
test -n "$1"
```

because if \$1 expands to **'='**, it gives a syntax error.

There was some discussion of forbidding the System V behavior and requiring the more logical precedence that originated in its predecessors and that remains in BSD-based systems. However, there are simply too many historical applications that would break if System V were required to make this change; this number dwarfed the number of scripts using combination logic that would then no longer be strictly portable.

This volume of IEEE Std. 1003.1-200x requires that if *test* is called with one, two, three, or four operands it correctly interprets the expression even if there is an alternate syntax tree that could lead to a syntax error. It eliminates the requirement that many string comparisons be protected with leading characters, such as:

```
test X"$1" = X"$2"
```

and allows the single-argument *string* form to be used with all possible inputs.

36454 The following examples show some of the changes that are required to be made to make  
 36455 historical BSD and System V-based implementations of *test* conform to this volume of  
 36456 IEEE Std. 1003.1-200x:

```
36457 test -d = POSIX.2 True if there is a directory named =.

36458 BSD True if there is a directory named =.

36459 System V Syntax error; = needs two operands.
```

```
36460 test -d = -f POSIX.2 False

36461 BSD Syntax error; it expects -a or -o after -d =.

36462 System V False
```

36463 Implementations are prohibited from extending *test* with options because it would make the *test*  
 36464 *string* case ambiguous for inputs that might match an extended option. Implementations can  
 36465 add primaries and operators, as indicated.

36466 The following options were not included in this volume of IEEE Std. 1003.1-200x, although they  
 36467 are provided by some historical implementations, since these facilities and concepts are not  
 36468 supported by the System Interfaces volume of IEEE Std. 1003.1-200x nor defined in this volume  
 36469 of IEEE Std. 1003.1-200x. These operands should not be used by new implementations for other  
 36470 purposes.

```
36471 -h file True if file exists and is a symbolic link.

36472 -k file True if file exists and its sticky bit is set.

36473 -L file True if file is a symbolic link.

36474 -C file True if file is a contiguous file.

36475 -S file True if file is a socket.

36476 -V file True if file is a version file.
```

36477 The following option was not included because it was undocumented in most implementations,  
 36478 has been removed from some implementations (including System V), and the functionality is  
 36479 provided by the shell (see Section 2.6.2 on page 51).

```
36480 -l string The length of the string string.
```

36481 The **-b**, **-c**, **-g**, **-p**, **-u**, and **-x** operands are derived from the SVID; historical BSD does not  
 36482 provide them. The **-k** operand is derived from System V; historical BSD does not provide it.

36483 On historical BSD systems, *test -w directory* always returned false because *test* tried to open the  
 36484 directory for writing, which always fails.

36485 Some additional primaries newly invented or from the KornShell appeared in an early proposal  
 36486 as part of the conditional command ([[]]): *s1 > s2*, *s1 < s2*, *str = pattern*, *str != pattern*, *f1 -nt f2*, *f1*  
 36487 *-ot f2*, and *f1 -ef f2*. They were not carried forward into the *test* utility when the conditional  
 36488 command was removed from the shell because they have not been included in the *test* utility  
 36489 built into historical implementations of the *sh* utility.

36490 The **-t file\_descriptor** primary is shown with a mandatory argument because the grammar is  
 36491 ambiguous if it can be omitted. Historical implementations have allowed it to be omitted,  
 36492 providing a default of 1.

#### 36493 FUTURE DIRECTIONS

36494 None.

| 36497 | <b>CHANGE HISTORY</b>                                                                                   |  |
| 36498 | First released in Issue 2.                                                                              |  |
| 36499 | <b>Issue 4</b>                                                                                          |  |
| 36500 | Aligned with the ISO/IEC 9945-2: 1993 standard.                                                         |  |
| 36501 | <b>Issue 5</b>                                                                                          |  |
| 36502 | FUTURE DIRECTIONS section added.                                                                        |  |
| 36503 | <b>Issue 6</b>                                                                                          |  |
| 36504 | The <b>-h</b> operand is added for symbolic links, and access permission requirements are clarified for |  |
| 36505 | the <b>-r</b> , <b>-w</b> , and <b>-x</b> operands to align with the IEEE P1003.2b draft standard.      |  |
| 36506 | The normative text is reworded to avoid use of the term “must” for application requirements.            |  |

36507 **NAME**

36508           time — time a simple command

36509 **SYNOPSIS**36510 UP       time [-p] *utility* [*argument...*]

36511

36512 **DESCRIPTION**

36513       The *time* utility shall invoke the utility named by the *utility* operand with arguments supplied as  
 36514       the *argument* operands and write a message to standard error that lists timing statistics for the  
 36515       utility. The message shall include the following information:

- 36516           • The elapsed (real) time between invocation of *utility* and its termination.
- 36517           • The User CPU time, equivalent to the sum of the *tms\_utime* and *tms\_cutime* fields returned by  
 36518           the *times()* function defined in the System Interfaces volume of IEEE Std. 1003.1-200x for the  
 36519           process in which *utility* is executed.
- 36520           • The System CPU time, equivalent to the sum of the *tms\_stime* and *tms\_cstime* fields returned  
 36521           by the *times()* function for the process in which *utility* is executed.

36522       The precision of the timing shall be no less than the granularity defined for the size of the clock  
 36523       tick unit on the system, but the results shall be reported in terms of standard time units (for  
 36524       example, 0.02 seconds, 00:00:00.02, 1m33.75s, 365.21 seconds), not numbers of clock ticks.

36525       When *time* is used as part of a pipeline, the times reported are unspecified, except when it is the  
 36526       sole command within a grouping command (see Section 2.9.4.1 on page 75) in that pipeline. For  
 36527       example, the commands on the left are unspecified; those on the right report on utilities **a** and **c**,  
 36528       respectively:

```
36529 time a | b | c { time a } | b | c
36530 a | b | time c a | b | (time c)
```

36531 **OPTIONS**

36532       The *time* utility shall conform to the System Interface Definitions volume of |  
 36533       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines. |

36534       The following option shall be supported:

36535       **-p**           Write the timing output to standard error in the format shown in the STDERR  
 36536       section.

36537 **OPERANDS**

36538       The following operands shall be supported:

36539       *utility*       The name of a utility that is to be invoked. If the *utility* operand names any of the  
 36540       special built-in utilities in Section 2.14 on page 96, the results are undefined.

36541       *argument*     Any string to be supplied as an argument when invoking the utility named by the  
 36542       *utility* operand.

36543 **STDIN**

36544       Not used.

36545 **INPUT FILES**

36546       None.

36547 **ENVIRONMENT VARIABLES**

36548 The following environment variables shall affect the execution of *time*:

36549 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 36550 If *LANG* is unset or null, the corresponding value from the implementation-  
 36551 dependent default locale shall be used. If any of the internationalization variables  
 36552 contains an invalid setting, the utility shall behave as if none of the variables had  
 36553 been defined.

36554 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 36555 internationalization variables.

36556 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 36557 characters (for example, single-byte as opposed to multi-byte characters in  
 36558 arguments).

36559 **LC\_MESSAGES**  
 36560 Determine the locale that should be used to affect the format and contents of  
 36561 diagnostic and informative messages written to standard error.

36562 **LC\_NUMERIC**  
 36563 Determine the locale for numeric formatting.

36564 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36565 **PATH** Determine the search path that shall be used to locate the utility to be invoked; see  
 36566 the System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 8,  
 36567 Environment Variables.

36568 **ASYNCHRONOUS EVENTS**

36569 Default.

36570 **STDOUT**

36571 Not used.

36572 **STDERR**

36573 The standard error shall be used to write the timing statistics. If **-p** is specified, the following  
 36574 format shall be used in the POSIX locale:

36575 "real %f\nuser %f\nsys %f\n", <real seconds>, <user seconds>,  
 36576 <system seconds>

36577 where each floating-point number shall be expressed in seconds. The precision used may be less  
 36578 than the default six digits of %f, but shall be sufficiently precise to accommodate the size of the  
 36579 clock tick on the system (for example, if there were 60 clock ticks per second, at least two digits  
 36580 shall follow the radix character). The number of digits following the radix character shall be no  
 36581 less than one, even if this always results in a trailing zero. The implementation may append  
 36582 white space and additional information following the format shown here.

36583 **OUTPUT FILES**

36584 None.

36585 **EXTENDED DESCRIPTION**

36586 None.

36587 **EXIT STATUS**

36588 If the *utility* utility is invoked, the exit status of *time* shall be the exit status of *utility*; otherwise,  
 36589 the *time* utility shall exit with one of the following values:

- 36590 1-125 An error occurred in the *time* utility.
- 36591 126 The utility specified by *utility* was found but could not be invoked.
- 36592 127 The utility specified by *utility* could not be found.

### 36593 CONSEQUENCES OF ERRORS

36594 Default.

### 36595 APPLICATION USAGE

36596 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
 36597 an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
 36598 utility exited with an error indication”. The value 127 was chosen because it is not commonly  
 36599 used for other meanings; most utilities use small values for “normal error conditions” and the  
 36600 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 36601 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 36602 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 36603 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 36604 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
 36605 any other reason.

36606 Application writers should note that this utility need not be provided on systems that do not  
 36607 support the User Portability Utilities option.

### 36608 EXAMPLES

36609 It is frequently desirable to apply *time* to pipelines or lists of commands. This can be done by  
 36610 placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
 36611 the *time* applies to everything in the file.

36612 Alternatively, the following command can be used to apply *time* to a complex command:

36613 `time sh -c 'complex-command-line'`

### 36614 RATIONALE

36615 The *time* utility when originally proposed for this volume of IEEE Std. 1003.1-200x, was rejected  
 36616 because it was not useful for portable applications:

- 36617 • The underlying CPU definitions from the System Interfaces volume of IEEE Std. 1003.1-200x  
 36618 are vague, so the numeric output could not be compared accurately between systems or even  
 36619 between invocations.
- 36620 • The creation of portable benchmark programs was outside the scope this volume of  
 36621 IEEE Std. 1003.1-200x.

36622 However, *time* does fit in the scope of user portability. Human judgement can be applied to the  
 36623 analysis of the output, and it could be very useful in hands-on debugging of applications or in  
 36624 providing subjective measures of system performance. Hence it has been included in this  
 36625 volume of IEEE Std. 1003.1-200x.

36626 The default output format has been left unspecified because historical implementations differ  
 36627 greatly in their style of depicting this numeric output. The **-p** option was invented to provide  
 36628 scripts a common means of obtaining this information.

36629 In the KornShell, *time* is a shell reserved word that can be used to time an entire pipeline, rather  
 36630 than just a simple command. The POSIX definition has been worded to allow this  
 36631 implementation. Consideration was given to invalidating this approach because of the historical  
 36632 model from the C shell and System V shell. However, since the System V *time* utility historically  
 36633 has not produced accurate results in pipeline timing (because the constituent processes are not  
 36634 all owned by the same parent process, as allowed by POSIX), it did not seem worthwhile to

- 36635 break historical KornShell usage.
- 36636 The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
36637 commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*  
36638 includes user application programs and shell scripts, not just the standard utilities.
- 36639 **FUTURE DIRECTIONS**
- 36640 None.

- 36648 This utility is now marked as part of the User Portability Utilities option.

36649 **NAME**

36650 touch — change file access and modification times

36651 **SYNOPSIS**36652 touch [-acm][ -r *ref\_file*| -t *time*] *file*...36653 **DESCRIPTION**

36654 The *touch* utility shall change the modification times, access times, or both of files. The  
 36655 modification time shall be equivalent to the value of the *st\_mtime* member of the **stat** structure  
 36656 for a file, as described in the System Interfaces volume of IEEE Std. 1003.1-200x; the access time  
 36657 shall be equivalent to the value of *st\_atime*.

36658 The time used can be specified by the -t *time* option-argument, the corresponding time fields of  
 36659 the file referenced by the -r *ref\_file* option-argument, or the *date\_time* operand, as specified in the  
 36660 following sections. If none of these are specified, *touch* shall use the current time (the value  
 36661 returned by the equivalent of the *time()* function defined in the System Interfaces volume of  
 36662 IEEE Std. 1003.1-200x).

36663 For each *file* operand, *touch* shall perform actions equivalent to the following functions defined  
 36664 in the System Interfaces volume of IEEE Std. 1003.1-200x:

- 36665 1. If *file* does not exist, a *creat()* function call is made with the *file* operand used as the *path*  
 36666 argument and the value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP,  
 36667 S\_IWGRP, S\_IROTH, and S\_IWOTH used as the *mode* argument.
- 36668 2. The *utime()* function is called with the following arguments:
  - 36669 a. The *file* operand is used as the *path* argument.
  - 36670 b. The **utimbuf** structure members *actime* and *modtime* are determined as described in  
 36671 the OPTIONS section.

36672 **OPTIONS**

36673 The *touch* utility shall conform to the System Interface Definitions volume of  
 36674 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

36675 The following options shall be supported:

- |                |                           |                                                                                                                             |
|----------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| 36676<br>36677 | <b>-a</b>                 | Change the access time of <i>file</i> . Do not change the modification time unless <b>-m</b> is also specified.             |
| 36678<br>36679 | <b>-c</b>                 | Do not create a specified <i>file</i> if it does not exist. Do not write any diagnostic messages concerning this condition. |
| 36680<br>36681 | <b>-m</b>                 | Change the modification time of <i>file</i> . Do not change the access time unless <b>-a</b> is also specified.             |
| 36682<br>36683 | <b>-r <i>ref_file</i></b> | Use the corresponding time of the file named by the path name <i>ref_file</i> instead of the current time.                  |
| 36684<br>36685 | <b>-t <i>time</i></b>     | Use the specified <i>time</i> instead of the current time. The option-argument shall be a decimal number of the form:       |
| 36686          |                           | [ [ <i>CC</i> ] <i>YY</i> ] <i>MMDDhhmm</i> [ . <i>SS</i> ]                                                                 |
| 36687          |                           | where each two digits represents the following:                                                                             |
| 36688          | <i>MM</i>                 | The month of the year [01-12].                                                                                              |
| 36689          | <i>DD</i>                 | The day of the month [01-31].                                                                                               |

36690 *hh* The hour of the day [00-23].

36691 *mm* The minute of the hour [00-59].

36692 *CC* The first two digits of the year (the century).

36693 *YY* The second two digits of the year.

36694 *SS* The second of the minute [00-61].

36695 Both *CC* and *YY* shall be optional. If neither is given, the current year shall be  
36696 assumed. If *YY* is specified, but *CC* is not, *CC* shall be derived as follows:

|       |                  |                    |
|-------|------------------|--------------------|
| 36697 | <b>If YY is:</b> | <b>CC becomes:</b> |
| 36698 | 69-99            | 19                 |
| 36699 | 00-68            | 20                 |

36700 The resulting time shall be affected by the value of the *TZ* environment variable. If  
36701 the resulting time value precedes the Epoch, *touch* shall exit immediately with an  
36702 error status. The range of valid times past the Epoch is implementation-dependent,  
36703 MAN but it shall extend to at least the time 0 hours, 0 minutes, 0 seconds, January 1,  
36704 2038, Coordinated Universal Time. Some systems may not be able to represent  
36705 dates beyond the January 18, 2038, because they use **signed int** as a time holder.

36706 The range for *SS* is (00-61) rather than (00-59) because of leap seconds. If *SS* is 60 or  
36707 61, and the resulting time, as affected by the *TZ* environment variable, does not  
36708 refer to a leap second, the resulting time shall be one or two seconds after a time  
36709 where *SS* is 59. If *SS* is not given a value, it is assumed to be zero.

36710 If neither the **-a** nor **-m** options were specified, *touch* shall behave as if both the **-a** and **-m**  
36711 options were specified.

## 36712 OPERANDS

36713 The following operands shall be supported:

36714 *file* A path name of a file whose times shall be modified. |

## 36715 STDIN

36716 Not used.

## 36717 INPUT FILES

36718 None.

## 36719 ENVIRONMENT VARIABLES

36720 The following environment variables shall affect the execution of *touch*:

36721 *LANG* Provide a default value for the internationalization variables that are unset or null.  
36722 If *LANG* is unset or null, the corresponding value from the implementation-  
36723 dependent default locale shall be used. If any of the internationalization variables  
36724 contains an invalid setting, the utility shall behave as if none of the variables had  
36725 been defined.

36726 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
36727 internationalization variables.

36728 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
36729 characters (for example, single-byte as opposed to multi-byte characters in  
36730 arguments).

36731 *LC\_MESSAGES*

36732 Determine the locale that should be used to affect the format and contents of

36733 diagnostic messages written to standard error.

36734 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36735 **TZ** Determine the timezone to be used for interpreting the *time* option-argument.

36736 **ASYNCHRONOUS EVENTS**

36737 Default.

36738 **STDOUT**

36739 Not used.

36740 **STDERR**

36741 Used only for diagnostic messages.

36742 **OUTPUT FILES**

36743 None.

36744 **EXTENDED DESCRIPTION**

36745 None.

36746 **EXIT STATUS**

36747 The following exit values shall be returned:

36748 0 The utility executed successfully and all requested changes were made.

36749 >0 An error occurred.

36750 **CONSEQUENCES OF ERRORS**

36751 Default.

36752 **APPLICATION USAGE**

36753 The interpretation of time is taken to be *seconds since the Epoch* (see the System Interface  
 36754 Definitions volume of IEEE Std. 1003.1-200x, Section 3.342, Seconds Since the Epoch). It should  
 36755 be noted that implementations conforming to the System Interfaces volume of  
 36756 IEEE Std. 1003.1-200x do not take leap seconds into account when computing seconds since the  
 36757 Epoch. When SS=60 is used, the resulting time always refers to 1 plus *seconds since the Epoch* for a  
 36758 time when SS=59.

36759 Although the **-t time** option-argument and the obsolescent *date\_time* operand specify values in  
 36760 1969, the access time and modification time fields are defined in terms of seconds since the  
 36761 Epoch (midnight on 1 January 1970 UTC). Therefore, depending on the value of *TZ* when *touch* is  
 36762 run, there is never more than a few valid hours in 1969 and there need not be any valid times in  
 36763 1969.

36764 One ambiguous situation occurs if **-t time** is not specified, **-r ref\_file** is not specified, and the first  
 36765 operand is an eight or ten-digit decimal number. A portable script can avoid this problem by  
 36766 using:

36767 touch -- file

36768 or:

36769 touch ./file

36770 in this case.

36771 **EXAMPLES**

36772 None.

36773 **RATIONALE**

36774 The functionality of *touch* is described almost entirely through references to functions in the  
 36775 System Interfaces volume of IEEE Std. 1003.1-200x. In this way, there is no duplication of effort  
 36776 required for describing such side effects as the relationship of user IDs to the user database,  
 36777 permissions, and so on.

36778 There are some significant differences between the *touch* utility in this volume of  
 36779 IEEE Std. 1003.1-200x and those in System V and BSD systems. They are upward-compatible for  
 36780 historical applications from both implementations:

36781 1. In System V, an ambiguity exists when a path name that is a decimal number leads the  
 36782 operands; it is treated as a time value. In BSD, no *time* value is allowed; files may only be  
 36783 *touched* to the current time. The *-t time* construct solves these problems for future portable  
 36784 applications (note that the *-t* option is not historical practice).

36785 2. The inclusion of the century digits, *CC*, is also new. Note that a ten-digit *time* value is  
 36786 treated as if *YY*, and not *CC*, were specified. The caveat about the range of dates following  
 36787 the Epoch was included as recognition that some implementations are not able to  
 36788 represent dates beyond 18 January 2038 because they use **signed int** as a time holder.

36789 The *-r* option was added because several comments requested this capability. This option was  
 36790 named *-f* in an early proposal, but was changed because the *-f* option is used in the BSD version  
 36791 of *touch* with a different meaning.

36792 At least one historical implementation of *touch* incremented the exit code if *-c* was specified and  
 36793 the file did not exist. This volume of IEEE Std. 1003.1-200x requires exit status zero if no errors  
 36794 occur.

36795 **FUTURE DIRECTIONS**

36796 Applications should use the *-r* or *-t* options.

36797 **SEE ALSO**

36798 *date*, the System Interfaces volume of IEEE Std. 1003.1-200x, *creat()*, *time()*, <sys/stat.h>

36799 **CHANGE HISTORY**

36800 First released in Issue 2.

36801 **Issue 4**

36802 Aligned with the ISO/IEC 9945-2:1993 standard.

36803 **Issue 6**

36804 The obsolescent *date\_time* operand is removed.

36805 The Open Group corrigenda item U027/1 has been applied. This extends the range of valid time  
 36806 past the Epoch to at least the time 0 hours, 0 minutes, 0 seconds, January 1, 2038, Coordinated  
 36807 Universal Time. This is a new requirement on POSIX implementations.

36808 **Notes to Reviewers**

36809 *This section with side shading will not appear in the final copy. - Ed.*

36810 Should leap seconds be 00-61? c9x infers that it is only 00-60, and astronomers confirm that  
 36811 double leap seconds do not occur.

36812 **NAME**

36813           tput — change terminal characteristics

36814 **SYNOPSIS**36815 UP       tput [-T *type*] *operand...*

36816

36817 **DESCRIPTION**

36818       The *tput* utility shall display terminal-dependent information. The manner in which this  
 36819       information is retrieved is unspecified. The information displayed shall clear the terminal screen,  
 36820       initialize the user's terminal, or reset the user's terminal, depending on the operand given. The  
 36821       exact consequences of displaying this information are unspecified.

36822 **OPTIONS**

36823       The *tput* utility shall conform to the System Interface Definitions volume of  
 36824       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

36825       The following option shall be supported:

36826       -T *type*     Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
 36827       is unset or null, an unspecified default terminal type shall be used. The setting of  
 36828       *type* shall take precedence over the value in *TERM*.

36829 **OPERANDS**

36830       The following strings shall be supported as operands by the implementation in the POSIX locale:

36831       **clear**       Display the clear-screen sequence.

36832       **init**        Display the sequence that initializes the user's terminal in an implementation-  
 36833       dependent manner.

36834       **reset**       Display the sequence that resets the user's terminal in an implementation-  
 36835       dependent manner.

36836       If a terminal does not support any of the operations described by these operands, this shall not  
 36837       be considered an error condition.

36838 **STDIN**

36839       Not used.

36840 **INPUT FILES**

36841       None.

36842 **ENVIRONMENT VARIABLES**

36843       The following environment variables shall affect the execution of *tput*:

36844       **LANG**        Provide a default value for the internationalization variables that are unset or null.  
 36845       If *LANG* is unset or null, the corresponding value from the implementation-  
 36846       dependent default locale shall be used. If any of the internationalization variables  
 36847       contains an invalid setting, the utility shall behave as if none of the variables had  
 36848       been defined.

36849       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 36850       internationalization variables.

36851       **LC\_CTYPE**    Determine the locale for the interpretation of sequences of bytes of text data as  
 36852       characters (for example, single-byte as opposed to multi-byte characters in  
 36853       arguments).

36854       **LC\_MESSAGES**

36855       Determine the locale that should be used to affect the format and contents of

36856 diagnostic messages written to standard error.

36857 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36858 **TERM** Determine the terminal type. If this variable is unset or null, and if the **-T** option is  
 36859 not specified, an unspecified default terminal type shall be used.

36860 **ASYNCHRONOUS EVENTS**

36861 Default.

36862 **STDOUT**

36863 If standard output is a terminal device, it may be used for writing the appropriate sequence to  
 36864 clear the screen or reset or initialize the terminal. If standard output is not a terminal device,  
 36865 undefined results occur.

36866 **STDERR**

36867 Used only for diagnostic messages.

36868 **OUTPUT FILES**

36869 None.

36870 **EXTENDED DESCRIPTION**

36871 None.

36872 **EXIT STATUS**

36873 The following exit values shall be returned:

36874 0 The requested string was written successfully.

36875 1 Unspecified.

36876 2 Usage error.

36877 3 No information is available about the specified terminal type.

36878 4 The specified operand is invalid.

36879 >4 An error occurred.

36880 **CONSEQUENCES OF ERRORS**

36881 If one of the operands is not available for the terminal, *tput* continues processing the remaining  
 36882 operands.

36883 **APPLICATION USAGE**

36884 The difference between resetting and initializing a terminal is left unspecified, as they vary  
 36885 greatly based on hardware types. In general, resetting is a more severe action.

36886 Some terminals use control characters to perform the stated functions, and on such terminals it  
 36887 might make sense to use *tput* to store the initialization strings in a file or environment variable  
 36888 for later use. However, because other terminals might rely on system calls to do this work, the  
 36889 standard output cannot be used in a portable manner, such as the following non-portable  
 36890 constructs:

36891 ClearVar='tput clear'  
 36892 tput reset | mailx -s "Wake Up" ddg

36893 Application writers should note that this utility need not be provided on systems that do not  
 36894 support the User Portability Utilities option.

36895 **EXAMPLES**

36896           1. Initialize the terminal according to the type of terminal in the environmental variable  
36897           *TERM*. This command can be included in a **.profile** file.

36898           tput init

36899           2. Reset a 450 terminal.

36900           tput -T 450 reset

36901 **RATIONALE**

36902           The list of operands was reduced to a minimum for the following reasons:

36903           • The only features chosen were those that were likely to be used by human users interacting  
36904           with a terminal.

36905           • Specifying the full *terminfo* set was not considered desirable, but the standard developers did  
36906           not want to select among operands.

36907           • This volume of IEEE Std. 1003.1-200x does not attempt to provide applications with  
36908           sophisticated terminal handling capabilities, as that falls outside of its assigned scope and  
36909           intersects with the responsibilities of other standards bodies.

36910           The difference between resetting and initializing a terminal is left unspecified as this varies  
36911           greatly based on hardware types. In general, resetting is a more severe action.

36912           The exit status of 1 is historically reserved for finding out if a Boolean operand is not set.  
36913           Although the operands were reduced to a minimum, the exit status of 1 should still be reserved  
36914           for the Boolean operands, for those sites that wish to support them.

36915 **FUTURE DIRECTIONS**

36916           None.

36917 **SEE ALSO**

36918           *stty*, *tabs*

36919 **CHANGE HISTORY**

36920           First released in Issue 4.

36921 **Issue 6**

36922           This utility is now marked as part of the User Portability Utilities option.

36923 **NAME**

36924 tr — translate characters

36925 **SYNOPSIS**36926 tr [-c | -C][-s] *string1 string2* |36927 tr -s [-c | -C] *string1* |36928 tr -d [-c | -C] *string1* |36929 tr -ds [-c | -C] *string1 string2* |36930 **DESCRIPTION**

36931 The *tr* utility shall copy the standard input to the standard output with substitution or deletion  
 36932 of selected characters. The options specified and the *string1* and *string2* operands shall control  
 36933 translations that occur while copying characters and single-character collating elements.

36934 **OPTIONS**

36935 The *tr* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 36936 Section 12.2, Utility Syntax Guidelines. |

36937 The following options shall be supported:

36938 **-c** Complement the set of values specified by *string1*. See the EXTENDED  
 36939 DESCRIPTION section. |

36940 **-C** Complement the set of characters specified by *string1*. See the EXTENDED  
 36941 DESCRIPTION section. |

36942 **-d** Delete all occurrences of input characters that are specified by *string1*.

36943 **-s** Replace instances of repeated characters with a single character, as described in the  
 36944 EXTENDED DESCRIPTION section.

36945 **OPERANDS**

36946 The following operands shall be supported:

36947 *string1, string2*

36948 Translation control strings. Each string shall represent a set of characters to be  
 36949 converted into an array of characters used for the translation. For a detailed  
 36950 description of how the strings are interpreted, see the EXTENDED DESCRIPTION  
 36951 section.

36952 **STDIN**

36953 The standard input can be any type of file.

36954 **INPUT FILES**

36955 None.

36956 **ENVIRONMENT VARIABLES**36957 The following environment variables shall affect the execution of *tr*:

36958 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 36959 If *LANG* is unset or null, the corresponding value from the implementation-  
 36960 dependent default locale shall be used. If any of the internationalization variables  
 36961 contains an invalid setting, the utility shall behave as if none of the variables had  
 36962 been defined.

36963 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 36964 internationalization variables.

|       |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 36965 | <b>LC_COLLATE</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 36966 |                             | Determine the locale for the behavior of range expressions and equivalence classes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 36967 | <b>LC_CTYPE</b>             | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments) and the behavior of character classes.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 36968 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 36969 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 36987 | <i>character</i>            | Any character not described by one of the conventions below represents itself.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 36988 | <i>\octal</i>               | Octal sequences can be used to represent characters with specific coded values. An octal sequence shall consist of a backslash followed by the longest sequence of one, two, or three-octal-digit characters (01234567). The sequence shall cause the value whose encoding is represented by the one, two, or three-digit octal integer to be placed into the array. If the size of a byte on the system is greater than nine bits, the valid escape sequence used to represent a byte is implementation-dependent. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading ' <i>\</i> ' for each byte. |

| 37001 | <i>c-c</i>                  | Represents the range of collating elements between the range endpoints (as long as neither endpoint is an octal sequence of the form <i>\octal</i> ), inclusive, as defined by the current setting of the <b>LC_COLLATE</b> locale category. The application shall ensure that the starting endpoint precedes the second endpoint in the current collation order. The characters or collating elements in the range shall be placed in the array in ascending collation sequence.                                                                                                                                                                         |
| 37002 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|-----------|-------------------------|-------------------------------------------------------------------------------------------------------------------------|
| 37010     | [:class:]               | Represents all characters belonging to the defined character class, as defined by the                                   |
| 37011     |                         | current setting of the <i>LC_CTYPE</i> locale category. The following character class                                   |
| 37012     |                         | names shall be accepted when specified in <i>string1</i> :                                                              |
| 37013     |                         | <b>alnum</b> <b>blank</b> <b>digit</b> <b>lower</b> <b>punct</b> <b>upper</b>                                           |
| 37014     |                         | <b>alpha</b> <b>cntrl</b> <b>graph</b> <b>print</b> <b>space</b> <b>xdigit</b>                                          |
| 37015 XSI |                         | In addition, character class expressions of the form [: <i>name</i> :] shall be recognized in                           |
| 37016     |                         | those locales where the <i>name</i> keyword has been given a <b>charclass</b> definition in the                         |
| 37017     |                         | <i>LC_CTYPE</i> category.                                                                                               |
| 37018     |                         | When both the <b>-d</b> and <b>-s</b> options are specified, any of the character class names                           |
| 37019     |                         | shall be accepted in <i>string2</i> . Otherwise, only character class names <b>lower</b> or <b>upper</b>                |
| 37020     |                         | are valid in <i>string2</i> and then only if the corresponding character class ( <b>upper</b> and                       |
| 37021     |                         | <b>lower</b> , respectively) is specified in the same relative position in <i>string1</i> . Such a                      |
| 37022     |                         | specification shall be interpreted as a request for case conversion. When [: <i>lower</i> :]                            |
| 37023     |                         | appears in <i>string1</i> and [: <i>upper</i> :] appears in <i>string2</i> , the arrays shall contain the               |
| 37024     |                         | characters from the <b>toupper</b> mapping in the <i>LC_CTYPE</i> category of the current                               |
| 37025     |                         | locale. When [: <i>upper</i> :] appears in <i>string1</i> and [: <i>lower</i> :] appears in <i>string2</i> , the arrays |
| 37026     |                         | shall contain the characters from the <b>tolower</b> mapping in the <i>LC_CTYPE</i> category                            |
| 37027     |                         | of the current locale. The first character from each mapping pair shall be in the                                       |
| 37028     |                         | array for <i>string1</i> and the second character from each mapping pair shall be in the                                |
| 37029     |                         | array for <i>string2</i> in the same relative position.                                                                 |
| 37030     |                         | Except for case conversion, the characters specified by a character class expression                                    |
| 37031     |                         | shall be placed in the array in an unspecified order.                                                                   |
| 37032     |                         | If the name specified for <i>class</i> does not define a valid character class in the current                           |
| 37033     |                         | locale, the behavior is undefined.                                                                                      |
| 37034     | [= <i>equiv</i> =]      | Represents all characters or collating elements belonging to the same equivalence                                       |
| 37035     |                         | class as <i>equiv</i> , as defined by the current setting of the <i>LC_COLLATE</i> locale                               |
| 37036     |                         | category. An equivalence class expression shall be allowed only in <i>string1</i> , or in                               |
| 37037     |                         | <i>string2</i> when it is being used by the combined <b>-d</b> and <b>-s</b> options. The characters                    |
| 37038     |                         | belonging to the equivalence class shall be placed in the array in an unspecified                                       |
| 37039     |                         | order.                                                                                                                  |
| 37040     | [ <i>x</i> * <i>n</i> ] | Represents <i>n</i> repeated occurrences of the character <i>x</i> . Because this expression is                         |
| 37041     |                         | used to map multiple characters to one, it is only valid when it occurs in <i>string2</i> . If                          |
| 37042     |                         | <i>n</i> is omitted or is zero, it shall be interpreted as large enough to extend the <i>string2</i> -                  |
| 37043     |                         | based sequence to the length of the <i>string1</i> -based sequence. If <i>n</i> has a leading zero,                     |
| 37044     |                         | it shall be interpreted as an octal value. Otherwise, it shall be interpreted as a                                      |
| 37045     |                         | decimal value.                                                                                                          |
| 37046     |                         | When the <b>-d</b> option is not specified:                                                                             |
| 37047     |                         | • Each input character found in the array specified by <i>string1</i> shall be replaced by the character                |
| 37048     |                         | in the same relative position in the array specified by <i>string2</i> . When the array specified by                    |
| 37049     |                         | <i>string2</i> is shorter than the one specified by <i>string1</i> , the results are unspecified.                       |
| 37050     |                         | • If the <b>-C</b> option is specified, the complements of the characters specified by <i>string1</i> (the set of       |
| 37051     |                         | all characters in the current character set, as defined by the current setting of <i>LC_CTYPE</i> ,                     |
| 37052     |                         | except for those actually specified in the <i>string1</i> operand) shall be placed in the array in                      |
| 37053     |                         | ascending collation sequence, as defined by the current setting of <i>LC_COLLATE</i> .                                  |
| 37054     |                         | • If the <b>-c</b> option is specified, the complement of the values specified by <i>string1</i> shall be placed        |
| 37055     |                         | in the array in ascending order by binary value.                                                                        |

37056 • Because the order in which characters specified by character class expressions or equivalence  
 37057 class expressions is undefined, such expressions should only be used if the intent is to map  
 37058 several characters into one. An exception is case conversion, as described previously.

37059 When the **-d** option is specified:

- 37060 • Input characters found in the array specified by *string1* shall be deleted.
- 37061 • When the **-C** option is specified with **-d**, all characters except those specified by *string1* shall  
 37062 be deleted. The contents of *string2* are ignored, unless the **-s** option is also specified.
- 37063 • When the **-c** option is specified with **-d**, all values except those specified by *string1* shall be  
 37064 deleted. The contents of *string2* shall be ignored, unless the **-s** option is also specified.
- 37065 • The same string cannot be used for both the **-d** and the **-s** option; when both options are  
 37066 specified, both *string1* (used for deletion) and *string2* (used for squeezing) shall be required.

37067 When the **-s** option is specified, after any deletions or translations have taken place, repeated  
 37068 sequences of the same character shall be replaced by one occurrence of the same character, if the  
 37069 character is found in the array specified by the last operand. If the last operand contains a  
 37070 character class, such as the following example:

37071 `tr -s '[:space:]'`

37072 the last operand's array shall contain all of the characters in that character class. However, in a  
 37073 case conversion, as described previously, such as:

37074 `tr -s '[:upper:]' '[:lower:]'`

37075 the last operand's array shall contain only those characters defined as the second characters in  
 37076 each of the **toupper** or **tolower** character pairs, as appropriate.

37077 An empty string used for *string1* or *string2* produces undefined results.

#### 37078 EXIT STATUS

37079 The following exit values shall be returned:

37080     **0**   All input was processed successfully.

37081     **>0**   An error occurred.

#### 37082 CONSEQUENCES OF ERRORS

37083     Default.

#### 37084 APPLICATION USAGE

37085 If necessary, *string1* and *string2* can be quoted to avoid pattern matching by the shell.

37086 If an ordinary digit (representing itself) is to follow an octal sequence, the octal sequence must  
 37087 use the full three digits to avoid ambiguity.

37088 When *string2* is shorter than *string1*, a difference results between historical System V and BSD  
 37089 systems. A BSD system pads *string2* with the last character found in *string2*. Thus, it is possible  
 37090 to do the following:

37091 `tr 0123456789 d`

37092 which would translate all digits to the letter 'd'. Since this area is specifically unspecified in  
 37093 this volume of IEEE Std. 1003.1-200x, both the BSD and System V behaviors are allowed, but a  
 37094 portable application cannot rely on the BSD behavior. It would have to code the example in the  
 37095 following way:

37096 `tr 0123456789 '[d*]'`

37097 It should be noted that, despite similarities in appearance, the string operands used by *tr* are not  
 37098 regular expressions.

37099 Unlike some historical implementations, this definition of the *tr* utility correctly processes NUL  
 37100 characters in its input stream. NUL characters can be stripped by using:

37101 `tr -d '\000'`

### 37102 EXAMPLES

37103 1. The following example creates a list of all words in **file1** one per line in **file2**, where a word  
 37104 is taken to be a maximal string of letters.

37105 `tr -cs "[:alpha:]" "[\n*]" <file1 >file2`

37106 2. The next example translates all lowercase characters in **file1** to uppercase and writes the  
 37107 results to standard output.

37108 `tr "[:lower:]" "[:upper:]" <file1`

37109 Note that the caveat expressed in the corresponding Issue 3 example is no longer in effect.  
 37110 This case conversion is now a special case that employs the **tolower** and **toupper**  
 37111 classifications, ensuring that proper mapping is accomplished (when the locale is correctly  
 37112 defined).

37113 3. This example uses an equivalence class to identify accented variants of the base character  
 37114 'e' in **file1**, which are stripped of diacritical marks and written to **file2**.

37115 `tr "[=e]" e <file1 >file2`

### 37116 RATIONALE

37117 In some early proposals, an explicit option **-n** was added to disable the historical behavior of  
 37118 stripping NUL characters from the input. It was considered that automatically stripping NUL  
 37119 characters from the input was not correct functionality. However, the removal of **-n** in a later  
 37120 proposal does not remove the requirement that *tr* correctly process NUL characters in its input  
 37121 stream. NUL characters can be stripped by using `tr -d '\000'`.

37122 Historical implementations of *tr* differ widely in syntax and behavior. For example, the BSD  
 37123 version has not needed the bracket characters for the repetition sequence. The POSIX Shell and  
 37124 Utilities *tr* syntax is based more closely on the System V and XPG3 model while attempting to  
 37125 accommodate historical BSD implementations. In the case of the short *string2* padding, the  
 37126 decision was to unspecify the behavior and preserve System V and XPG3 scripts, which might  
 37127 find difficulty with the BSD method. The assumption was made that BSD users of *tr* have to  
 37128 make accommodations to meet the POSIX Shell and Utilities syntax. Since it is possible to use  
 37129 the repetition sequence to duplicate the desired behavior, whereas there is no simple way to  
 37130 achieve the System V method, this was the correct, if not desirable, approach.

37131 The use of octal values to specify control characters, while having historical precedents, is not  
 37132 portable. The introduction of escape sequences for control characters should provide the  
 37133 necessary portability. It is recognized that this may cause some historical scripts to break.

37134 An early proposal included support for multi-character collating elements. It was pointed out  
 37135 that, while *tr* does employ some syntactical elements from REs, the aim of *tr* is quite different;  
 37136 ranges, for example, do not have a similar meaning ("any of the chars in the range matches",  
 37137 versus "translate each character in the range to the output counterpart"). As a result, the  
 37138 previously included support for multi-character collating elements has been removed. What  
 37139 remains are ranges in current collation order (to support, for example, accented characters),  
 37140 character classes, and equivalence classes.

37141 In XPG3 the [:class:] and [=equiv=] conventions are shown with double brackets, as in RE syntax.  
 37142 However, *tr* does not implement RE principles; it just borrows part of the syntax. Consequently,  
 37143 [:class:] and [=equiv=] should be regarded as syntactical elements on a par with [x\*n], which is  
 37144 not an RE bracket expression.

37145 The standard developers will consider changes to *tr* that allow it to translate characters between  
 37146 different character encodings, or they will consider providing a new utility to accomplish this.

37147 On historical System V systems, a range expression requires enclosing square-brackets, such as:

37148 `tr '[a-z]' '[A-Z]'`

37149 However, BSD-based systems did not require the brackets, and this convention is used by POSIX  
 37150 Shell and Utilities to avoid breaking large numbers of BSD scripts:

37151 `tr a-z A-Z`

37152 The preceding System V script will continue to work because the brackets, treated as regular  
 37153 characters, are translated to themselves. However, any System V script that relied on *a-z*  
 37154 representing the three characters '-', ' and 'z' have to be rewritten as *az-*.

37155 A prior version of IEEE Std. 1003.1-200x had a *-c* option that behaved similarly to the *-C* option,  
 37156 but did not supply functionality equivalent to the *-c* option specified in IEEE Std. 1003.1-200x.  
 37157 This meant that historical practice of being able to specify *tr -d\200-\377* (which would delete  
 37158 all bytes with the top bit set) would have no effect because, in the C locale, bytes with the values  
 37159 octal 200 to octal 377 are not characters.

37160 The earlier version also said that octal sequences referred to collating elements and could be  
 37161 placed adjacent to each other to specify multi-byte characters. However, it was noted that this  
 37162 caused ambiguities because *tr* would not be able to tell whether adjacent octal sequences were  
 37163 intending to specify multi-byte characters or multiple single byte characters.  
 37164 IEEE Std. 1003.1-200x specifies that octal sequences always refer to single byte binary values.

#### 37165 **FUTURE DIRECTIONS**

37166 None.

#### 37167 **SEE ALSO**

37168 *sed*

#### 37169 **CHANGE HISTORY**

37170 First released in Issue 2.

#### 37171 **Issue 4**

37172 Aligned with the ISO/IEC 9945-2: 1993 standard.

#### 37173 **Issue 6**

37174 The *-C* operand is added, and the description of the *-c* operand is changed to align with the  
 37175 IEEE P1003.2b draft standard.

37176 The normative text is reworded to avoid use of the term “must” for application requirements.

37177 **NAME**

37178           true — return true value

37179 **SYNOPSIS**

37180           true

37181 **DESCRIPTION**

37182           The *true* utility shall return with exit code zero.

37183 **OPTIONS**

37184           None.

37185 **OPERANDS**

37186           None.

37187 **STDIN**

37188           Not used.

37189 **INPUT FILES**

37190           None.

37191 **ENVIRONMENT VARIABLES**

37192           None.

37193 **ASYNCHRONOUS EVENTS**

37194           Default.

37195 **STDOUT**

37196           Not used.

37197 **STDERR**

37198           None.

37199 **OUTPUT FILES**

37200           None.

37201 **EXTENDED DESCRIPTION**

37202           None.

37203 **EXIT STATUS**

37204           Default.

37205 **CONSEQUENCES OF ERRORS**

37206           None.

37207 **APPLICATION USAGE**

37208           This utility is typically used in shell scripts, as shown in the **EXAMPLES** section. The special  
37209           built-in utility `:` is sometimes more efficient than *true*.

37210 **EXAMPLES**

37211           This command is executed forever:

```
37212 while true
37213 do
37214 command
37215 done
```

37216 **RATIONALE**

37217 The *true* utility has been retained in this volume of IEEE Std. 1003.1-200x, even though the shell  
37218 special built-in : provides similar functionality, because *true* is widely used in historical scripts  
37219 and is less cryptic to novice script readers.

37220 **FUTURE DIRECTIONS**

37221 None.

37222 **SEE ALSO**

37223 *false*, Section 2.9 on page 67

37224 **CHANGE HISTORY**

37225 First released in Issue 2.

37226 **Issue 4**

37227 Aligned with the ISO/IEC 9945-2:1993 standard.

37228 **NAME**

37229           tsort — topological sort

37230 **SYNOPSIS**37231 XSI       tsort [*file*]

37232

37233 **DESCRIPTION**37234           The *tsort* utility shall write to standard output a totally ordered list of items consistent with a  
37235           partial ordering of items contained in the input.37236           The application shall ensure that the input consists of pairs of items (non-empty strings) |  
37237           separated by <blank>s. Pairs of different items indicate ordering. Pairs of identical items |  
37238           indicate presence, but not ordering.37239 **OPTIONS**

37240           None.

37241 **OPERANDS**

37242           The following operand shall be supported:

37243           *file*           A path name of a text file to order. If no *file* operand is given, the standard input is  
37244           used.37245 **STDIN**37246           The standard input shall be a text file that is used if no *file* operand is given. |37247 **INPUT FILES**37248           The input file named by the *file* operand is a text file.37249 **ENVIRONMENT VARIABLES**37250           The following environment variables shall affect the execution of *tsort*:37251           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
37252                           If *LANG* is unset or null, the corresponding value from the implementation-  
37253                           dependent default locale shall be used. If any of the internationalization variables  
37254                           contains an invalid setting, the utility shall behave as if none of the variables had  
37255                           been defined.37256           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
37257           internationalization variables.37258           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
37259           characters (for example, single-byte as opposed to multi-byte characters in  
37260           arguments and input files).37261           *LC\_MESSAGES*                           Determine the locale that should be used to affect the format and contents of  
37262           diagnostic messages written to standard error.  
3726337264           *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.37265 **ASYNCHRONOUS EVENTS**

37266           Default.

37267 **STDOUT**37268           The standard output shall be a text file consisting of the order list produced from the partially  
37269           ordered input.

**37270 STDERR**

37271           Used only for diagnostic messages.

**37272 OUTPUT FILES**

37273           None.

**37274 EXTENDED DESCRIPTION**

37275           None.

**37276 EXIT STATUS**

37277           The following exit values shall be returned:

37278           0   Successful completion.

37279           >0  An error occurred.

**37280 CONSEQUENCES OF ERRORS**

37281           Default.

**37282 APPLICATION USAGE**

37283           The *LC\_COLLATE* variable need not affect the actions of *tsort*. The output ordering is not  
37284           lexicographic, but depends on the pairs of items given as input.

**37285 EXAMPLES**

37286           The command:

37287           *tsort* <<EOF

37288           a b c c d e

37289           g g

37290           f g e f

37291           h h

37292           EOF

37293           produces the output:

37294           **a**

37295           **b**

37296           **c**

37297           **d**

37298           **e**

37299           **f**

37300           **g**

37301           **h**

**37302 RATIONALE**

37303           None.

**37304 FUTURE DIRECTIONS**

37305           None.

**37306 SEE ALSO**

37307           None.

**37308 CHANGE HISTORY**

37309           First released in Issue 2.

**37310 Issue 4**

37311           Format reorganized.

37312           Internationalized environment variable support mandated.

37313 **Issue 6**

37314 The normative text is reworded to avoid use of the term “must” for application requirements.

37315 **NAME**

37316           tty — return user's terminal name

37317 **SYNOPSIS**

37318           tty

37319 **DESCRIPTION**

37320           The *tty* utility shall write to the standard output the name of the terminal that is open as  
 37321           standard input. The name that is used shall be equivalent to the string that would be returned by  
 37322           the *ttyname()* function defined in the System Interfaces volume of IEEE Std. 1003.1-200x.

37323 **OPTIONS**

37324           The *tty* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 37325           Section 12.2, Utility Syntax Guidelines.

37326 **OPERANDS**

37327           None.

37328 **STDIN**

37329           While no input is read from standard input, standard input shall be examined to determine  
 37330           whether or not it is a terminal, and, if so, to determine the name of the terminal.

37331 **INPUT FILES**

37332           None.

37333 **ENVIRONMENT VARIABLES**37334           The following environment variables shall affect the execution of *tty*:

37335           *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 37336                       If *LANG* is unset or null, the corresponding value from the implementation-  
 37337                       dependent default locale shall be used. If any of the internationalization variables  
 37338                       contains an invalid setting, the utility shall behave as if none of the variables had  
 37339                       been defined.

37340           *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 37341                       internationalization variables.

37342           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 37343                       characters (for example, single-byte as opposed to multi-byte characters in  
 37344                       arguments).

37345           *LC\_MESSAGES*

37346                       Determine the locale that should be used to affect the format and contents of  
 37347                       diagnostic messages written to standard error and informative messages written to  
 37348                       standard output.

37349 XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

37350 **ASYNCHRONOUS EVENTS**

37351           Default.

37352 **STDOUT**

37353           If the *-s* option is not specified and standard input is a terminal device, a path name of the  
 37354           terminal as specified by the *ttyname()* function defined in the System Interfaces volume of  
 37355           IEEE Std. 1003.1-200x shall be written in the following format:

37356           "%s\n", &lt;terminal name&gt;

37357           Otherwise, a message shall be written indicating that standard input is not connected to a  
 37358           terminal. In the POSIX locale, the *tty* utility shall use the format:

37359 "not a tty\n"

37360 **STDERR**

37361 Used only for diagnostic messages.

37362 **OUTPUT FILES**

37363 None.

37364 **EXTENDED DESCRIPTION**

37365 None.

37366 **EXIT STATUS**

37367 The following exit values shall be returned:

37368 0 Standard input is a terminal.

37369 1 Standard input is not a terminal.

37370 >1 An error occurred.

37371 **CONSEQUENCES OF ERRORS**

37372 Default.

37373 **APPLICATION USAGE**

37374 This utility checks the status of the file open as standard input against that of a system-defined  
37375 set of files. It is possible that no match can be found, or that the match found need not be the  
37376 same file as that which was opened for standard input (although they are the same device).

37377 The **-s** option is useful only if the exit code is wanted. It does not rely on the ability to form a  
37378 valid path name. Portable applications should use *test -t 0*.

37379 **EXAMPLES**

37380 None.

37381 **RATIONALE**

37382 None.

37383 **FUTURE DIRECTIONS**

37384 None.

37385 **SEE ALSO**

37386 The System Interfaces volume of IEEE Std. 1003.1-200x, *isatty()*, *ttyname()*

37387 **CHANGE HISTORY**

37388 First released in Issue 2.

37389 **Issue 4**

37390 Aligned with the ISO/IEC 9945-2: 1993 standard.

37391 **Issue 5**

37392 The SYNOPSIS is changed to indicate two forms of the command, with the second form marked  
37393 as obsolete. This is a clarification and does not change the functionality published in previous  
37394 issues.

37395 **NAME**37396           *type* — write a description of command *type*37397 **SYNOPSIS**37398 xsi       *type name...*

37399

37400 **DESCRIPTION**37401       The *type* utility shall indicate how each argument would be interpreted if used as a command  
37402       name.37403 **OPTIONS**

37404       None.

37405 **OPERANDS**

37406       The following operand shall be supported:

37407       *name*           A name to be interpreted.37408 **STDIN**

37409       Not used.

37410 **INPUT FILES**

37411       None.

37412 **ENVIRONMENT VARIABLES**37413       The following environment variables shall affect the execution of *type*:37414       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
37415                       If *LANG* is unset or null, the corresponding value from the implementation-  
37416                       dependent default locale shall be used. If any of the internationalization variables  
37417                       contains an invalid setting, the utility shall behave as if none of the variables had  
37418                       been defined.37419       *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
37420                       internationalization variables.37421       *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
37422                       characters (for example, single-byte as opposed to multi-byte characters in  
37423                       arguments).37424       *LC\_MESSAGES*   Determine the locale that should be used to affect the format and contents of  
37425                       diagnostic messages written to standard error.  
3742637427       *NLSPATH*       Determine the location of message catalogs for the processing of *LC\_MESSAGES*.37428       *PATH*           Determine the location of *name*, as described in the System Interface Definitions  
37429                       volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables.37430 **ASYNCHRONOUS EVENTS**

37431       Default.

37432 **STDOUT**37433       The standard output of *type* contains information about each operand in an unspecified format.  
37434       The information provided typically identifies the operand as a shell built-in, function, alias, or  
37435       keyword, and where applicable, may display the operand's path name.

37436 **STDERR**

37437           Used only for diagnostic messages.

37438 **OUTPUT FILES**

37439           None.

37440 **EXTENDED DESCRIPTION**

37441           None.

37442 **EXIT STATUS**

37443           The following exit values shall be returned:

37444           0   Successful completion.

37445           >0  An error occurred.

37446 **CONSEQUENCES OF ERRORS**

37447           Default.

37448 **APPLICATION USAGE**

37449           Since *type* must be aware of the contents of the current shell execution environment (such as the  
37450           lists of commands, functions, and built-ins processed by *hash*), it is always provided as a shell  
37451           regular built-in. If it is called in a separate utility execution environment, such as one of the  
37452           following:

37453           nohup type writer

37454           find . -type f | xargs type

37455           it might not produce accurate results.

37456 **EXAMPLES**

37457           None.

37458 **RATIONALE**

37459           None.

37460 **FUTURE DIRECTIONS**

37461           None.

37462 **SEE ALSO**

37463           *command*

37464 **CHANGE HISTORY**

37465           First released in Issue 2.

37466 **Issue 4**

37467           Relocated from the *sh* description to reflect its status as a regular built-in utility.

37468 **NAME**

37469           ulimit — set or report file size limit

37470 **SYNOPSIS**37471 xSI       ulimit [-f][*blocks*]

37472

37473 **DESCRIPTION**

37474       The *ulimit* utility shall set or report the file-size writing limit imposed on files written by the  
 37475 shell and its child processes (files of any size may be read). Only a process with appropriate  
 37476 privileges can increase the limit.

37477 **OPTIONS**

37478       The *ulimit* utility shall conform to the System Interface Definitions volume of  
 37479 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

37480       The following option shall be supported:

37481       -f           Set (or report, if no *blocks* operand is present), the file size limit in blocks. The -f  
 37482 option shall also be the default case.

37483 **OPERANDS**

37484       The following operand shall be supported:

37485       *blocks*       The number of 512-byte blocks to use as the new file size limit.

37486 **STDIN**

37487       Not used.

37488 **INPUT FILES**

37489       None.

37490 **ENVIRONMENT VARIABLES**

37491       The following environment variables shall affect the execution of *ulimit*:

37492       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 37493 If *LANG* is unset or null, the corresponding value from the implementation-  
 37494 dependent default locale shall be used. If any of the internationalization variables  
 37495 contains an invalid setting, the utility shall behave as if none of the variables had  
 37496 been defined.

37497       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 37498 internationalization variables.

37499       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 37500 characters (for example, single-byte as opposed to multi-byte characters in  
 37501 arguments).

37502       *LC\_MESSAGES*

37503                   Determine the locale that should be used to affect the format and contents of  
 37504 diagnostic messages written to standard error.

37505       *NLSPATH*    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

37506 **ASYNCHRONOUS EVENTS**

37507       Default.

**37508 STDOUT**

37509       The standard output shall be used when no *blocks* operand is present. If the current number of  
37510       blocks is limited, the number of blocks in the current limit shall be written in the following  
37511       format:

37512       "%d\n", <number of 512-byte blocks>

37513       If there is no current limit on the number of blocks, in the POSIX locale the following format  
37514       shall be used:

37515       "unlimited\n"

**37516 STDERR**

37517       Used only for diagnostic messages.

**37518 OUTPUT FILES**

37519       None.

**37520 EXTENDED DESCRIPTION**

37521       None.

**37522 EXIT STATUS**

37523       The following exit values shall be returned:

37524       0   Successful completion.

37525       >0  A request for a higher limit was rejected or an error occurred.

**37526 CONSEQUENCES OF ERRORS**

37527       Default.

**37528 APPLICATION USAGE**

37529       Since *ulimit* affects the current shell execution environment, it is always provided as a shell  
37530       regular built-in. If it is called in separate utility execution environment, such as one of the  
37531       following:

37532       nohup ulimit -f 10000

37533       env ulimit 10000

37534       it does not affect the file size limit of the caller's environment.

37535       Once a limit has been decreased by a process, it cannot be increased (unless appropriate  
37536       privileges are involved), even back to the original system limit.

**37537 EXAMPLES**

37538       Set the file size limit to 51 200 bytes:

37539       ulimit -f 100

**37540 RATIONALE**

37541       None.

**37542 FUTURE DIRECTIONS**

37543       None.

**37544 SEE ALSO**

37545       The System Interfaces volume of IEEE Std. 1003.1-200x, *ulimit()*

**37546 CHANGE HISTORY**

37547       First released in Issue 2.

37548 **Issue 4**

37549 Relocated from the *sh* description to reflect its status as a regular built-in utility.

37550 **NAME**

37551           umask — get or set the file mode creation mask

37552 **SYNOPSIS**37553           umask [-S][*mask*]37554 **DESCRIPTION**

37555           The *umask* utility shall set the file mode creation mask of the current shell execution  
 37556           environment (see Section 2.12 on page 90) to the value specified by the *mask* operand. This mask  
 37557           shall affect the initial value of the file permission bits of subsequently created files. If *umask* is  
 37558           called in a subshell or separate utility execution environment, such as one of the following:

37559           (*umask* 002)37560           nohup *umask* ...37561           find . -exec *umask* ... \;

37562           it shall not affect the file mode creation mask of the caller's environment.

37563           If the *mask* operand is not specified, the *umask* utility shall write to standard output the value of  
 37564           the invoking process's file mode creation mask.

37565 **OPTIONS**

37566           The *umask* utility shall conform to the System Interface Definitions volume of  
 37567           IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

37568           The following option shall be supported:

37569           -S           Produce symbolic output.

37570           The default output style is unspecified, but shall be recognized on a subsequent invocation of  
 37571           *umask* on the same system as a *mask* operand to restore the previous file mode creation mask.

37572 **OPERANDS**

37573           The following operand shall be supported:

37574           *mask*           A string specifying the new file mode creation mask. The string is treated in the  
 37575           same way as the *mode* operand described in the the EXTENDED DESCRIPTION  
 37576           section for *chmod*.

37577           For a *symbolic\_mode* value, the new value of the file mode creation mask shall be  
 37578           the logical complement of the file permission bits portion of the file mode specified  
 37579           by the *symbolic\_mode* string.

37580           In a *symbolic\_mode* value, the permissions *op* characters '+' and '-' shall be  
 37581           interpreted relative to the current file mode creation mask; '+' shall cause the bits  
 37582           for the indicated permissions to be cleared in the mask; '-' shall cause the bits for  
 37583           the indicated permissions to be set in the mask.

37584           The interpretation of *mode* values that specify file mode bits other than the file  
 37585           permission bits is unspecified.

37586           MAN           In the octal integer form of *mode*, the specified bits are set in the file mode creation  
 37587           mask.

37588           The file mode creation mask shall be set to the resulting numeric value.

37589           The default output of a prior invocation of *umask* on the same system with no  
 37590           operand also shall be recognized as a *mask* operand. The use of an operand  
 37591           obtained in this way is not obsolescent, even if it is an octal number.

37592 **STDIN**

37593 Not used.

37594 **INPUT FILES**

37595 None.

37596 **ENVIRONMENT VARIABLES**37597 The following environment variables shall affect the execution of *umask*:

37598 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 37599 If *LANG* is unset or null, the corresponding value from the implementation-  
 37600 dependent default locale shall be used. If any of the internationalization variables  
 37601 contains an invalid setting, the utility shall behave as if none of the variables had  
 37602 been defined.

37603 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 37604 internationalization variables.

37605 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 37606 characters (for example, single-byte as opposed to multi-byte characters in  
 37607 arguments).

37608 *LC\_MESSAGES*

37609 Determine the locale that should be used to affect the format and contents of  
 37610 diagnostic messages written to standard error.

37611 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

37612 **ASYNCHRONOUS EVENTS**

37613 Default.

37614 **STDOUT**

37615 When the *mask* operand is not specified, the *umask* utility shall write a message to standard  
 37616 output that can later be used as a *umask mask* operand.

37617 If *-S* is specified, the message shall be in the following format:

37618 "u=%s,g=%s,o=%s\n", <owner permissions>, <group permissions>,  
 37619 <other permissions>

37620 where the three values shall be combinations of letters from the set {r, w, x}; the presence of a  
 37621 letter shall indicate that the corresponding bit is clear in the file mode creation mask.

37622 If a *mask* operand is specified, there shall be no output written to standard output.37623 **STDERR**

37624 Used only for diagnostic messages.

37625 **OUTPUT FILES**

37626 None.

37627 **EXTENDED DESCRIPTION**

37628 None.

37629 **EXIT STATUS**

37630 The following exit values shall be returned:

37631 0 The file mode creation mask was successfully changed, or no *mask* operand was supplied.

37632 &gt;0 An error occurred.

## 37633 CONSEQUENCES OF ERRORS

37634 Default.

## 37635 APPLICATION USAGE

37636 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
 37637 regular built-in.

37638 In contrast to the negative permission logic provided by the file mode creation mask and the  
 37639 octal number form of the *mask* argument, the symbolic form of the *mask* argument specifies those  
 37640 permissions that are left alone.

## 37641 EXAMPLES

37642 Either of the commands:

37643 `umask a=rx,ug+w`37644 `umask 002`

37645 sets the mode mask so that subsequently created files have their S\_IWOTH bit cleared.

37646 After setting the mode mask with either of the above commands, the *umask* command can be  
 37647 used to write out the current value of the mode mask:

37648 `$ umask`37649 `0002`

37650 (The output format is unspecified, but historical implementations use the obsolescent octal  
 37651 integer mode format.)

37652 `$ umask -S`37653 `u=rwx,g=rwx,o=rx`

37654 Either of these outputs can be used as the mask operand to a subsequent invocation of the *umask*  
 37655 utility.

37656 Assuming the mode mask is set as above, the command:

37657 `umask g-w`

37658 sets the mode mask so that subsequently created files have their S\_IWGRP and S\_IWOTH bits  
 37659 cleared.

37660 The command:

37661 `umask -- -w`

37662 sets the mode mask so that subsequently created files have all their write bits cleared. Note that  
 37663 *mask* operands `-r`, `-w`, `-x` or anything beginning with a hyphen, must be preceded by `--` to  
 37664 keep it from being interpreted as an option.

## 37665 RATIONALE

37666 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
 37667 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
 37668 of the following:

37669 `(umask 002)`37670 `nohup umask ...`37671 `find . -exec umask ... \;`

37672 it does not affect the file mode creation mask of the environment of the caller.

37673 The description of the historical utility was modified to allow it to use the symbolic modes of  
 37674 *chmod*. The `-s` option used in early proposals was changed to `-S` because `-s` could be confused

37675 with a *symbolic\_mode* form of mask referring to the S\_ISUID and S\_ISGID bits.

37676 **Notes to Reviewers**

37677 *This section with side shading will not appear in the final copy. - Ed.*

37678 D1, XCU, ERN 355 suggests we should specify the default output. Suggestions please.

37679 The default output style is implementation-dependent to permit implementors to provide  
37680 migration to the new symbolic style at the time most appropriate to their users. An **-o** flag to  
37681 force octal mode output was omitted because the octal mode may not be sufficient to specify all  
37682 of the information that may be present in the file mode creation mask when more secure file  
37683 access permission checks are implemented.

37684 It has been suggested that trusted systems developers might appreciate ameliorating the  
37685 requirement that the mode mask “affects” the file access permissions, since it seems access  
37686 control lists might replace the mode mask to some degree. The wording has been changed to say  
37687 that it affects the file permission bits, and it leaves the details of the behavior of how they affect  
37688 the file access permissions to the description in the System Interfaces volume of  
37689 IEEE Std. 1003.1-200x.

37690 **FUTURE DIRECTIONS**

37691 None.

37692 **SEE ALSO**

37693 *chmod*, the System Interfaces volume of IEEE Std. 1003.1-200x, *umask()*

37694 **CHANGE HISTORY**

37695 First released in Issue 2.

37696 **Issue 4**

37697 Aligned with the ISO/IEC 9945-2:1993 standard.

37698 **Issue 6**

37699 The following new requirements on POSIX implementations derive from alignment with the  
37700 Single UNIX Specification:

- 37701
- The octal mode is supported.

37702 **NAME**

37703 unalias — remove alias definitions

37704 **SYNOPSIS**37705 UP unalias *alias-name*...

37706 unalias -a

37707

37708 **DESCRIPTION**

37709 The *unalias* utility shall remove the definition for each alias name specified. See Section 2.3.1 on  
 37710 page 40. The aliases shall be removed from the current shell execution environment; see Section  
 37711 2.12 on page 90.

37712 **OPTIONS**

37713 The *unalias* utility shall conform to the System Interface Definitions volume of  
 37714 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

37715 The following option shall be supported:

37716 **-a** Remove all alias definitions from the current shell execution environment.

37717 **OPERANDS**

37718 The following operand shall be supported:

37719 *alias-name* The name of an alias to be removed.

37720 **STDIN**

37721 Not used.

37722 **INPUT FILES**

37723 None.

37724 **ENVIRONMENT VARIABLES**

37725 The following environment variables shall affect the execution of *unalias*:

37726 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 37727 If *LANG* is unset or null, the corresponding value from the implementation-  
 37728 dependent default locale shall be used. If any of the internationalization variables  
 37729 contains an invalid setting, the utility shall behave as if none of the variables had  
 37730 been defined.

37731 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 37732 internationalization variables.

37733 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 37734 characters (for example, single-byte as opposed to multi-byte characters in  
 37735 arguments).

37736 **LC\_MESSAGES**

37737 Determine the locale that should be used to affect the format and contents of  
 37738 diagnostic messages written to standard error.

37739 **XS1** **NLS\_PATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

37740 **ASYNCHRONOUS EVENTS**

37741 Default.

37742 **STDOUT**

37743 Not used.

37744 **STDERR**

37745 Used only for diagnostic messages.

37746 **OUTPUT FILES**

37747 None.

37748 **EXTENDED DESCRIPTION**

37749 None.

37750 **EXIT STATUS**

37751 The following exit values shall be returned:

37752 0 Successful completion.

37753 >0 One of the *alias-name* operands specified did not represent a valid alias definition, or an  
37754 error occurred.37755 **CONSEQUENCES OF ERRORS**

37756 Default.

37757 **APPLICATION USAGE**37758 Since *unalias* affects the current shell execution environment, it is generally provided as a shell  
37759 regular built-in.37760 Application writers should note that this utility need not be provided on systems that do not  
37761 support the User Portability Utilities option.37762 **EXAMPLES**

37763 None.

37764 **RATIONALE**37765 The *unalias* description is based on that from historical KornShell implementations. Known  
37766 differences exist between that and the C shell. The KornShell version was adopted to be  
37767 consistent with all the other KornShell features in this volume of IEEE Std. 1003.1-200x, such as  
37768 command line editing.37769 The *-a* option is the equivalent of the *unalias\** form of the C shell and is provided to address  
37770 security concerns about unknown aliases entering the environment of a user (or application)  
37771 through the allowable implementation-dependent predefined alias route or as a result of an *ENV*  
37772 file. (Although *unalias* could be used to simplify the “secure” shell script shown in the *command*  
37773 rationale, it does not obviate the need to quote all command names. An initial call to *unalias -a*  
37774 would have to be quoted in case there was an alias for *unalias*.)37775 **FUTURE DIRECTIONS**

37776 None.

37777 **SEE ALSO**37778 *alias*37779 **CHANGE HISTORY**

37780 First released in Issue 4.

37781 **Issue 6**

37782 This utility is now marked as part of the User Portability Utilities option.

37783 **NAME**37784            *uname* — return system name37785 **SYNOPSIS**37786            *uname* [*-snrvma*]37787 **DESCRIPTION**

37788            By default, the *uname* utility shall write the operating system name to standard output. When  
 37789            options are specified, symbols representing one or more system characteristics shall be written  
 37790            to the standard output. The format and contents of the symbols are implementation-dependent.  
 37791            On systems conforming to the System Interfaces volume of IEEE Std. 1003.1-200x, the symbols  
 37792            written shall be those supported by the *uname()* function as defined in the System Interfaces  
 37793            volume of IEEE Std. 1003.1-200x.

37794 **OPTIONS**

37795            The *uname* utility shall conform to the System Interface Definitions volume of  
 37796            IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

37797            The following options shall be supported:

- 37798            **-a**            Behave as though all of the options **-mnrsv** were specified.
- 37799            **-m**            Write the name of the hardware type on which the system is running to standard  
 37800            output.
- 37801            **-n**            Write the name of this node within an implementation-dependent  
 37802            communications network.
- 37803            **-r**            Write the current release level of the operating system implementation.
- 37804            **-s**            Write the name of the implementation of the operating system.
- 37805            **-v**            Write the current version level of this release of the operating system  
 37806            implementation.
- 37807            If no options are specified, the *uname* utility shall write the operating system name, as if the **-s**  
 37808            option had been specified.

37809 **OPERANDS**

37810            None.

37811 **STDIN**

37812            Not used.

37813 **INPUT FILES**

37814            None.

37815 **ENVIRONMENT VARIABLES**37816            The following environment variables shall affect the execution of *uname*:

- 37817            **LANG**        Provide a default value for the internationalization variables that are unset or null.  
 37818            If **LANG** is unset or null, the corresponding value from the implementation-  
 37819            dependent default locale shall be used. If any of the internationalization variables  
 37820            contains an invalid setting, the utility shall behave as if none of the variables had  
 37821            been defined.
- 37822            **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
 37823            internationalization variables.
- 37824            **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as  
 37825            characters (for example, single-byte as opposed to multi-byte characters in

arguments).

**LC\_MESSAGES**  
Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

**ASYNCHRONOUS EVENTS**  
Default.

**STDOUT**  
By default, the output shall be a single line of the following form:  
"%s\n", <sysname>  
If the **-a** option is specified, the output shall be a single line of the following form:  
"%s %s %s %s %s\n", <sysname>, <nodename>, <release>, <version>, <machine>  
Additional implementation-dependent symbols may be written; all such symbols shall be written at the end of the line of output before the <newline> character.  
If options are specified to select different combinations of the symbols, only those symbols shall be written, in the order shown above for the **-a** option. If a symbol is not selected for writing, its corresponding trailing <blank> characters also shall not be written.

**STDERR**  
Used only for diagnostic messages.

**OUTPUT FILES**  
None.

**EXTENDED DESCRIPTION**  
None.

**EXIT STATUS**  
The following exit values shall be returned:  
0 The requested information was successfully written.  
>0 An error occurred.

**CONSEQUENCES OF ERRORS**  
Default.

**APPLICATION USAGE**  
Note that any of the symbols could include embedded <space> characters, which may affect parsing algorithms if multiple options are selected for output.  
The node name is typically a name that the system uses to identify itself for intersystem communication addressing.

**EXAMPLES**  
The following command:  
uname -sr  
writes the operating system name and release level, separated by one or more <blank> characters.

**37866 RATIONALE**

37867 It was suggested that this utility cannot be used portably since the format of the symbols is  
37868 implementation-dependent. The POSIX.1 working group could not achieve consensus on  
37869 defining these formats in the underlying *uname()* function, and there was no expectation that  
37870 this volume of IEEE Std. 1003.1-200x would be any more successful. Some applications may still  
37871 find this historical utility of value. For example, the symbols could be used for system log entries  
37872 or for comparison with operator or user input.

**37873 FUTURE DIRECTIONS**

37874 None.

**37875 SEE ALSO**

37876 The System Interfaces volume of IEEE Std. 1003.1-200x, *uname()*

**37877 CHANGE HISTORY**

37878 First released in Issue 2.

**37879 Issue 4**

37880 Aligned with the ISO/IEC 9945-2:1993 standard.

**37881 Issue 4, Version 2**

37882 The SYNOPSIS section lists all the valid options.

37883 **NAME**

37884 uncompress — expand compressed data

37885 **SYNOPSIS**37886 xSI uncompress [-cfv][*file...*]

37887

37888 **DESCRIPTION**

37889 The *uncompress* utility shall restore files to their original state after they have been compressed  
 37890 using the *compress* utility. If no files are specified, the standard input shall be uncompressed to  
 37891 the standard output. If the invoking process has appropriate privileges, the ownership, modes,  
 37892 access time, and modification time of the original file shall be preserved.

37893 This utility shall support the uncompressing of any files produced by the *compress* utility on the  
 37894 same implementation. For files produced by *compress* on other systems, *uncompress* supports 9 to  
 37895 14-bit compression (see *compress* on page 299, -b); it is implementation-dependent whether  
 37896 values of -b greater than 14 are supported.

37897 **OPTIONS**

37898 The *uncompress* utility shall conform to the System Interface Definitions volume of  
 37899 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

37900 The following options shall be supported:

- 37901 -c Write to standard output; no files are changed.
- 37902 -f Do not prompt for overwriting files. Except when run in the background, if -f is  
 37903 not given the user shall be prompted as to whether an existing file should be  
 37904 overwritten. If the standard input is not a terminal and -f is not given, *uncompress*  
 37905 shall write a diagnostic message to standard error and exit with a status greater  
 37906 than zero.
- 37907 -v Write messages to standard error concerning the expansion of each file.

37908 **OPERANDS**

37909 The following operand shall be supported:

- 37910 *file* A path name of a file. If *file* already has the .Z suffix specified, it shall be used as  
 37911 the input file and the output file shall be named *file* with the .Z suffix removed.  
 37912 Otherwise, *file* shall be used as the name of the output file and *file* with the .Z  
 37913 suffix appended shall be used as the input file.

37914 **STDIN**

37915 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '- '.

37916 **INPUT FILES**

37917 Input files shall be in the format produced by the *compress* utility.

37918 **ENVIRONMENT VARIABLES**

37919 The following environment variables shall affect the execution of *uncompress*:

- 37920 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 37921 If *LANG* is unset or null, the corresponding value from the implementation-  
 37922 dependent default locale shall be used. If any of the internationalization variables  
 37923 contains an invalid setting, the utility shall behave as if none of the variables had  
 37924 been defined.
- 37925 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 37926 internationalization variables.

- 37927        *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
37928                   characters (for example, single-byte as opposed to multi-byte characters in  
37929                   arguments).
- 37930        *LC\_MESSAGES*  
37931                   Determine the locale that should be used to affect the format and contents of  
37932                   diagnostic messages written to standard error.
- 37933        *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 37934 **ASYNCHRONOUS EVENTS**  
37935        Default.
- 37936 **STDOUT**  
37937        When there are no file operands or the *-c* option is specified, the uncompressed output is  
37938        written to standard output.
- 37939 **STDERR**  
37940        Prompts shall be written to the standard error output under the conditions specified in the  
37941        DESCRIPTION and OPTIONS sections. The prompts shall contain the *file* path name, but their  
37942        format is otherwise unspecified. Otherwise, the standard error output shall be used only for  
37943        diagnostic messages.
- 37944 **OUTPUT FILES**  
37945        Output files are the same as the respective input files to *compress*.
- 37946 **EXTENDED DESCRIPTION**  
37947        None.
- 37948 **EXIT STATUS**  
37949        The following exit values shall be returned:  
37950        0   Successful completion.  
37951        >0   An error occurred.
- 37952 **CONSEQUENCES OF ERRORS**  
37953        The input file remains unmodified.
- 37954 **APPLICATION USAGE**  
37955        The limit of 14 on the *compress -b bits* argument is to achieve portability to all systems (within  
37956        the restrictions imposed by the lack of an explicit published file format). Some systems based on  
37957        16-bit architectures cannot support 15 or 16-bit uncompression.
- 37958 **EXAMPLES**  
37959        None.
- 37960 **RATIONALE**  
37961        None.
- 37962 **FUTURE DIRECTIONS**  
37963        None.
- 37964 **SEE ALSO**  
37965        *compress*, *zcat*
- 37966 **CHANGE HISTORY**  
37967        First released in Issue 4.

37968 **Issue 4, Version 2**

37969       The DESCRIPTION is clarified to state that the ownership, modes, access time, and modification  
37970       time of the original file are preserved if the invoking process has appropriate privileges.

37971 **Issue 6**

37972       The normative text is reworded to avoid use of the term “must” for application requirements.

37973 **NAME**

37974 unexpand — convert spaces to tabs

37975 **SYNOPSIS**37976 UP unexpand [ -a | -t *tablist* ][*file...*]

37977

37978 **DESCRIPTION**

37979 The *unexpand* utility shall copy files or standard input to standard output, converting <blank>  
 37980 characters at the beginning of each line into the maximum number of <tab> characters followed  
 37981 by the minimum number of <space> characters needed to fill the same column positions  
 37982 originally filled by the translated <blank> characters. By default, tabstops shall be set at every  
 37983 eighth column position. Each <backspace> character shall be copied to the output, and shall  
 37984 cause the column position count for tab calculations to be decremented; the count shall never be  
 37985 decremented to a value less than one.

37986 **OPTIONS**

37987 The *unexpand* utility shall conform to the System Interface Definitions volume of  
 37988 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

37989 The following options shall be supported:

37990 **-a** In addition to translating <blank> characters at the beginning of each line, translate  
 37991 all sequences of two or more <blank> characters immediately preceding a tab stop  
 37992 to the maximum number of <tab> characters followed by the minimum number of  
 37993 <space> characters needed to fill the same column positions originally filled by the  
 37994 translated <blank> characters.

37995 **-t *tablist*** Specify the tab stops. The application shall ensure that the *tablist* option-argument  
 37996 is a single argument consisting of a single positive decimal integer or multiple  
 37997 positive decimal integers, separated by <blank> characters or commas, in  
 37998 ascending order. If a single number is given, tabs shall be set *tablist* column  
 37999 positions apart instead of the default 8. If multiple numbers are given, the tabs  
 38000 shall be set at those specific column positions.

38001 The application shall ensure that each tab-stop position *N* is an integer value  
 38002 greater than zero, and the list shall be in strictly ascending order. This is taken to  
 38003 mean that, from the start of a line of output, tabbing to position *N* shall cause the  
 38004 next character output to be in the (*N*+1)th column position on that line. When the  
 38005 **-t** option is not specified, the default shall be the equivalent of specifying **-t 8**  
 38006 (except for the interaction with **-a**, described below).

38007 No <space>-to-<tab> character conversions shall occur for characters at positions  
 38008 beyond the last of those specified in a multiple tab-stop list.

38009 When **-t** is specified, the presence or absence of the **-a** option shall be ignored;  
 38010 conversion shall not be limited to the processing of leading <blank> characters.

38011 **OPERANDS**

38012 The following operand shall be supported:

38013 ***file*** A path name of a text file to be used as input.

38014 **STDIN**

38015 See the INPUT FILES section.

38016 **INPUT FILES**

38017       The input files shall be text files.

38018 **ENVIRONMENT VARIABLES**38019       The following environment variables shall affect the execution of *unexpand*:

38020       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 38021                   If *LANG* is unset or null, the corresponding value from the implementation-  
 38022                   dependent default locale shall be used. If any of the internationalization variables  
 38023                   contains an invalid setting, the utility shall behave as if none of the variables had  
 38024                   been defined.

38025       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 38026                   internationalization variables.

38027       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 38028                   characters (for example, single-byte as opposed to multi-byte characters in  
 38029                   arguments and input files), the processing of <tab> and <space> characters and for  
 38030                   the determination of the width in column positions each character would occupy  
 38031                   on an output device.

38032       **LC\_MESSAGES**

38033                   Determine the locale that should be used to affect the format and contents of  
 38034                   diagnostic messages written to standard error.

38035 **XSI**       **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

38036 **ASYNCHRONOUS EVENTS**

38037       Default.

38038 **STDOUT**

38039       The standard output is equivalent to the input files with the specified <space>-to-<tab>  
 38040       character conversions.

38041 **STDERR**

38042       Used only for diagnostic messages.

38043 **OUTPUT FILES**

38044       None.

38045 **EXTENDED DESCRIPTION**

38046       None.

38047 **EXIT STATUS**

38048       The following exit values shall be returned:

38049       0   Successful completion.

38050       &gt;0   An error occurred.

38051 **CONSEQUENCES OF ERRORS**

38052       Default.

**38053 APPLICATION USAGE**

38054 One non-intuitive aspect of *unexpand* is its restriction to leading spaces when neither **-a** nor **-t** is  
38055 specified. Users who desire to always convert all spaces in a file can easily alias *unexpand* to use  
38056 the **-a** or **-t 8** option.

38057 Application writers should note that this utility need not be provided on systems that do not  
38058 support the User Portability Utilities option.

**38059 EXAMPLES**

38060 None.

**38061 RATIONALE**

38062 On several occasions, consideration was given to adding a **-t** option to the *unexpand* utility to  
38063 complement the **-t** in *expand* (see *expand* on page 460). The historical intent of *unexpand* was to  
38064 translate multiple <blank>s into tab stops, where tab stops were a multiple of eight column  
38065 positions on most UNIX systems. An early proposal omitted **-t** because it seemed outside the  
38066 scope of the UPE; it was not described in any of the base documents. However, hard-coding tab  
38067 stops every eight columns was not suitable for the international community and broke historical  
38068 precedents for some vendors in the FORTRAN community, so **-t** was restored in conjunction  
38069 with the list of valid extension categories considered by the standard developers. Thus, *unexpand*  
38070 is now the logical converse of *expand*.

**38071 FUTURE DIRECTIONS**

38072 None.

**38073 SEE ALSO**

38074 *expand*, *tabs*

**38075 CHANGE HISTORY**

38076 First released in Issue 4.

**38077 Issue 6**

38078 This utility is now marked as part of the User Portability Utilities option. |

38079 The definition of the *LC\_CTYPE* environment variable is changed to align with the |  
38080 IEEE P1003.2b draft standard. |

38081 The normative text is reworded to avoid use of the term “must” for application requirements. |

38082 **NAME**38083           unget — undo a previous get of an SCCS file (**DEVELOPMENT**)38084 **SYNOPSIS**38085 xSI       unget [-ns][-r *SID*] *file...*

38086

38087 **DESCRIPTION**38088       The *unget* utility shall reverse the effect of a *get -e* done prior to creating the intended new delta.38089 **OPTIONS**38090       The *unget* utility shall conform to the System Interface Definitions volume of  
38091       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

38092       The following options shall be supported:

38093       -r *SID*       Uniquely identify which delta is no longer intended. (This would have been  
38094                      specified by *get* as the new delta.) The use of this option is necessary only if two or  
38095                      more outstanding *get* commands for editing on the same SCCS file were done by  
38096                      the same person (login name).

38097       -s           Suppress the writing to standard output of the intended delta's SID.

38098       -n           Retain the file that was obtained by *get*, which would normally be removed from  
38099                      the current directory.38100 **OPERANDS**

38101       The following operands shall be supported:

38102       *file*        A path name of an existing SCCS file or a directory. If *file* is a directory, *unget*  
38103                      behaves as though each file in the directory were specified as a named file, except  
38104                      that non-SCCS files (last component of the path name does not begin with *s.*) and  
38105                      unreadable files shall be silently ignored.38106                      If a single instance *file* is specified as '-', the standard input shall be read; each  
38107                      line of the standard input is taken to be the name of an SCCS file to be processed.  
38108                      Non-SCCS files and unreadable files shall be silently ignored.38109 **STDIN**38110       The standard input shall be a text file used only when the *file* operand is specified as '-'. Each  
38111       line of the text file shall be interpreted as an SCCS path name.38112 **INPUT FILES**

38113       Any SCCS files processed are files of an unspecified format.

38114 **ENVIRONMENT VARIABLES**38115       The following environment variables shall affect the execution of *unget*:38116       LANG        Provide a default value for the internationalization variables that are unset or null.  
38117                      If *LANG* is unset or null, the corresponding value from the implementation-  
38118                      dependent default locale shall be used. If any of the internationalization variables  
38119                      contains an invalid setting, the utility shall behave as if none of the variables had  
38120                      been defined.38121       LC\_ALL       If set to a non-empty string value, override the values of all the other  
38122                      internationalization variables.38123       LC\_CTYPE     Determine the locale for the interpretation of sequences of bytes of text data as  
38124                      characters (for example, single-byte as opposed to multi-byte characters in  
38125                      arguments and input files).

38126 **LC\_MESSAGES**

38127 Determine the locale that should be used to affect the format and contents of  
38128 diagnostic messages written to standard error.

38129 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

38130 **ASYNCHRONOUS EVENTS**

38131 Default.

38132 **STDOUT**

38133 The standard output shall consist of a line for each file, in the following format:

38134 "%s\n", <*SID removed from file*>

38135 If there is more than one named file or if a directory or standard input is named, each path name  
38136 shall be written before each of the preceding lines:

38137 "\n%s:\n", <*pathname*>

38138 **STDERR**

38139 Used only for diagnostic messages.

38140 **OUTPUT FILES**

38141 Any SCCS files updated are files of an unspecified format. During processing of a *file*, a locking  
38142 *z-file*, as described in *get*, and a *q-file* (a working copy of the *p-file*), may be created and deleted.  
38143 The *p-file* and *g-file*, as described in *get*, shall be deleted.

38144 **EXTENDED DESCRIPTION**

38145 None.

38146 **EXIT STATUS**

38147 The following exit values shall be returned:

38148 0 Successful completion.

38149 >0 An error occurred.

38170 **NAME**

38171           uniq — report or filter out repeated lines in a file

38172 **SYNOPSIS**38173           uniq [-c|-d|-u][-f *fields*][-s *char*][*input\_file* [*output\_file*]]38174 **DESCRIPTION**

38175           The *uniq* utility shall read an input file comparing adjacent lines, and writes one copy of each  
 38176           input line on the output. The second and succeeding copies of repeated adjacent input lines shall  
 38177           not be written.

38178           Repeated lines in the input shall not be detected if they are not adjacent.

38179 **OPTIONS**

38180           The *uniq* utility shall conform to the System Interface Definitions volume of  
 38181           IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

38182           The following options shall be supported:

38183           -c           Precede each output line with a count of the number of times the line occurred in  
 38184           the input.

38185           -d           Suppress the writing of lines that are not repeated in the input.

38186           -f *fields*   Ignore the first *fields* fields on each input line when doing comparisons, where  
 38187           *fields* is a positive decimal integer. A field is the maximal string matched by the  
 38188           basic regular expression:

38189           [[[:blank:]]]\*^[[:blank:]]\*

38190           If the *fields* option-argument specifies more fields than appear on an input line, a  
 38191           null string shall be used for comparison.

38192           -s *chars*   Ignore the first *chars* characters when doing comparisons, where *chars* shall be a  
 38193           positive decimal integer. If specified in conjunction with the -f option, the first  
 38194           *chars* characters after the first *fields* fields shall be ignored. If the *chars* option-  
 38195           argument specifies more characters than remain on an input line, a null string shall  
 38196           be used for comparison.

38197           -u           Suppress the writing of lines that are repeated in the input.

38198 **OPERANDS**

38199           The following operands shall be supported:

38200           *input\_file*   A path name of the input file. If the *input\_file* operand is not specified, or if the  
 38201           *input\_file* is '-', the standard input is used.

38202           *output\_file*   A path name of the output file. If the *output\_file* operand is not specified, the  
 38203           standard output shall be used. The results are unspecified if the file named by  
 38204           *output\_file* is the file named by *input\_file*.

38205 **STDIN**

38206           The standard input shall be used only if no *input\_file* operand is specified or if *input\_file* is '-'.  
 38207           See the INPUT FILES section.

38208 **INPUT FILES**

38209           The input file shall be a text file.

**38210 ENVIRONMENT VARIABLES**

38211 The following environment variables shall affect the execution of *uniq*:

38212 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 38213 If *LANG* is unset or null, the corresponding value from the implementation-  
 38214 dependent default locale shall be used. If any of the internationalization variables  
 38215 contains an invalid setting, the utility shall behave as if none of the variables had  
 38216 been defined.

38217 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 38218 internationalization variables.

38219 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 38220 characters (for example, single-byte as opposed to multi-byte characters in  
 38221 arguments and input files) which characters constitute a <blank> character in the  
 38222 current locale.

38223 *LC\_MESSAGES*

38224 Determine the locale that should be used to affect the format and contents of  
 38225 diagnostic messages written to standard error.

38226 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**38227 ASYNCHRONOUS EVENTS**

38228 Default.

**38229 STDOUT**

38230 The standard output shall be used only if no *output\_file* operand is specified. See the OUTPUT  
 38231 FILES section.

**38232 STDERR**

38233 Used only for diagnostic messages.

**38234 OUTPUT FILES**

38235 If the *-c* option is specified, the application shall ensure that the output file is empty or each line  
 38236 shall be of the form:

38237 "%d %s", <number of duplicates>, <line>

38238 otherwise, the application shall ensure that the output file is empty or each line shall be of the  
 38239 form:

38240 "%s", <line>

**38241 EXTENDED DESCRIPTION**

38242 None.

**38243 EXIT STATUS**

38244 The following exit values shall be returned:

38245 0 The utility executed successfully.

38246 >0 An error occurred.

**38247 CONSEQUENCES OF ERRORS**

38248 Default.

## 38249 APPLICATION USAGE

38250 The *sort* utility can be used to cause repeated lines to be adjacent in the input file.

## 38251 EXAMPLES

38252 The following input file data (but flushed left) was used for a test series on *uniq*:

```
38253 #01 foo0 bar0 fool bar1
38254 #02 bar0 fool bar1 fool
38255 #03 foo0 bar0 fool bar1
38256 #04
38257 #05 foo0 bar0 fool bar1
38258 #06 foo0 bar0 fool bar1
38259 #07 bar0 fool bar1 foo0
```

38260 What follows is a series of test invocations of the *uniq* utility that use a mixture of *uniq* options  
38261 against the input file data. These tests verify the meaning of *adjacent*. The *uniq* utility views the  
38262 input data as a sequence of strings delimited by '\n'. Accordingly, for the *fieldsth* member of  
38263 the sequence, *uniq* interprets unique or repeated adjacent lines strictly relative to the *fields+1*th  
38264 member.

- 38265 1. This first example tests the line counting option, comparing each line of the input file data  
38266 starting from the second field:

```
38267 uniq -c -f 1 uniq_0I.t
38268 1 #01 foo0 bar0 fool bar1
38269 1 #02 bar0 fool bar1 foo0
38270 1 #03 foo0 bar0 fool bar1
38271 1 #04
38272 2 #05 foo0 bar0 fool bar1
38273 1 #07 bar0 fool bar1 foo0
```

38274 The number '2', prefixing the fifth line of output, signifies that the *uniq* utility detected a  
38275 pair of repeated lines. Given the input data, this can only be true when *uniq* is run using  
38276 the *-f 1* option (which shall cause *uniq* to ignore the first field on each input line).

- 38277 2. The second example tests the option to suppress unique lines, comparing each line of the  
38278 input file data starting from the second field:

```
38279 uniq -d -f 1 uniq_0I.t
38280 #05 foo0 bar0 fool bar1
```

- 38281 3. This test suppresses repeated lines, comparing each line of the input file data starting from  
38282 the second field:

```
38283 uniq -u -f 1 uniq_0I.t
38284 #01 foo0 bar0 fool bar1
38285 #02 bar0 fool bar1 fool
38286 #03 foo0 bar0 fool bar1
38287 #04
38288 #07 bar0 fool bar1 foo0
```

- 38289 4. This suppresses unique lines, comparing each line of the input file data starting from the  
38290 third character:

```
38291 uniq -d -s 2 uniq_0I.t
```

38292 In the last example, the *uniq* utility found no input matching the above criteria.

38293 **RATIONALE**

38294           Some historical implementations have limited lines to be 1 080 bytes in length, which does not  
38295           meet the implied {LINE\_MAX} limit.

38296           The **-f** and **-s** options were added to replace the obsolescent **-n** and **+m** options so that *uniq*  
38297           could meet the syntax guidelines in an upward-compatible way.

38298 **FUTURE DIRECTIONS**

38299           None.

38302 **CHANGE HISTORY**

38303           First released in Issue 2.

38304 **Issue 4**

38305           Aligned with the ISO/IEC 9945-2: 1993 standard.

38306 **Issue 6**

38307           The obsolescent SYNOPSIS and associated text are removed. |

38308           The normative text is reworded to avoid use of the term “must” for application requirements. |

38309 **NAME**

38310 unlink — call the *unlink()* function

38311 **SYNOPSIS**

38312 xSI unlink *file*

38313

38314 **DESCRIPTION**

38315 The *unlink* utility shall perform the function call:

38316 unlink(*file*);

38317 A user may need appropriate privilege to invoke the *unlink* utility.

38318 **OPTIONS**

38319 None.

38320 **OPERANDS**

38321 The following operands shall be supported:

38322 *file* The path name of an existing file.

38323 **STDIN**

38324 Not used.

38325 **INPUT FILES**

38326 Not used.

38327 **ENVIRONMENT VARIABLES**

38328 The following environment variables shall affect the execution of *unlink*:

38329 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 38330 If *LANG* is unset or null, the corresponding value from the implementation-  
 38331 dependent default locale shall be used. If any of the internationalization variables  
 38332 contain an invalid setting, the utility behaves as if none of the variables had been  
 38333 set.

38334 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 38335 internationalization variables.

38336 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 38337 characters (for example, single-byte as opposed to multi-byte characters in  
 38338 arguments).

38339 *LC\_MESSAGES*  
 38340 Determine the locale that should be used to affect the format and contents of  
 38341 diagnostic messages written to standard error.

38342 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

38343 **ASYNCHRONOUS EVENTS**

38344 Default.

38345 **STDOUT**

38346 None.

38347 **STDERR**

38348 Used only for diagnostic messages.

**38349 OUTPUT FILES**

38350 None.

**38351 EXTENDED DESCRIPTION**

38352 None.

**38353 EXIT STATUS**

38354 The following exit values shall be returned:

**38369 CHANGE HISTORY**

38370 First released in Issue 5.

## 38371 NAME

38372 uucp — system-to-system copy

## 38373 SYNOPSIS

38374 UN XSI uucp [-cCdfjmr][*-n user*] *source-file... destination-file*

38375

## 38376 DESCRIPTION

38377 The *uucp* utility shall copy files named by the *source-file* arguments to the *destination-file*  
38378 argument. The files named can be on local or remote systems.38379 The *uucp* utility cannot guarantee support for all character encodings in all circumstances. For  
38380 example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
38381 file names need not be portable to non-internationalized systems, and so on. Under these  
38382 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
38383 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used,  
38384 and that only characters defined in the Portable File Name Character Set be used for naming  
38385 files.

## 38386 OPTIONS

38387 The *uucp* utility shall conform to the System Interface Definitions volume of  
38388 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

38389 The following options shall be supported:

38390 **-c** Do not copy local file to the spool directory for transfer to the remote machine  
38391 (default).38392 UN **-C** Force the copy of local files to the spool directory for transfer.38393 **-d** Make all necessary directories for the file copy (default).38394 UN **-f** Do not make intermediate directories for the file copy.38395 UN **-j** Write the job identification string to standard output. This job identification can be  
38396 used by *uustat* to obtain the status or terminate a job.38397 **-m** Send mail to the requester when the copy is completed.38398 UN **-n user** Notify *user* on the remote system that a file was sent.38399 UN **-r** Do not start the file transfer; just queue the job.

## 38400 OPERANDS

38401 The following operands shall be supported:

38402 *destination-file, source-file*38403 A path name of a file to be copied to, or from, respectively. Either name can be a  
38404 path name on the local machine, or can have the form:38405 *system-name!pathname*38406 where *system-name* is taken from a list of system names that *uucp* knows about.  
38407 The destination *system-name* can also be a list of names such as:38408 *system-name!system-name!...!system-name!pathname*38409 in which case, an attempt is made to send the file via the specified route to the  
38410 destination. Care should be taken to ensure that intermediate nodes in the route  
38411 are willing to forward information.

38412 The shell pattern matching notation characters '?', '\*', and "[...]" appearing  
38413 in *pathname* are expanded on the appropriate system.

38414 Path names can be one of:

- 38415 1. An absolute path name.
- 38416 2. A path name preceded by *~user* where *user* is a login name on the specified  
38417 system and is replaced by that user's login directory. Note that if an invalid  
38418 login is specified, the default is to the public directory (called *PUBDIR*; the  
38419 actual location of *PUBDIR* is implementation-dependent).
- 38420 3. A path name preceded by *~/destination* where *destination* is appended to  
38421 *PUBDIR*.

38422 **Note:** This destination is treated as a file name unless more than one file  
38423 is being transferred by this request or the destination is already a  
38424 directory. To ensure that it is a directory, follow the destination  
38425 with a '/'. For example, *~/dan/* as the destination makes the  
38426 directory **PUBDIR/dan** if it does not exist and put the requested  
38427 files in that directory.

- 38428 4. Anything else is prefixed by the current directory.

38429 If the result is an erroneous path name for the remote system, the copy fails. If the  
38430 *destination-file* is a directory, the last part of the *source-file* name is used.

38431 The read, write, and execute permissions given by *uucp* are implementation-  
38432 dependent.

#### 38433 **STDIN**

38434 Not used.

#### 38435 **INPUT FILES**

38436 The files to be copied are regular files.

#### 38437 **ENVIRONMENT VARIABLES**

38438 The following environment variables shall affect the execution of *uucp*:

38439 **LANG** Provide a default value for the internationalization variables that are unset or null.  
38440 If *LANG* is unset or null, the corresponding value from the implementation-  
38441 dependent default locale shall be used. If any of the internationalization variables  
38442 contains an invalid setting, the utility shall behave as if none of the variables had  
38443 been defined.

38444 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
38445 internationalization variables.

38446 **LC\_COLLATE**  
38447 Determine the locale for the behavior of ranges, equivalence classes and multi-  
38448 character collating elements within bracketed file name patterns.

38449 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
38450 characters (for example, single-byte as opposed to multi-byte characters in  
38451 arguments and input files) and the behavior of character classes within bracketed  
38452 file name patterns (for example, "[[:lower:]]\*").

#### 38453 **LC\_MESSAGES**

38454 Determine the locale that should be used to affect the format and contents of  
38455 diagnostic messages written to standard error, and informative messages written

38456 to standard output.

38457 *LC\_TIME* Determine the format of date and time strings output by *uucp*.

38458 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

38459 *TZ* Determine the timezone used with date and time strings.

#### 38460 **ASYNCHRONOUS EVENTS**

38461 Default.

#### 38462 **STDOUT**

38463 Not used.

#### 38464 **STDERR**

38465 Used only for diagnostic messages.

#### 38466 **OUTPUT FILES**

38467 The output files (which may be on other systems) are copies of the input files.

38468 If the *-m* is used, mail files are modified.

#### 38469 **EXTENDED DESCRIPTION**

38470 None.

#### 38471 **EXIT STATUS**

38472 The following exit values shall be returned:

38473 0 Successful completion.

38474 >0 An error occurred.

#### 38475 **CONSEQUENCES OF ERRORS**

38476 Default.

#### 38477 **APPLICATION USAGE**

38478 The domain of remotely accessible files can (and for obvious security reasons usually should) be  
38479 severely restricted.

38480 Note that the '!' character in addresses has to be escaped when using *cs*h as a command  
38481 interpreter because of its history substitution syntax. For *ksh* and *sh* the escape is not necessary,  
38482 but may be used.

38483 Typical implementations of this utility require a communications line configured to use the  
38484 System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal  
38485 Interface, but other communications means may be used. On systems where there are no  
38486 available communications means (either temporarily or permanently), this utility shall write an  
38487 error message describing the problem and exit with a non-zero exit status.

38488 As noted above, shell metacharacters appearing in path names are expanded on the appropriate  
38489 system. On an internationalized system, this is done under the control of local settings of  
38490 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed file name  
38491 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
38492 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
38493 need not be supported on non-internationalized systems.

#### 38494 **EXAMPLES**

38495 None.

38496 **RATIONALE**

38497 None.

38498 **FUTURE DIRECTIONS**

38499 None.

38500 **SEE ALSO**38501 *mailx, uuencode, uustat, uux*38502 **CHANGE HISTORY**

38503 First released in Issue 2.

38504 **Issue 4**

38505 Format reorganized.

38506 Split into a separate description.

38507 Utility Syntax Guidelines support mandated.

38508 Internationalized environment variable support mandated.

38509 Presence of the utility mandated, even on systems where no communications are available.

38510 **NAME**

38511           uudecode — decode a binary file

38512 **SYNOPSIS**38513 UP       uudecode [-o *outfile*][*file*]

38514

38515 **DESCRIPTION**

38516       The *uudecode* utility shall read a file, or standard input if no file is specified, that includes data  
 38517       created by the *uuencode* utility. The *uudecode* utility shall scan the input file, searching for data  
 38518       compatible with one of the formats specified in *uuencode* and attempt to create or overwrite the  
 38519       file described by the data (or overridden by the *-o* option). The path name shall be contained in  
 38520       the data or specified by the *-o* option. The file access permission bits and contents for the file to  
 38521       be produced shall be contained in that data. The mode bits of the created file (other than  
 38522       standard output) shall be set from the file access permission bits contained in the data; that is,  
 38523       other attributes of the mode, including the file mode creation mask (see *umask*), shall not affect  
 38524       the file being produced.

38525       If the path name of the file to be produced exists, and the user does not have write permission on  
 38526       that file, *uudecode* shall terminate with an error. If the path name of the file to be produced exists,  
 38527       and the user has write permission on that file, the existing file shall be overwritten.

38528       If the input data was produced by *uuencode* on a system with a different number of bits per byte  
 38529       than on the target system, the results of *uudecode* are unspecified.

38530 **OPTIONS**

38531       The *uudecode* utility shall conform to the System Interface Definitions volume of  
 38532       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

38533       The following option shall be supported by the implementation:

38534       *-o outfile*   A path name of a file that shall be used instead of any path name contained in the  
 38535       input data. Specifying an *outfile* option-argument of */dev/stdout* shall indicate  
 38536       standard output.

38537 **OPERANDS**

38538       The following operand shall be supported:

38539       *file*           The path name of a file containing the output of *uuencode*.

38540 **STDIN**

38541       See the INPUT FILES section.

38542 **INPUT FILES**

38543       The input files shall be files containing the output of *uuencode*.

38544 **ENVIRONMENT VARIABLES**

38545       The following environment variables shall affect the execution of *uudecode*:

38546       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 38547       If *LANG* is unset or null, the corresponding value from the implementation-  
 38548       dependent default locale shall be used. If any of the internationalization variables  
 38549       contains an invalid setting, the utility shall behave as if none of the variables had  
 38550       been defined.

38551       *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 38552       internationalization variables.

38553       *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
 38554       characters (for example, single-byte as opposed to multi-byte characters in

38555 arguments and input files).

38556 **LC\_MESSAGES**

38557 Determine the locale that should be used to affect the format and contents of

38558 diagnostic messages written to standard error.

38559 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

38560 **ASYNCHRONOUS EVENTS**

38561 Default.

38562 **STDOUT**

38563 If the file data header encoded by *uuencode* is **-** or **/dev/stdout**, or the **-o /dev/stdout** option

38564 overrides the file data, the standard output shall be in the same format as the file originally

38565 encoded by *uuencode*. Otherwise, the standard output shall not be used.

38566 **STDERR**

38567 Used only for diagnostic messages.

38568 **OUTPUT FILES**

38569 The output file shall be in the same format as the file originally encoded by *uuencode*.

38570 **EXTENDED DESCRIPTION**

38571 None.

38572 **EXIT STATUS**

38573 The following exit values shall be returned:

38574 0 Successful completion.

38575 >0 An error occurred.

38576 **CONSEQUENCES OF ERRORS**

38577 Default.

38578 **APPLICATION USAGE**

38579 The user who is invoking *uudecode* must have write permission on any file being created.

38580 The output of *uuencode* is essentially an encoded bit stream that is not cognizant of byte

38581 boundaries. It is possible that a 9-bit byte target machine can process input from an 8-bit source,

38582 if it is aware of the requirement, but the reverse is unlikely to be satisfying. Of course, the only

38583 data that is meaningful for such a transfer between architectures is generally character data.

38584 Application writers should note that this utility need not be provided on systems that do not

38585 support the User Portability Utilities option.

38586 **EXAMPLES**

38587 None.

38588 **RATIONALE**

38589 Input files are not necessarily text files, as stated by an early proposal. Although the *uuencode*

38590 output is a text file, that output could have been wrapped within another file or mail message

38591 that is not a text file.

38592 The **-o** option is not historical practice, but was added at the request of WG15 so that the user

38593 could override the target path name without having to edit the input data itself.

38594 In early drafts, the **[-o outfile]** option-argument allowed the use of **-** to mean standard output.

38595 The symbol **-** has only been used previously in IEEE Std. 1003.1-200x as a standard input

38596 indicator. The developers of the standard did not wish to overload the meaning of **-** in this

38597 manner. The **/dev/stdout** concept exists on most modern systems. The **/dev/stdout** syntax does

38598 not refer to a new special file. It is just a magic cookie to specify standard output. |

38599 **FUTURE DIRECTIONS**

38600 None.

38601 **SEE ALSO**

38602 *uuencode*

38603 **CHANGE HISTORY**

38604 First released in Issue 4.

38605 **Issue 6**

38606 This utility is now marked as part of the User Portability Utilities option. |

38607 The **-o outfile** option is added, as specified in the IEEE P1003.2b draft standard. |

38608 The normative text is reworded to avoid use of the term “must” for application requirements. |

38609 **NAME**

38610 uuencode — encode a binary file

38611 **SYNOPSIS**38612 UP uuencode [-m][*file*] *decode\_pathname*

38613

38614 **DESCRIPTION**

38615 The *uuencode* utility shall write an encoded version of the named input file, or standard input if  
 38616 no *file* is specified, to standard output. The output shall be encoded using one of the algorithms  
 38617 described in the STDOUT section and shall include the file access permission bits (in *chmod* octal  
 38618 or symbolic notation) of the input file and the *decode\_pathname*, for re-creation of the file on  
 38619 another system that conforms to this volume of IEEE Std. 1003.1-200x.

38620 **OPTIONS**

38621 The *uuencode* utility shall conform to the System Interface Definitions volume of  
 38622 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

38623 The following option shall be supported by the implementation:

38624 **-m** Encode the output using the MIME Base64 algorithm described below. If **-m** is not  
 38625 specified, the historical algorithm described in STDOUT shall be used.

38626 **OPERANDS**

38627 The following operands shall be supported:

38628 *decode\_pathname*

38629 The path name of the file into which the *uudecode* utility shall place the decoded  
 38630 file. Specifying a *decode\_pathname* operand of **/dev/stdout** shall indicate that  
 38631 *uudecode* is to use standard output. If there are characters in *decode\_pathname* that  
 38632 are not in the portable file name character set the results are unspecified.

38633 *file* A path name of the file to be encoded.

38634 **STDIN**

38635 See the INPUT FILES section.

38636 **INPUT FILES**

38637 Input files can be files of any type.

38638 **ENVIRONMENT VARIABLES**

38639 The following environment variables shall affect the execution of *uuencode*:

38640 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 38641 If **LANG** is unset or null, the corresponding value from the implementation-  
 38642 dependent default locale shall be used. If any of the internationalization variables  
 38643 contains an invalid setting, the utility shall behave as if none of the variables had  
 38644 been defined.

38645 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 38646 internationalization variables.

38647 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 38648 characters (for example, single-byte as opposed to multi-byte characters in  
 38649 arguments and input files).

38650 **LC\_MESSAGES**

38651 Determine the locale that should be used to affect the format and contents of  
 38652 diagnostic messages written to standard error.

38653 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

38654 **ASYNCHRONOUS EVENTS**

38655 Default.

38656 **STDOUT**

38657 **uuencode Base64 Algorithm**

38658 The standard output shall be a text file (encoded in the character set of the current locale) that  
38659 begins with the line:

38660 "begin-base64ss\n", *<mode>*, *decode\_pathname*

38661 and ends with the line:

38662 "====\n"

38663 In both cases, the lines shall have no preceding or trailing <blank>s.

38664 The encoding process represents 24-bit groups of input bits as output strings of four encoded  
38665 characters. Preceding from left to right, a 24-bit input group shall be formed by concatenating  
38666 three 8-bit input groups. These 24-bit then shall be treated as four concatenated 6-bit groups,  
38667 each of which shall be translated into a single digit in the base64 alphabet. When encoding a bit  
38668 stream via the base64 encoding, the bit stream shall be presumed to be ordered with the most-  
38669 significant bit first. That is, the first bit in the stream shall be the high-order bit in the first byte,  
38670 and the eighth bit shall be the low-order bit in the first byte, and so on. Each 6-bit group is used  
38671 as an index into an array of 64 printable characters, as shown in Table 4-21.

38672 **Table 4-21 uuencode Base64 Values**

| Value | Encoding | Value | Encoding | Value | Encoding | Value | Encoding |
|-------|----------|-------|----------|-------|----------|-------|----------|
| 0     | A        | 17    | R        | 34    | i        | 51    | z        |
| 1     | B        | 18    | S        | 35    | j        | 52    | 0        |
| 2     | C        | 19    | T        | 36    | k        | 53    | 1        |
| 3     | D        | 20    | U        | 37    | l        | 54    | 2        |
| 4     | E        | 21    | V        | 38    | m        | 55    | 3        |
| 5     | F        | 22    | W        | 39    | n        | 56    | 4        |
| 6     | G        | 23    | X        | 40    | o        | 57    | 5        |
| 7     | H        | 24    | Y        | 41    | p        | 58    | 6        |
| 8     | I        | 25    | Z        | 42    | q        | 59    | 7        |
| 9     | J        | 26    | a        | 43    | r        | 60    | 8        |
| 10    | K        | 27    | b        | 44    | s        | 61    | 9        |
| 11    | L        | 28    | c        | 45    | t        | 62    | +        |
| 12    | M        | 29    | d        | 46    | u        | 63    | /        |
| 13    | N        | 30    | e        | 47    | v        | (pad) | =        |
| 14    | O        | 31    | f        | 48    | w        |       |          |
| 15    | P        | 32    | g        | 49    | x        |       |          |
| 16    | Q        | 33    | h        | 50    | y        |       |          |

38691 The character referenced by the index shall be placed in the output string.

38692 The output stream (encoded bytes) shall be represented in lines of no more than 76 characters  
38693 each. All line breaks or other characters not found in the table shall be ignored by decoding  
38694 software (see *uudecode*).

38695 Special processing shall be performed if fewer than 24 bits are available at the end of a message  
38696 or encapsulated part of a message. A full encoding quantum shall always be completed at the

38697 end of a message. When fewer than 24 input bits are available in an input group, zero bits shall  
 38698 be added (on the right) to form an integral number of 6-bit groups. Output character positions  
 38699 that are not required to represent actual input data shall be set to the character '='. Since all  
 38700 base64 input is an integral number of octets, only the following cases can arise:

- 38701 1. The final quantum of encoding input is an integral multiple of 24 bits; here, the final unit of  
 38702 encoded output shall be an integral multiple of 4 characters with no '=' padding.
- 38703 2. The final quantum of encoding input is exactly 8 bits; here, the final unit of encoded output  
 38704 shall be two characters followed by two '=' padding characters.
- 38705 3. The final quantum of encoding input is exactly 16 bits; here, the final unit of encoded  
 38706 output shall be three characters followed by one '=' padding character.
- 38707 4. The terminating "====" evaluates to nothing and denotes the end of the encoded data.

### 38708 uuencode Historical Algorithm

38709 The standard output shall be a text file (encoded in the character set of the current locale) that  
 38710 begins with the line:

38711 "beginΔ%sΔ%s\n" <mode>, <decode\_pathname>

38712 and ends with the line:

38713 end\n

38714 In both cases, the lines shall have no preceding or trailing <blank> characters.

38715 The algorithm that shall be used for lines in between **begin** and **end** takes three octets as input  
 38716 and writes four characters of output by splitting the input at six-bit intervals into four octets,  
 38717 containing data in the lower six bits only. These octets shall be converted to characters by adding  
 38718 a value of 0x20 to each octet, so that each octet is in the range 0x20-0x5f, and then it shall be  
 38719 assumed to represent a printable character in the ISO/IEC 646:1991 standard encoded character  
 38720 set. It then shall be translated into the corresponding character codes for the codeset in use in the  
 38721 current locale. (For example, the octet 0x41, representing 'A', would be translated to 'A' in the  
 38722 current codeset, such as 0xc1 if it were EBCDIC.)

38723 Where the bits of two octets are combined, the least significant bits of the first octet shall be  
 38724 shifted left and combined with the most significant bits of the second octet shifted right. Thus  
 38725 the three octets *A*, *B*, *C* shall be converted into the four octets:

38726  $0x20 + ((A \gg 2) \& 0x3F)$   
 38727  $0x20 + (((A \ll 4) \mid ((B \gg 4) \& 0xF)) \& 0x3F)$   
 38728  $0x20 + (((B \ll 2) \mid ((C \gg 6) \& 0x3)) \& 0x3F)$   
 38729  $0x20 + ((C) \& 0x3F)$

38730 These octets then shall be translated into the local character set.

38731 Each encoded line contains a length character, equal to the number of characters to be decoded  
 38732 plus 0x20 translated to the local character set as described above, followed by the encoded  
 38733 characters. The maximum number of octets to be encoded on each line shall be 45.

### 38734 STDERR

38735 Used only for diagnostic messages.

### 38736 OUTPUT FILES

38737 None.

38738 **EXTENDED DESCRIPTION**

38739 None.

38740 **EXIT STATUS**

38741 The following exit values shall be returned:

38742 0 Successful completion.

38743 &gt;0 An error occurred.

38744 **CONSEQUENCES OF ERRORS**

38745 Default.

38746 **APPLICATION USAGE**

38747 The file is expanded by 35 percent (each three octets become four, plus control information)  
38748 causing it to take longer to transmit.

38749 Since this utility is intended to create files to be used for data interchange between systems with  
38750 possibly different codesets, and to represent binary data as a text file, the ISO/IEC 646:1991  
38751 standard was chosen for a midpoint in the algorithm as a known reference point. The output  
38752 from *uuencode* is a text file on the local system. If the output were in the ISO/IEC 646:1991  
38753 standard codeset, it might not be a text file (at least because the <newline> characters might not  
38754 match), and the goal of creating a text file would be defeated. If this text file was then carried to  
38755 another machine with the same codeset, it would be perfectly compatible with that system's  
38756 *uudecode*. If it was transmitted over a mail system or sent to a machine with a different codeset,  
38757 it is assumed that, as for every other text file, some translation mechanism would convert it (by  
38758 the time it reached a user on the other system) into an appropriate codeset. This translation only  
38759 makes sense from the local codeset, not if the file has been put into a ISO/IEC 646:1991 standard  
38760 representation first. Similarly, files processed by *uuencode* can be placed in *pax* archives,  
38761 intermixed with other text files in the same codeset.

38762 The algorithm is described in terms of 8-bit quantities, or octets. Since no byte alignment is  
38763 implied, it encodes data from machines with any number of bits per byte. However, unless that  
38764 encoded data is then decoded on a machine with the same number of bits per byte, the output  
38765 might not be useful.

38766 Application writers should note that this utility need not be provided on systems that do not  
38767 support the User Portability Utilities option.

38768 **EXAMPLES**

38769 None.

38770 **RATIONALE**

38771 A new algorithm was added at the request of the international community to parallel work in  
38772 RFC 2045 (MIME). As with the historical *uuencode* format, the Base64 Content-Transfer-Encoding  
38773 is designed to represent arbitrary sequences of octets in a form that is not humanly readable. A  
38774 65-character subset of the ISO/IEC 646:1991 standard is used, enabling 6 bits to be represented  
38775 per printable character. (The extra 65th character, '=', is used to signify a special processing  
38776 function.)

38777 This subset has the important property that it is represented identically in all versions of the  
38778 ISO/IEC 646:1991 standard, including US ASCII, and all characters in the subset are also  
38779 represented identically in all versions of EBCDIC. The historical *uuencode* algorithm does not  
38780 share this property, which is the reason that a second algorithm was added to the ISO POSIX-2  
38781 standard.

38782 The string "====" was used for the termination instead of the end used in the original format  
38783 because the latter is a string that could be valid encoded input.

38784 In an early draft, the **-m** option was named **-b** (for Base64), but it was renamed to reflect its  
38785 relationship to the RFC 2045. A **-u** was also present to invoke the default algorithm, but since  
38786 this was not historical practice, it was omitted as being unnecessary.

38787 See the RATIONALE section in *uudecode* for the derivation of the **/dev/stdout** symbol.

38788 **FUTURE DIRECTIONS**

38789 None.

38790 **SEE ALSO**

38791 *mailx*, *uudecode*

38792 **CHANGE HISTORY**

38793 First released in Issue 4.

38794 **Issue 6**

38795 This utility is now marked as part of the User Portability Utilities option.

38796 The Base64 algorithm and the ability to output to **/dev/stdout** are added as specified in the  
38797 IEEE P1003.2b draft standard.

38798 **NAME**

38799           uustat — uucp status inquiry and job control

38800 **SYNOPSIS**38801 UN XSI    uustat [ -q | -k *jobid* | -r *jobid* ]38802 XSI       uustat [-s *system*][-u *user*]38803 **DESCRIPTION**38804           The *uustat* utility shall display the status of, or cancel, previously specified *uucp* requests, or  
38805           provide general status on *uucp* connections to other systems.38806           When no options are given, *uustat* shall write to standard output the status of all *uucp* requests  
38807           issued by the current user.38808           Typical implementations of this utility require a communications line configured to use the  
38809           System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal  
38810           Interface, but other communications means may be used. On systems where there are no  
38811           available communications means (either temporarily or permanently), this utility shall write an  
38812           error message describing the problem and exits with a non-zero exit status.38813 **OPTIONS**38814           The *uustat* utility shall conform to the System Interface Definitions volume of  
38815           IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

38816           The following options shall be supported:

38817 UN       **-q**       Write the jobs queued for each machine.38818       **-k *jobid***   Kill the *uucp* request whose job identification is *jobid*. The application shall ensure  
38819                      that the killed *uucp* request belongs to the person invoking *uustat* unless that user  
38820                      has appropriate privileges.38821       **-r *jobid***   Rejuvenate *jobid*. The files associated with *jobid* are touched so that their  
38822                      modification time is set to the current time. This prevents the cleanup program  
38823                      from deleting the job until the jobs modification time reaches the limit imposed by  
38824                      the program.38825       **-s *system***   Write the status of all *uucp* requests for remote system *system*.38826       **-u *user***     Write the status of all *uucp* requests issued by *user*.38827 **OPERANDS**

38828           None.

38829 **STDIN**

38830           Not used.

38831 **INPUT FILES**

38832           None.

38833 **ENVIRONMENT VARIABLES**38834           The following environment variables shall affect the execution of *uustat*:38835       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
38836                      If *LANG* is unset or null, the corresponding value from the implementation-  
38837                      dependent default locale shall be used. If any of the internationalization variables  
38838                      contains an invalid setting, the utility shall behave as if none of the variables had  
38839                      been defined.

38840 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 38841 internationalization variables.

38842 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 38843 characters (for example, single-byte as opposed to multi-byte characters in  
 38844 arguments).

38845 *LC\_MESSAGES*  
 38846 Determine the locale that should be used to affect the format and contents of  
 38847 diagnostic messages written to standard error, and informative messages written  
 38848 to standard output.

38849 *LC\_TIME* Determine the format of date and time strings output by *uustat*.

38850 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

38851 *TZ* Determine the timezone used with date and time strings.

38852 **ASYNCHRONOUS EVENTS**  
 38853 Default.

38854 **STDOUT**  
 38855 The standard output shall consist of information about each job selected, in an unspecified  
 38856 format. The information shall include at least the job ID, the user ID or name, and the remote  
 38857 system name.

38858 **STDERR**  
 38859 Used only for diagnostic messages.

38860 **OUTPUT FILES**  
 38861 None.

38862 **EXTENDED DESCRIPTION**  
 38863 None.

38864 **EXIT STATUS**  
 38865 The following exit values shall be returned:  
 38866 0 Successful completion.  
 38867 >0 An error occurred.

38881 First released in Issue 2.

38882 **Issue 4**

38883 Format reorganized.

38884 Utility Syntax Guidelines support mandated.

38885 Internationalized environment variable support mandated.

38886 Presence of the utility mandated, even on systems where no communications are available. |

38887 **Issue 6** |

38888 The normative text is reworded to avoid use of the term “must” for application requirements. |

38889 **NAME**38890 **uux** — remote command execution38891 **SYNOPSIS**38892 XSI `uux [-np] command-string`38893 UN XSI `uux [-jnp] command-string`38894 **DESCRIPTION**

38895 The *uux* utility shall gather zero or more files from various systems, execute a shell pipeline (see  
 38896 Section 2.9 on page 67) on a specified system, and then send the standard output of the  
 38897 command to a file on a specified system. Only the first command of a pipeline can have a  
 38898 *system-name!* prefix. All other commands in the pipeline shall be executed on the system of the  
 38899 first command.

38900 The following restrictions are applicable to the shell pipeline processed by *uux*:

- 38901 • In gathering files from different systems, path name expansion is not performed by *uux*.  
 38902 Thus, a request such as:

38903 `uux "c89 remsys!~/*.c"`

38904 would attempt to copy the file named literally *\*.c* to the local system.

- 38905 • The redirection operators "*>>*", "*<<*", "*>|*", and "*>&*" cannot be used.
- 38906 • The reserved word *!* cannot be used at the head of the pipeline to modify the exit status.
- 38907 • Alias substitution is not performed.

38908 A file name can be specified as for *uucp*; it can be an absolute path name, a path name preceded  
 38909 by *~name* (which is replaced by the corresponding login directory), a path name specified as  
 38910 *~/dest* (*dest* is prefixed by the public directory called *PUBDIR*; the actual location of *PUBDIR* is  
 38911 implementation-dependent), or a simple file name (which is prefixed by *uux* with the current  
 38912 directory). See *uucp* on page 1008 for the details.

38913 The execution of commands on remote systems shall take place in an execution directory known  
 38914 to the *uucp* system. All files required for the execution shall be put into this directory unless they  
 38915 already reside on that machine. Therefore, the application shall ensure that non-local file names  
 38916 (without path or machine reference) are unique within the *uux* request.

38917 The *uux* utility shall attempt to get all files to the execution system. For files that are output files,  
 38918 the application shall ensure that the file name is escaped using parentheses.

38919 The remote system shall notify the user by mail if the requested command on the remote system  
 38920 was disallowed or the files were not accessible. This notification can be turned off by the *-n*  
 38921 option.

38922 Typical implementations of this utility require a communications line configured to use the  
 38923 System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11, General Terminal  
 38924 Interface, but other communications means may be used. On systems where there are no  
 38925 available communications means (either temporarily or permanently), this utility shall write an  
 38926 error message describing the problem and exits with a non-zero exit status.

38927 The *uux* utility cannot guarantee support for all character encodings in all circumstances. For  
 38928 example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
 38929 file names need not be portable to non-internationalized systems, and so on. Under these  
 38930 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
 38931 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used  
 38932 and that only characters defined in the Portable File Name Character Set be used for naming

38933 files.

### 38934 OPTIONS

38935 The *uux* utility shall conform to the System Interface Definitions volume of  
38936 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

38937 The following options shall be supported:

38938 **-p** Make the standard input to *uux* the standard input to the *command-string*.

38939 UN **-j** Write the job identification string to standard output. This job identification can be  
38940 used by *uustat* to obtain the status or terminate a job.

38941 **-n** Do not notify the user if the command fails.

### 38942 OPERANDS

38943 The following operand shall be supported:

38944 *command-string*

38945 A string made up of one or more arguments that are similar to normal command  
38946 arguments, except that the command and any file names can be prefixed by  
38947 *system-name!*. A null *system-name* shall be interpreted as the local system.

### 38948 STDIN

38949 The standard input shall not be used unless the *'-'* or **-p** option is specified; in those cases, the  
38950 standard input shall be made the standard input of the *command-string*.

### 38951 INPUT FILES

38952 Input files shall be selected according to the contents of *command-string*.

### 38953 ENVIRONMENT VARIABLES

38954 The following environment variables shall affect the execution of *uux*:

38955 **LANG** Provide a default value for the internationalization variables that are unset or null.  
38956 If **LANG** is unset or null, the corresponding value from the implementation-  
38957 dependent default locale shall be used. If any of the internationalization variables  
38958 contains an invalid setting, the utility shall behave as if none of the variables had  
38959 been defined.

38960 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
38961 internationalization variables.

38962 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
38963 characters (for example, single-byte as opposed to multi-byte characters in  
38964 arguments).

38965 **LC\_MESSAGES**  
38966 Determine the locale that should be used to affect the format and contents of  
38967 diagnostic messages written to standard error.

38968 **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

### 38969 ASYNCHRONOUS EVENTS

38970 Default.

### 38971 STDOUT

38972 The standard output shall be not used unless the **-j** option is specified; in that case, the job  
38973 identification string shall be written to standard output in the following format:

38974 "%s\n", <jobid>

38975 **STDERR**

38976           Used only for diagnostic messages.

38977 **OUTPUT FILES**

38978           Output files shall be created or written, or both, according to the contents of *command-string*.

38979           If the **-n** is not used, mail files shall be modified following any command or file-access failures  
38980           on the remote system.

38981 **EXTENDED DESCRIPTION**

38982           None.

38983 **EXIT STATUS**

38984           The following exit values shall be returned:

38985           0   Successful completion.

38986           >0  An error occurred.

38987 **CONSEQUENCES OF ERRORS**

38988           Default.

38989 **APPLICATION USAGE**

38990           Note that, for security reasons, many installations limit the list of commands executable on  
38991           behalf of an incoming request from *uux*. Many sites permit little more than the receipt of mail  
38992           via *uux*.

38993           Any characters special to the command interpreter should be quoted either by quoting the entire  
38994           *command-string* or quoting the special characters as individual arguments.

38995           As noted in *uucp*, shell pattern matching notation characters appearing in path names are  
38996           expanded on the appropriate local system. This is done under the control of local settings of  
38997           *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed file name  
38998           patterns, as collation and typing rules may vary from one system to another. Also be aware that  
38999           certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
39000           need not be supported on non-internationalized systems.

39001 **EXAMPLES**

39002           1. The following command gets **file1** from system **a** and **file2** file from system **b**, executes *diff*  
39003           on the local system, and puts the results in **file.diff** in the local *PUBDIR* directory.  
39004           (*PUBDIR* is the *uucp* public directory on the local system.)

39005           uux "!diff a!/usr/file1 b!/a4/file2 >!~/file.diff"

39006           2. The following command fails because *uux* places all files copied to a system in the same  
39007           working directory. Although the files **xyz** are from two different systems, their file names  
39008           are the same and conflict.

39009           uux "!diff a!/usr1/xyz b!/usr2/xyz >!~/xyz.diff"

39010           3. The following command succeeds (assuming *diff* is permitted on system **a**) because the file  
39011           local to system **a** is not copied to the working directory, and hence does not conflict the file  
39012           from system **c**.

39013           uux "a!diff a!/usr/xyz c!/usr/xyz >!~/xyz.diff"

39014 **RATIONALE**

39015 None.

39016 **FUTURE DIRECTIONS**

39017 A version of *uux* that fully supports the System Interface Definitions volume of  
39018 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines may be introduced in a future  
39019 issue.

39020 **SEE ALSO**39021 *uucp, uuencode, uustat*39022 **CHANGE HISTORY**

39023 First released in Issue 2.

39024 **Issue 4**

39025 Format reorganized.

39026 Exceptions to Utility Syntax Guidelines conformance noted.

39027 Internationalized environment variable support mandated.

39028 Presence of the utility mandated, even on systems where no communications are available.

39029 **Issue 6**

39030 The obsolescent SYNOPSIS is removed.

39031 The normative text is reworded to avoid use of the term “must” for application requirements.

39032 **NAME**39033 **val** — validate SCCS files (**DEVELOPMENT**)39034 **SYNOPSIS**39035 **XSI** **val** -39036 **val** [-s][-m *name*][-r *SID*][-y *type*] *file*...

39037

39038 **DESCRIPTION**

39039 The *val* utility shall determine whether the specified *file* is an SCCS file meeting the  
 39040 characteristics specified by the options.

39041 **OPTIONS**

39042 The *val* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 39043 Section 12.2, Utility Syntax Guidelines, except that the usage of the '-' operand is not strictly as  
 39044 intended by the guidelines (that is, reading options and operands from standard input).

39045 The following options shall be supported:

39046 **-m *name*** Specify a *name*, which is compared with the SCCS %M% keyword in *file*; see *get* on  
 39047 page 510.

39048 **-r *SID*** Specify a *SID* (SCCS Identification String), an SCCS delta number. A check is made  
 39049 to determine if the *SID* is ambiguous (for example, **-r 1** is ambiguous because it  
 39050 physically does not exist but implies 1.1, 1.2, and so on, which may exist) or invalid  
 39051 (for example, **-r 1.0** or **-r 1.1.0** are invalid because neither case can exist as a valid  
 39052 delta number). If the *SID* is valid and not ambiguous, a check is made to  
 39053 determine whether it actually exists.

39054 **-s** Silence the diagnostic message normally written to standard output for any error  
 39055 that is detected while processing each named file on a given command line.

39056 **-y *type*** Specify a *type*, which is compared with the SCCS %Y% keyword in *file*; see *get* on  
 39057 page 510.

39058 **OPERANDS**

39059 The following operands shall be supported:

39060 ***file*** A path name of an existing SCCS file. If a single instance *file* is specified as '-',  
 39061 and if no options are specified, the standard input shall be read: each line is  
 39062 independently processed as if it were a command line argument list. (However,  
 39063 the line is not subjected to any of the shell word expansions, such as parameter  
 39064 expansion or quote removal.)

39065 **STDIN**

39066 The standard input is a text file used only when the *file* operand is specified as '-'.

39067 **INPUT FILES**

39068 Any SCCS files processed are files of an unspecified format.

39069 **ENVIRONMENT VARIABLES**

39070 The following environment variables shall affect the execution of *val*:

39071 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 39072 If *LANG* is unset or null, the corresponding value from the implementation-  
 39073 dependent default locale shall be used. If any of the internationalization variables  
 39074 contains an invalid setting, the utility shall behave as if none of the variables had  
 39075 been defined.

39076        *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 39077                   internationalization variables.

39078        *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 39079                   characters (for example, single-byte as opposed to multi-byte characters in  
 39080                   arguments and input files).

39081        *LC\_MESSAGES*  
 39082                   Determine the locale that should be used to affect the format and contents of  
 39083                   diagnostic messages written to standard error, and informative messages written  
 39084                   to standard output.

39085        *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

39086 **ASYNCHRONOUS EVENTS**  
 39087        Default.

39088 **STDOUT**  
 39089        The standard output shall consist of informative messages about either:

39090            1. Each file processed

39091            2. Each command line read from standard input

39092        If the standard input is not used, for each *file* operand yielding a discrepancy, the output line  
 39093        shall have the following format:

39094        "%s: %s\n", <pathname>, <unspecified string>

39095        If standard input is used, a line of input shall be written before each of the preceding lines for  
 39096        files containing discrepancies:

39097        "%s:\n", <input line>

39098 **STDERR**  
 39099        Not used.

39100 **OUTPUT FILES**  
 39101        None.

39102 **EXTENDED DESCRIPTION**  
 39103        None.

39104 **EXIT STATUS**  
 39105        The 8-bit code returned by *val* is a disjunction of the possible errors, that is, it can be interpreted  
 39106        as a bit string where set bits are interpreted as follows:

39107        0x80    =   Missing file argument.

39108        0x40    =   Unknown or duplicate option.

39109        0x20    =   Corrupted SCCS file.

39110        0x10    =   Cannot open file or file not SCCS.

39111        0x08    =   *SID* is invalid or ambiguous.

39112        0x04    =   *SID* does not exist.

39113        0x02    =   %Y%, -y mismatch.

39114        0x01    =   %M%, -m mismatch.

39115        Note that *val* can process two or more files on a given command line and can process multiple  
 39116        command lines (when reading the standard input). In these cases an aggregate code shall be  
 39117        returned: a logical OR of the codes generated for each command line and file processed.

**39118 CONSEQUENCES OF ERRORS**

39119 Default.

**39120 APPLICATION USAGE**

39121 Since the *val* exit status sets the 0x80 bit, shell applications checking "\$?" cannot tell if it  
39122 terminated due to a missing file argument or receipt of a signal.

**39123 EXAMPLES**

39124 In a directory with three SCCS files, **s.x** (of **t** type "text"), **s.y**, and **s.z** (a corrupted file), the  
39125 following command could produce the output shown:

```
39126 val - <<EOF
39127 -y source s.x
39128 -m y s.y
39129 s.z
39130 EOF

39131 -y source s.x

39132 s.x: %Y%, -y mismatch
39133 s.z

39134 s.z: corrupted SCCS file
```

**39135 RATIONALE**

39136 None.

**39137 FUTURE DIRECTIONS**

39138 None.

**39139 SEE ALSO**

39140 *admin, delta, get, prs*

**39141 CHANGE HISTORY**

39142 First released in Issue 2.

**39143 Issue 4**

39144 Format reorganized.

39145 Exceptions to Utility Syntax Guidelines conformance noted.

39146 Internationalized environment variable support mandated.

**39147 Issue 6**

39148 The Open Group corrigenda item U025/4 has been applied, correcting a typographical error in  
39149 the EXIT STATUS.

## 39150 NAME

39151 vi — screen-oriented (visual) display editor

## 39152 SYNOPSIS

39153 UP `vi [-rR][-l][-c command][-t tagstring][-w size][file ...]`

39154

## 39155 DESCRIPTION

39156 **Notes to Reviewers**39157 *This section with side shading will not appear in the final copy. - Ed.*

39158 This utility has undergone significant revision due to the 1003.2b merger. The following D1  
 39159 XCU ERNs need to be checked after the merge: 361, 363, 364, 366.

39160 This utility shall be provided on systems that both support the User Portability Utilities option  
 39161 and define the POSIX2\_CHAR\_TERM symbol. On other systems it is optional.

39162 The *vi* (visual) utility is a screen-oriented text editor. Only the open and visual modes of the  
 39163 editor are described in IEEE Std. 1003.1-200x; see the line editor *ex* for additional editing  
 39164 capabilities used in *vi*. The user can switch back and forth between *vi* and *ex* and execute *ex*  
 39165 commands from within *vi*.

39166 This reference page uses the term *edit buffer* to describe the current working text. No specific  
 39167 implementation is implied by this term. All editing changes are performed on the edit buffer,  
 39168 and no changes to it shall affect any file until an editor command writes the file.

39169 When using *vi*, the terminal screen acts as a window into the editing buffer. Changes made to  
 39170 the editing buffer shall be reflected in the screen display; the position of the cursor on the screen  
 39171 shall indicate the position within the editing buffer.

39172 Certain terminals do not have all the capabilities necessary to support the complete *vi* definition.  
 39173 When these commands cannot be supported on such terminals, this condition shall not produce  
 39174 an error message such as “not an editor command” or report a syntax error. The implementation  
 39175 may either accept the commands and produce results on the screen that are the result of an  
 39176 unsuccessful attempt to meet the requirements of this volume of IEEE Std. 1003.1-200x or report  
 39177 an error describing the terminal-related deficiency.

## 39178 OPTIONS

39179 The *vi* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 39180 Section 12.2, Utility Syntax Guidelines.

39181 The following options shall be supported:

39182 **-c *command*** See the *ex* command description of the **-c** option.39183 MAN **-l** (The letter ell.) Set lisp mode; see **Edit Options in ex** on page 425.39184 **-r** See the *ex* command description of the **-r** option.39185 **-R** See the *ex* command description of the **-R** option.39186 **-t *tagstring*** See the *ex* command description of the **-t** option.39187 **-w *size*** See the *ex* command description of the **-w** option.

## 39188 OPERANDS

39189 See the OPERANDS section of the *ex* command for a description of the operands supported by  
 39190 the *vi* command.

**39191 STDIN**

39192 If standard input is not a terminal device, the results are undefined. The standard input consists  
 39193 of a series of commands and input text, as described in the EXTENDED DESCRIPTION section.

39194 If a read from the standard input returns an error, or if the editor detects an end-of-file condition  
 39195 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

**39196 INPUT FILES**

39197 See the INPUT FILES section of the *ex* command for a description of the input files supported by  
 39198 the *vi* command.

**39199 ENVIRONMENT VARIABLES**

39200 See the ENVIRONMENT VARIABLES section of the *ex* command for the environment variables  
 39201 that affect the execution of the *vi* command.

**39202 ASYNCHRONOUS EVENTS**

39203 See the ASYNCHRONOUS EVENTS section of the *ex* for the asynchronous events that affect the  
 39204 execution of the *vi* command.

**39205 STDOUT**

39206 If standard output is not a terminal device, undefined results occur.

39207 Standard output may be used for writing prompts to the user, for informational messages, and  
 39208 for writing lines from the file.

**39209 STDERR**

39210 If standard output is not a terminal device, undefined results occur.

39211 Used only for diagnostic messages.

**39212 OUTPUT FILES**

39213 See the OUTPUT FILES section of the *ex* command for a description of the output files  
 39214 supported by the *vi* command.

**39215 EXTENDED DESCRIPTION**

39216 If the terminal does not have the capabilities necessary to support an unspecified portion of the  
 39217 *vi* definition, implementations shall start initially in *ex* mode or open mode. Otherwise, after  
 39218 initialization, *vi* shall be in command mode; text input mode can be entered by one of several  
 39219 commands used to insert or change text. In text input mode, <ESC> can be used to return to  
 39220 command mode; other uses of <ESC> are described later in this section; see **Terminate**  
 39221 **Command or Input Mode** on page 1039.

**39222 Initialization in *ex* and *vi***

39223 See **Initialization in *ex* and *vi*** on page 392 for a description of *ex* and *vi* initialization for the *vi*  
 39224 utility.

**39225 Command Descriptions in *vi***

39226 The following symbols are used in this reference page to represent arguments to commands.

39227 *buffer* See the description of *buffer* in the EXTENDED DESCRIPTION section of the *ex* utility;  
 39228 see **Command Descriptions in *ex*** on page 401.

39229 In open and visual mode, when a command synopsis shows both [*buffer*] and [*count*]  
 39230 preceding the command name, they can be specified in either order.

39231 *count* A positive integer used as an optional argument to most commands, either to give a  
 39232 repeat count or as a size. This argument is optional and shall default to 1 unless  
 39233 otherwise specified.

The Synopsis lines for the *vi* commands `<control>-G`, `<control>-L`, `<control>-R`, `<control>-]`, `%`, `&`, `^`, `D`, `m`, `M`, `Q`, `u`, `U`, and `ZZ` do not have *count* as an optional argument. Regardless, it shall not be an error to specify a *count* to these commands, and any specified *count* shall be ignored.

***motion*** An optional trailing argument used by the `!`, `<`, `>`, `c`, `d`, and `y` commands, which is used to indicate the region of text that shall be affected by the command. The motion can be either one of the command characters repeated or one of several other *vi* commands (listed in the following table). Each of the applicable commands specifies the region of text matched by repeating the command; each command that can be used as a motion command specifies the region of text it affects.

Commands that take *motion* arguments operate on either lines or characters, depending on the circumstances. When operating on lines, all lines that fall partially or wholly within the text region specified for the command shall be affected. When operating on characters, only the exact characters in the specified text region shall be affected. Each motion command specifies this individually.

When commands that may be motion commands are not used as motion commands, they shall set the current position to the current line and column as specified.

The following commands shall be valid cursor motion commands:

|                                      |                 |                         |
|--------------------------------------|-----------------|-------------------------|
| <code>&lt;control&gt;-H</code>       | <code>;</code>  | <code>'character</code> |
| <code>&lt;newline&gt;</code>         | <code>?</code>  | <code>b</code>          |
| <code>&lt;carriage-return&gt;</code> | <code>B</code>  | <code>e</code>          |
| <code>&lt;control&gt;-N</code>       | <code>E</code>  | <code>f</code>          |
| <code>&lt;control&gt;-P</code>       | <code>F</code>  | <code>h</code>          |
| <code>&lt;space&gt;</code>           | <code>G</code>  | <code>j</code>          |
| <code>\$</code>                      | <code>H</code>  | <code>k</code>          |
| <code>%</code>                       | <code>L</code>  | <code>l</code>          |
| <code>'character</code>              | <code>M</code>  | <code>n</code>          |
| <code>(</code>                       | <code>N</code>  | <code>t</code>          |
| <code>)</code>                       | <code>T</code>  | <code>w</code>          |
| <code>+</code>                       | <code>W</code>  | <code>{</code>          |
| <code>,</code>                       | <code>[[</code> | <code> </code>          |
| <code>-</code>                       | <code>]]</code> | <code>}</code>          |
| <code>/</code>                       | <code>^</code>  | <code>0</code>          |
| <code>_</code>                       |                 |                         |

Any *count* that is specified to a command that has an associated motion command shall be applied to the motion command. If a *count* is applied to both the command and its associated motion command, the effect shall be multiplicative.

The following symbol is used in this section to specify locations in the edit buffer:

***current character***

The character that is currently displayed by the cursor.

The following symbols are used in this section to specify command actions:

***bigword*** In the POSIX locale, *vi* shall recognize four kinds of *bigwords*:

1. A maximal sequence of non-`<blank>` characters preceded and followed by `<blank>` characters or the beginning or end of a line or the edit buffer
2. One or more sequential empty or `<blank>` character-filled lines

|       |                                    |                                                                                                |  |
|-------|------------------------------------|------------------------------------------------------------------------------------------------|--|
| 39279 |                                    | 3. The first character in the edit buffer                                                      |  |
| 39280 |                                    | 4. The last character in the edit buffer                                                       |  |
| 39281 | <i>word</i>                        | In the POSIX locale, <i>vi</i> shall recognize five kinds of words:                            |  |
| 39282 |                                    | 1. A maximal sequence of letters, digits, and underscores, delimited at both ends by:          |  |
| 39283 |                                    | — Characters other than letters, digits, or underscores                                        |  |
| 39284 |                                    | — The beginning or end of a line                                                               |  |
| 39285 |                                    | — The beginning or end of the edit buffer                                                      |  |
| 39286 |                                    | 2. A maximal sequence of characters other than letters, digits, underscores, or                |  |
| 39287 |                                    | <blank> characters, delimited at both ends by:                                                 |  |
| 39288 |                                    | — A letter, digit, underscore                                                                  |  |
| 39289 |                                    | — <blank> characters                                                                           |  |
| 39290 |                                    | — The beginning or end of a line                                                               |  |
| 39291 |                                    | — The beginning or end of the edit buffer                                                      |  |
| 39292 |                                    | 3. One or more sequential empty or <blank> character-filled lines                              |  |
| 39293 |                                    | 4. The first character in the edit buffer                                                      |  |
| 39294 |                                    | 5. The last character in the edit buffer                                                       |  |
| 39295 | <i>section boundary</i>            |                                                                                                |  |
| 39296 |                                    | A <i>section boundary</i> is one of the following:                                             |  |
| 39297 |                                    | 1. A line whose first character is a <form-feed> character                                     |  |
| 39298 |                                    | 2. A line whose first character is an open curly brace ( ' { ' )                               |  |
| 39299 |                                    | 3. A line whose first character is a period and whose second and third characters              |  |
| 39300 |                                    | match a two-character pair in the <b>sections</b> edit option (see <i>ed</i> )                 |  |
| 39301 |                                    | 4. A line whose first character is a period and whose only other character matches             |  |
| 39302 |                                    | the first character of a two-character pair in the <b>sections</b> edit option, where the      |  |
| 39303 |                                    | second character of the two-character pair is a <space> character                              |  |
| 39304 |                                    | 5. The first line of the edit buffer                                                           |  |
| 39305 |                                    | 6. The last line of the edit buffer if the last line of the edit buffer is empty or if it is a |  |
| 39306 |                                    | ]] or } command; otherwise, the last character of the last line of the edit buffer             |  |
| 39307 | <i>paragraph boundary</i>          |                                                                                                |  |
| 39308 |                                    | A <i>paragraph boundary</i> is one of the following:                                           |  |
| 39309 |                                    | 1. A section boundary                                                                          |  |
| 39310 |                                    | 2. A line whose first character is a period and whose second and third characters              |  |
| 39311 |                                    | match a two-character pair in the <b>paragraphs</b> edit option (see <i>ed</i> )               |  |
| 39312 |                                    | 3. A line whose first character is a period and whose only other character matches             |  |
| 39313 |                                    | the first character of a two-character pair in the <i>paragraphs</i> edit option, where the    |  |
| 39314 |                                    | second character of the two-character pair is a <space> character                              |  |
| 39315 |                                    | 4. One or more sequential empty or <blank> character-filled lines                              |  |
| 39316 | <i>remembered search direction</i> |                                                                                                |  |
| 39317 |                                    | See the description of remembered search direction in <i>ed</i> .                              |  |

|       |                                                                                                               |  |
|-------|---------------------------------------------------------------------------------------------------------------|--|
| 39318 | <i>sentence boundary</i>                                                                                      |  |
| 39319 | A <i>sentence boundary</i> is one of the following:                                                           |  |
| 39320 | 1. A paragraph boundary                                                                                       |  |
| 39321 | 2. The first non-<blank> character that occurs after a paragraph boundary                                     |  |
| 39322 | 3. The first non-<blank> character that occurs after a period ( ' . ' ), exclamation                          |  |
| 39323 | point ( ' ! ' ), or question mark ( ' ? ' ), followed by two <space> characters or the                        |  |
| 39324 | end of a line; any number of closing parenthesis ( ' ) ' ), closing brackets ( ' ] ' ),                       |  |
| 39325 | double quote ( ' " ' ), ' or single quote ( ' ' ' ) characters can appear between the                         |  |
| 39326 | punctuation mark and the two <space> characters or end-of-line                                                |  |
| 39327 | Any lines displayed on the screen that logically represent lines after the last line in the edit buffer       |  |
| 39328 | shall consist of a single tilde ( ' ~ ' ) character.                                                          |  |
| 39329 | The last line of the screen shall be used to report errors or display informational messages. It              |  |
| 39330 | shall also be used to display the input for "line-oriented commands" ( / , ? , : , and ! ). When a line-      |  |
| 39331 | oriented command is executed, the editor shall enter text input mode on the last line on the                  |  |
| 39332 | screen, using the respective command characters as prompt characters. (In the case of the !                   |  |
| 39333 | command, the associated motion shall be entered by the user before the editor enters text input               |  |
| 39334 | mode.) The line entered by the user shall be terminated by a character, a non-<control>-V-                    |  |
| 39335 | escaped <carriage-return> character, or unescaped <ESC>. It is unspecified if more characters                 |  |
| 39336 | than require a display width minus one column number of screen columns can be entered.                        |  |
| 39337 | If any command is executed that overwrites a portion of the screen other than the last line of the            |  |
| 39338 | screen (for example, the <b>ex suspend</b> , or ! commands), other than the <b>ex shell</b> command, the user |  |
| 39339 | shall be prompted for a character before the screen is refreshed and the edit session continued.              |  |
| 39340 | <tab> characters shall take up the number of columns on the screen set by the <b>tabstop</b> edit             |  |
| 39341 | option (see <b>ed</b> ), unless there are less than that number of columns before the display margin that     |  |
| 39342 | will cause the displayed line to be folded; in this case, they shall only take up the number of               |  |
| 39343 | columns up to that boundary.                                                                                  |  |
| 39344 | The cursor shall be placed on the current line and relative to the current column as specified by             |  |
| 39345 | each command described in the following sections.                                                             |  |
| 39346 | In open mode, if the current line is not already displayed, then it shall be displayed.                       |  |
| 39347 | In visual mode, if the current line is not displayed, then the lines that are displayed shall be              |  |
| 39348 | expanded, scrolled, or redrawn to cause an unspecified portion of the current line to be                      |  |
| 39349 | displayed. If the screen is redrawn, no more than the number of logical lines specified by the                |  |
| 39350 | value of the <b>window</b> edit option shall be displayed (unless the current line cannot be completely       |  |
| 39351 | displayed in the number of logical lines specified by the <b>window</b> edit option) and the current          |  |
| 39352 | line shall be positioned as close to the center of the displayed lines as possible (within the                |  |
| 39353 | constraints imposed by the distance of the line from the beginning or end of the edit buffer). If             |  |
| 39354 | the current line is before the first line in the display and the screen is scrolled, an unspecified           |  |
| 39355 | portion of the current line shall be placed on the first line of the display. If the current line is after    |  |
| 39356 | the last line in the display and the screen is scrolled, an unspecified portion of the current line           |  |
| 39357 | shall be placed on the last line of the display.                                                              |  |
| 39358 | In visual mode, if a line from the edit buffer (other than the current line) does not entirely fit into       |  |
| 39359 | the lines at the bottom of the display that are available for its presentation, the editor may                |  |
| 39360 | choose not to display any portion of the line. The lines of the display that do not contain text              |  |
| 39361 | from the edit buffer for this reason shall each consist of a single ' @ ' character.                          |  |
| 39362 | In visual mode, the editor may choose for unspecified reasons to not update lines in the display              |  |
| 39363 | to correspond to the underlying edit buffer text. The lines of the display that do not correctly              |  |

39364 correspond to text from the edit buffer for this reason shall consist of a single '@' character, and  
 39365 the <control>-R command shall cause the editor to update the screen to correctly represent the  
 39366 edit buffer.

39367 Open and visual mode commands that set the current column set it to a column position in the  
 39368 display, and not a character position in the line. In this case, however, the column position in the  
 39369 display shall be calculated for a infinite width display; for example, the column related to a  
 39370 character that is part of a line that has been folded onto additional screen lines will be offset from  
 39371 the screen column where the physical line begins, not from the beginning of a particular screen  
 39372 line.

39373 The physical cursor column in the display is based on the value of the current column, as  
 39374 follows, with each rule applied in turn:

- 39375 1. If the current column is after the last screen column used by the displayed line, the  
 39376 physical cursor column shall be set to the last screen column occupied by the last character  
 39377 in the current line; otherwise, the physical cursor column shall be set to the current  
 39378 column.
- 39379 2. If the character of which some portion is displayed in the screen column specified by the  
 39380 physical cursor column requires more than a single screen column:
  - 39381 a. If in text input mode, the physical cursor column shall be adjusted to the first screen  
 39382 column in which any portion of that character is displayed.
  - 39383 b. Otherwise, the physical cursor column shall be adjusted to the last screen column in  
 39384 which any portion of that character is displayed.

39385 The current column shall not be changed by these adjustments to the physical cursor column.

39386 If an error occurs during the parsing or execution of a *vi* command:

- 39387 • The terminal shall be alerted. Execution of the *vi* command shall stop, and the cursor (for  
 39388 example, the current line and column) shall not be further modified.
- 39389 • Unless otherwise specified by the following command sections, it is unspecified whether an  
 39390 informational message shall be displayed.
- 39391 • Any partially entered *vi* command shall be discarded.
- 39392 • If the *vi* command resulted from a **map** expansion, all characters from that **map** expansion  
 39393 shall be discarded, except as otherwise specified by the **map** command (see *ed*).
- 39394 • If the *vi* command resulted from the execution of a buffer, no further commands caused by  
 39395 the execution of the buffer shall be executed.

## 39396 Page Backwards

39397 *Synopsis:*     [*count*] <control>-B

39398 If in open mode, the <control>-B command shall behave identically to the **z** command.  
 39399 Otherwise, if the current line is the first line of the edit buffer, it shall be an error.

39400 If the **window** edit option is less than 3, display a screen where the last line of the display shall  
 39401 be some portion of:

39402 (*current first line*) -1

39403 otherwise, display a screen where the first line of the display shall be some portion of:

39404 (*current first line*) -*count* W ((*window edit option*) -2)

39405 If this calculation would result in a line that is before the first line of the edit buffer, the first line  
 39406 of the display shall display some portion of the first line of the edit buffer.

39407 *Current line:* If no lines from the previous display remain on the screen, set to the last line of the  
 39408 display; otherwise, set to (*line* – the number of new lines displayed on this screen).

39409 *Current column:* Set to non-<blank>.

### 39410 **Scroll Forward**

39411 *Synopsis:* [ *count* ] <control>-D

39412 If the current line is the last line of the edit buffer, it shall be an error.

39413 If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D  
 39414 or <control>-U command. If there was no previous <control>-D or <control>-U command, *count*  
 39415 shall default to the value of the **scroll** edit option.

39416 If in open mode, write lines starting with the line after the current line, until *count* lines or the  
 39417 last line of the file have been written.

39418 *Current line:* If the current line + *count* is past the last line of the edit buffer, set to the last line of  
 39419 the edit buffer; otherwise, set to the current line + *count*.

39420 *Current column:* Set to non-<blank>.

### 39421 **Scroll Forward by Line**

39422 *Synopsis:* [ *count* ] <control>-E

39423 Display the line count lines after the last line currently displayed.

39424 If the last line of the edit buffer is displayed, it shall be an error. If there is no line *count* lines  
 39425 after the last line currently displayed, the last line of the display shall display some portion of  
 39426 the last line of the edit buffer.

39427 *Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first  
 39428 line displayed.

39429 *Current column:* Unchanged.

### 39430 **Page Forward**

39431 *Synopsis:* [ *count* ] <control>-F

39432 If in open mode, the <control>-F command shall behave identically to the **z** command.  
 39433 Otherwise, if the current line is the last line of the edit buffer, it shall be an error.

39434 If the **window** edit option is less than 3, display a screen where the first line of the display shall  
 39435 be some portion of:

39436 (*current last line*) +1

39437 otherwise, display a screen where the first line of the display shall be some portion of:

39438 (*current first line*) + *count* W ((window edit option) -2)

39439 If this calculation would result in a line that is after the last line of the edit buffer, the last line of  
 39440 the display shall display some portion of the last line of the edit buffer.

39441 *Current line:* If no lines from the previous display remain on the screen, set to the first line of the  
 39442 display; otherwise, set to (*line* + the number of new lines displayed on this screen).

|       |                                                                                                                  |  |

| 39471 | If used as a motion command:                                                                                     |  |
| 39472 | 1. The text region shall include the starting line and the next <i>count</i> – 1 lines.                          |  |
| 39473 | 2. Any text copied to a buffer shall be in line mode.                                                            |  |
| 39474 | If not used as a motion command:                                                                                 |  |
| 39475 | <i>Current line:</i> Set to <i>current line</i> + <i>count</i> .                                                 |  |
| 39476 | <i>Current column:</i> Set to non-<blank> for the <carriage-return> character, <control>-M, and +                |  |
| 39477 | commands; otherwise, unchanged.                                                                                  |  |

### 39478 **Clear and Redisplay**

39479 *Synopsis:*      <control>-L

39480 If in open mode, clear the screen and redisplay the current line. Otherwise, clear and redisplay  
39481 the screen.

39482 *Current line:* Unchanged.

39483 *Current column:* Unchanged.

### 39484 **Move Up**

39485 *Synopsis:*      [*count*] <control>-P

39486                    [*count*] k

39487                    [*count*] -

39488 If there are less than *count* lines before the current line in the edit buffer, it shall be an error.

39489 If used as a motion command:

39490      1. The text region shall include the starting line and the previous *count* lines.

39491      2. Any text copied to a buffer shall be in line mode.

39492 If not used as a motion command:

39493 *Current line:* Set to *current line* - *count*.

39494 *Current column:* Set to non-<blank> for the - command; otherwise, unchanged.

### 39495 **Redraw Screen**

39496 *Synopsis:*      <control>-R

39497 If any lines have been deleted from the logical screen and flagged as deleted on the terminal  
39498 using the @ convention (see the beginning of the EXTENDED DESCRIPTION section), they shall  
39499 be redisplayed to match the contents of the edit buffer.

39500 It is unspecified whether lines flagged with @ because they do not fit on the terminal display  
39501 shall be affected.

39502 *Current line:* Unchanged.

39503 *Current column:* Unchanged.

### 39504 **Scroll Backward**

39505 *Synopsis:*      [*count*] <control>-U

39506 If the current line is the first line of the edit buffer, it shall be an error.

39507 If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D  
39508 or <control>-U command. If there was no previous <control>-D or <control>-U command, *count*  
39509 shall default to the value of the **scroll** edit option.

39510 *Current line:* If *count* is greater than the current line, set to 1; otherwise, set to the current line -  
39511 *count*.

39512 *Current column:* Set to non-<blank>.

### 39513 **Scroll Backward by Line**

39514 *Synopsis:*     [*count*] <control>-Y

39515 Display the line *count* lines before the first line currently displayed.

39516 If the current line is the first line of the edit buffer, it shall be an error. If this calculation would  
39517 result in a line that is before the first line of the edit buffer, the first line of the display shall  
39518 display some portion of the first line of the edit buffer.

39519 *Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first  
39520 line displayed.

39521 *Current column:* Unchanged.

### 39522 **Edit the Alternate File**

39523 *Synopsis:*     <control>-^

39524 This command shall be equivalent to the *ex* **edit** command, with the alternate path name as its  
39525 argument.

### 39526 **Terminate Command or Input Mode**

39527 *Synopsis:*     <ESC>

39528 If a partial *vi* command (as defined by at least one, non-*count* character) has been entered,  
39529 discard the *count* and the command character(s).

39530 Otherwise, if no command characters have been entered, and the <ESC> was the result of a map  
39531 expansion, the terminal shall be alerted and the <ESC> character shall be discarded, but it shall  
39532 not be an error.

39533 Otherwise, it shall be an error.

39534 *Current line:* Unchanged.

39535 *Current column:* Unchanged.

### 39536 **Search for tagstring**

39537 *Synopsis:*     <control>-]

39538 If the current character is not a word or <blank> character, it shall be an error.

39539 This command shall be equivalent to the *ex* **tag** command, with the argument to that command  
39540 defined as follows.

39541 If the current character is a <blank> character:

- 39542     1. Skip all <blank> characters after the cursor up to the end of the line.
- 39543     2. If the end of the line is reached, it shall be an error.

39544 Then, the argument to the *ex* **tag** command shall be the current character and all subsequent  
39545 characters, up to the first non-word character or the end of the line.

**Move Cursor Forward**

*Synopsis:*     [ *count* ] <space>  
                   [ *count* ] 1 (ell)

If there are less than *count* characters after the cursor on the current line, *count* shall be adjusted to the number of characters after the cursor on the line.

If used as a motion command:

1. If the current or *count*th character after the cursor is the last character in the line, the text region shall be comprised of the current character up to and including the last character in the line. Otherwise, the text region shall be from the current character up to, but not including, the *count*th character after the cursor.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

If there are no characters after the current character on the current line, it shall be an error.

*Current line:* Unchanged.

*Current column:* Set to the last column that displays any portion of the *count*th character after the current character.

**Replace Text with Results from Shell Command**

*Synopsis:*     [ *count* ] ! *motion shell-commands* <newline>

If the motion command is the ! command repeated:

1. If the edit buffer is empty and no *count* was supplied, the command shall be the equivalent of the *ex:read!* command, with the text input, and no text shall be copied to any buffer.
2. Otherwise:
  - a. If there are less than *count* – 1 lines after the current line in the edit buffer, it shall be an error.
  - b. The text region shall be from the current line up to and including the next *count* – 1 lines.

Otherwise, the text region shall be the lines in which any character of the text region specified by the motion command appear.

Any text copied to a buffer shall be in line mode.

This command shall be equivalent to the *ex!* command for the specified lines.

**Move Cursor to End-of-line**

*Synopsis:*     [ *count* ] \$

It shall be an error if there are less than (*count* – 1) lines after the current line in the edit buffer.

If used as a motion command:

1. If *count* is 1:
  - a. It shall be an error if the line is empty.
  - b. Otherwise, the text region shall consist of all characters from the starting cursor to the last character in the line, inclusive, and any text copied to a buffer shall be in

|       |                                                                                                          |  |
|-------|----------------------------------------------------------------------------------------------------------|--|
| 39584 | character mode.                                                                                          |  |
| 39585 | 2. Otherwise, if the starting cursor position is at or before the first non-<blank> character in         |  |
| 39586 | the line, the text region shall consist of the current and the next <i>count</i> -1 lines, and any text  |  |
| 39587 | saved to a buffer shall be in line mode.                                                                 |  |
| 39588 | 3. Otherwise, the text region shall consist of all characters from the starting cursor to the last       |  |
| 39589 | character in the line that is <i>count</i> -1 lines forward from the current line, and any text copied   |  |
| 39590 | to a buffer shall be in character mode.                                                                  |  |
| 39591 | If not used as a motion command:                                                                         |  |
| 39592 | <i>Current line</i> : Set to the <i>current line</i> + <i>count</i> -1.                                  |  |
| 39593 | <i>Current column</i> : The current column is set to the last screen column of the last character in the |  |
| 39594 | line, or column position 1 if the line is empty.                                                         |  |
| 39595 | The current column shall be adjusted to be on the last screen column of the last character of the        |  |
| 39596 | current line as subsequent commands change the current line, until a command changes the                 |  |
| 39597 | current column.                                                                                          |  |
| 39598 | <b>Move to Matching Character</b>                                                                        |  |
| 39599 | <i>Synopsis</i> :      %                                                                                 |  |
| 39600 | If the character at the current position is not a parenthesis, bracket, or curly brace, search           |  |
| 39601 | forwards in the line to the first one of those characters. If no such character is found, it shall be    |  |
| 39602 | an error.                                                                                                |  |
| 39603 | The matching character shall be the parenthesis, bracket, or curly brace matching the                    |  |
| 39604 | parenthesis, bracket, or curly brace, respectively, that was at the current position or that was         |  |
| 39605 | found on the current line.                                                                               |  |
| 39606 | Matching shall be determined as follows, for an open parenthesis:                                        |  |
| 39607 | 1. Set a counter to 1.                                                                                   |  |
| 39608 | 2. Search forwards until a parenthesis is found or the end of the edit buffer is reached.                |  |
| 39609 | 3. If the end of the edit buffer is reached, it shall be an error.                                       |  |
| 39610 | 4. If an open parenthesis is found, increment the counter by 1.                                          |  |
| 39611 | 5. If a close parenthesis is found, decrement the counter by 1.                                          |  |
| 39612 | 6. If the counter is zero, the current character is the matching character.                              |  |
| 39613 | Matching for a close parenthesis shall be equivalent, except that the search shall be backwards,         |  |
| 39614 | from the starting character to the beginning of the buffer, a close parenthesis shall increment the      |  |
| 39615 | counter by 1, and an open parenthesis shall decrement the counter by 1.                                  |  |
| 39616 | Matching for brackets and curly braces shall be equivalent, except that searching shall be done          |  |
| 39617 | for open and close brackets or open and close curly braces. It is implementation-dependent               |  |
| 39618 | whether other characters are searched for and matched as well.                                           |  |
| 39619 | If used as a motion command:                                                                             |  |
| 39620 | 1. If the matching cursor was after the starting cursor in the edit buffer, and the starting             |  |
| 39621 | cursor position was at or before the first non-<blank> character in the starting line, and the           |  |
| 39622 | matching cursor position was at or after the last non-<blank> character in the matching                  |  |
| 39623 | line, the text region shall consist of the current line to the matching line, inclusive, and any         |  |
| 39624 | text copied to a buffer shall be in line mode.                                                           |  |

39625 2. If the matching cursor was before the starting cursor in the edit buffer, and the starting  
 39626 cursor position was at or after the last non-<blank> character in the starting line, and the  
 39627 matching cursor position was at or before the first non-<blank> character in the matching  
 39628 line, the text region shall consist of the current line to the matching line, inclusive, and any  
 39629 text copied to a buffer shall be in line mode.

39630 3. Otherwise, the text region shall consist of the starting character to the matching character,  
 39631 inclusive, and any text copied to a buffer shall be in character mode.

39632 If not used as a motion command:

39633 *Current line*: Set to the line where the matching character is located.

39634 *Current column*: Set to the last column where any portion of the matching character is displayed.

### 39635 **Repeat Substitution**

39636 *Synopsis*:        &

39637 Repeat the previous substitution command. This command shall be equivalent to the *ex &*  
 39638 command with the current line as its addresses, and without *options*, *count*, or *flags*.

### 39639 **Return to Previous Context at Beginning of Line**

39640 *Synopsis*:        ' *character*

39641 It shall be an error if there is no line in the edit buffer marked by *character*.

39642 If used as a motion command:

39643 1. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
 39644 and the marked cursor in the edit buffer shall be logically swapped.

39645 2. The text region shall consist of the starting line up to and including the marked line, and  
 39646 any text copied to a buffer shall be in line mode.

39647 If not used as a motion command:

39648 *Current line*: Set to the line referenced by the mark.

39649 *Current column*: Set to non-<blank>.

### 39650 **Return to Previous Context**

39651 *Synopsis*:        ` *character*

39652 It shall be an error if the marked line is no longer in the edit buffer. If the marked line no longer  
 39653 contains a character in the saved numbered character position, it shall be as if the marked  
 39654 position is the first non-<blank> character.

39655 If used as a motion command:

39656 1. It shall be an error if the marked cursor references the same character in the edit buffer as  
 39657 the starting cursor.

39658 2. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
 39659 and the marked cursor in the edit buffer shall be logically swapped.

39660 3. If the starting line is empty or the starting cursor is at or before the first non-<blank>  
 39661 character of the starting line, and the marked cursor line is empty or the marked cursor  
 39662 references the first character of the marked cursor line, the text region shall consist of all  
 39663 lines containing characters from the starting cursor to the line before the marked cursor

|       |                                                                                                                  |  |
|-------|------------------------------------------------------------------------------------------------------------------|--|
| 39664 | line, inclusive, and any text copied to a buffer shall be in line mode.                                          |  |
| 39665 | 4. Otherwise, if the marked cursor line is empty or the marked cursor references a character                     |  |
| 39666 | at or before the first non-<blank> character of the marked cursor line, the region of text                       |  |
| 39667 | shall be from the starting cursor to the last character of the line before the marked cursor                     |  |
| 39668 | line, inclusive, and any text copied to a buffer shall be in character mode.                                     |  |
| 39669 | 5. Otherwise, the region of text shall be from the starting cursor (inclusive), to the marked                    |  |
| 39670 | cursor (exclusive), and any text copied to a buffer shall be in character mode.                                  |  |
| 39671 | If not used as a motion command:                                                                                 |  |
| 39672 | <i>Current line</i> : Set to the line referenced by the mark.                                                    |  |
| 39673 | <i>Current column</i> : Set to the last column in which any portion of the character referenced by the           |  |
| 39674 | mark is displayed.                                                                                               |  |
| 39675 | <b>Return to Previous Section</b>                                                                                |  |
| 39676 | <i>Synopsis:</i> [ [                                                                                             |  |
| 39677 | Move the cursor backward through the edit buffer to the first character of the previous section                  |  |
| 39678 | boundary, <i>count</i> times.                                                                                    |  |
| 39679 | If used as a motion command:                                                                                     |  |
| 39680 | 1. If the starting cursor was at the first character of the starting line or the starting line was               |  |
| 39681 | empty, and the first character of the boundary was the first character of the boundary line,                     |  |
| 39682 | the text region shall consist of the current line up to and including the line where the                         |  |
| 39683 | <i>countth</i> next boundary starts, and any text copied to a buffer shall be in line mode.                      |  |
| 39684 | 2. If the boundary was the last line of the edit buffer or the last character of the last line of the            |  |
| 39685 | edit buffer, the text region shall consist of the last character in the edit buffer up to and                    |  |
| 39686 | including the starting character, and any text saved to a buffer shall be in character mode.                     |  |
| 39687 | 3. Otherwise, the text region shall consist of the starting character up to but not including the                |  |
| 39688 | first character in the <i>countth</i> next boundary, and any text copied to a buffer shall be in                 |  |
| 39689 | character mode.                                                                                                  |  |
| 39690 | MAN If the <i>lisp</i> option is set, a section boundary is also identified by a line with a leading ' ( '.      |  |
| 39691 | If not used as a motion command:                                                                                 |  |
| 39692 | <i>Current line</i> : Set to the line where the <i>countth</i> next boundary in the edit buffer starts.          |  |
| 39693 | <i>Current column</i> : Set to the last column in which any portion of the first character of the <i>countth</i> |  |
| 39694 | next boundary is displayed, or column position 1 if the line is empty.                                           |  |
| 39695 | <b>Move to Next Section</b>                                                                                      |  |
| 39696 | <i>Synopsis:</i> ] ]                                                                                             |  |
| 39697 | Move the cursor forward through the edit buffer to the first character of the next section                       |  |
| 39698 | boundary, <i>count</i> times.                                                                                    |  |
| 39699 | If used as a motion command:                                                                                     |  |
| 39700 | 1. If the starting cursor was at the first character of the starting line or the starting line was               |  |
| 39701 | empty, and the first character of the boundary was the first character of the boundary line,                     |  |
| 39702 | the text region shall consist of the current line up to and including the line where the                         |  |
| 39703 | <i>countth</i> previous boundary starts, and any text copied to a buffer shall be in line mode.                  |  |

|       |     |                                                                                                                   |
|-------|-----|-------------------------------------------------------------------------------------------------------------------|
| 39704 | 2.  | If the boundary was the first line of the edit buffer, the text region shall consist of the first                 |
| 39705 |     | character in the edit buffer up to but not including the starting character, and any text                         |
| 39706 |     | copied to a buffer shall be in character mode.                                                                    |
| 39707 | 3.  | Otherwise, the text region shall consist of the first character in the <i>count</i> th previous section           |
| 39708 |     | boundary up to but not including the starting character, and any text copied to a buffer                          |
| 39709 |     | shall be in character mode.                                                                                       |
| 39710 | MAN | If the <i>lisp</i> option is set, a section boundary is also identified by a line with a leading ' ( ' .          |
| 39711 |     | If not used as a motion command:                                                                                  |
| 39712 |     | <i>Current line</i> : Set to the line where the <i>count</i> th previous boundary in the edit buffer starts.      |
| 39713 |     | <i>Current column</i> : Set to the last column in which any portion of the first character of the <i>count</i> th |
| 39714 |     | previous boundary is displayed, or column position 1 if the line is empty.                                        |
| 39715 |     | <b>Move to First Non-&lt;blank&gt; Position on Current Line</b>                                                   |
| 39716 |     | <i>Synopsis</i> :     ^                                                                                           |
| 39717 |     | If used as a motion command:                                                                                      |
| 39718 | 1.  | If the line has no non-<blank> characters, or if the cursor is at the first non-<blank>                           |
| 39719 |     | character of the line, it shall be an error.                                                                      |
| 39720 | 2.  | If the cursor is before the first non-<blank> character of the line, the text region shall be                     |
| 39721 |     | comprised of the current character, up to, but not including, the first non-<blank>                               |
| 39722 |     | character of the line.                                                                                            |
| 39723 | 3.  | If the cursor is after the first non-<blank> character of the line, the text region shall be from                 |
| 39724 |     | the character before the starting cursor up to and including the first non-<blank> character                      |
| 39725 |     | of the line.                                                                                                      |
| 39726 | 4.  | Any text copied to a buffer shall be in character mode.                                                           |
| 39727 |     | If not used as a motion command:                                                                                  |
| 39728 |     | <i>Current line</i> : Unchanged.                                                                                  |
| 39729 |     | <i>Current column</i> : Set to non-<blank>.                                                                       |
| 39730 |     | <b>Current and line above</b>                                                                                     |
| 39731 |     | <i>Synopsis</i> :     [ <i>count</i> ] _                                                                          |
| 39732 |     | If there are less than <i>count</i> – 1 lines after the current line in the edit buffer, it shall be an error.    |
| 39733 |     | If used as a motion command:                                                                                      |
| 39734 | 1.  | If <i>count</i> is less than 2, the text region shall be the current line.                                        |
| 39735 | 2.  | Otherwise, the text region shall include the starting line and the next <i>count</i> – 1 lines.                   |
| 39736 | 3.  | Any text copied to a buffer shall be in line mode.                                                                |
| 39737 |     | If not used as a motion command:                                                                                  |
| 39738 |     | <i>Current line</i> : Set to current line + <i>count</i> – 1.                                                     |
| 39739 |     | <i>Current column</i> : Set to non-<blank>.                                                                       |

### 39740 **Move Back to Beginning of Sentence**

39741 *Synopsis:*     [ *count* ] (

39742     Move backward to the beginning of a sentence. This command shall be equivalent to the `[]`  
39743     command, with the exception that sentence boundaries shall be used instead of section  
39744     boundaries.

39745 MAN     If the *lisp* option is set, a *lisp* s-expression is considered a sentence for this command.

### 39746 **Move Forward to Beginning of Sentence**

39747 *Synopsis:*     [ *count* ] )

39748     Move forward to the beginning of a sentence. This command shall be equivalent to the `]]`  
39749     command, with the exception that sentence boundaries shall be used instead of section  
39750     boundaries.

39751 MAN     If the *lisp* option is set, a *lisp* s-expression is considered a sentence for this command.

### 39752 **Move Back to Preceding Paragraph**

39753 *Synopsis:*     [ *count* ] {

39754     Move back to the beginning of the preceding paragraph. This command shall be equivalent to  
39755     the `[]` command, with the exception that paragraph boundaries shall be used instead of section  
39756     boundaries.

### 39757 **Move Forward to Next Paragraph**

39758 *Synopsis:*     [ *count* ] }

39759     Move forward to the beginning of the next paragraph. This command shall be equivalent to the  
39760     `]]` command, with the exception that paragraph boundaries shall be used instead of section  
39761     boundaries.

### 39762 **Move to Specific Column Position**

39763 *Synopsis:*     [ *count* ] |

39764     For the purposes of this command, lines that are too long for the current display and that have  
39765     been folded shall be treated as having a single, 1-based, number of columns.

39766     If there are less than *count* columns in which characters from the current line are displayed on  
39767     the screen, *count* shall be adjusted to be the last column in which any portion of the line is  
39768     displayed on the screen.

39769     If used as a motion character:

- 39770         1. If the line is empty, or the cursor character is the same as the character on the *count*th  
39771         column of the line, it shall be an error.
- 39772         2. If the cursor is before the *count*th column of the line, the text region shall be comprised of  
39773         the current character, up to but not including the character on the *count*th column of the  
39774         line.
- 39775         3. If the cursor is after the *count*th column of the line, the text region shall be from the  
39776         character before the starting cursor up to and including the character on the *count*th  
39777         column of the line.

39778 4. Any text copied to a buffer shall be in character mode.  
 39779 If not used as a motion character:  
 39780 *Current line*: Unchanged.  
 39781 *Current column*: Set to the last column in which any portion of the character that is displayed in  
 39782 the *count* column of the line is displayed.

### 39783 **Reverse Find Character**

39784 *Synopsis*: [ *count* ] ,  
 39785 If the last **F**, **f**, **T**, or **t** command was **F**, **f**, **T**, or **t**, this command shall be equivalent to an **f**, **F**, **t**, or  
 39786 **T** command, respectively, with the specified *count* and the same search character.  
 39787 If there was no previous **F**, **f**, **T**, or **t** command, it shall be an error.

### 39788 **Repeat**

39789 *Synopsis*: [ *count* ] .  
 39790 Repeat the last **!**, **<**, **>**, **A**, **C**, **D**, **I**, **J**, **O**, **P**, **R**, **S**, **X**, **Y**, **a**, **c**, **d**, **i**, **o**, **p**, **r**, **s**, **x**, **y**, or **~** command. It shall  
 39791 be an error if none of these commands have been executed. Commands (other than commands  
 39792 that enter text input mode) executed as a result of map expansions, shall not change the value of  
 39793 the last repeatable command.  
 39794 Repeated commands with associated motion commands shall repeat the motion command as  
 39795 well; however, any specified *count* shall replace the *count*(s) that were originally specified to the  
 39796 repeated command or its associated motion command.  
 39797 If the motion component of the repeated command is **f**, **F**, **t**, or **T**, the repeated command shall  
 39798 not set the remembered search character for the **;** and **,** commands.  
 39799 If the repeated command is **p** or **P**, and the buffer associated with that command was a numeric  
 39800 buffer named with a number less than 9, the buffer associated with the repeated command shall  
 39801 be set to be the buffer named by the name of the previous buffer logically incremented by 1.  
 39802 If the repeated character is a text input command, the input text associated with that command  
 39803 is repeated literally:  
 39804 • Input characters are neither macro or abbreviation-expanded.  
 39805 • Input characters are not interpreted in any special way with the exception that the <newline>  
 39806 character and the <carriage-return> character, and <control>-T behave as described in **Input**  
 39807 **Mode Commands in vi** on page 1064.  
 39808 *Current line*: Set as described for the repeated command.  
 39809 *Current column*: Set as described for the repeated command.

### 39810 **Find Regular Expression**

39811 *Synopsis*: /  
 39812 If the input line contains no characters, it shall be equivalent to a line containing only the last  
 39813 regular expression encountered. The enhanced regular expressions supported by **vi** are  
 39814 described in **Regular Expressions in ex** on page 424.  
 39815 Otherwise, the line shall be interpreted as one or more regular expressions, optionally followed  
 39816 by an address offset or a **vi z** command.

39817 If the regular expression is not the last regular expression on the line, or if a line offset or **z**  
 39818 command is specified, the regular expression shall be terminated by an unescaped `'/'`  
 39819 character, which shall not be used as part of the regular expression. If the regular expression is  
 39820 not the first regular expression on the line, it shall be preceded by zero or more `<blank>`  
 39821 characters, a semicolon, zero or more `<blank>` characters, and a leading `'/'` character, which  
 39822 shall not be interpreted as part of the regular expression. It shall be an error to precede any  
 39823 regular expression with any characters other than these.

39824 Each search shall begin from the character after the first character of the last match (or, if it is the  
 39825 first search, after the cursor). If the **wraps** edit option is set, the search shall continue to the  
 39826 character before the starting cursor character; otherwise, to the end of the edit buffer. It shall be  
 39827 an error if any search fails to find a match, and an informational message to this effect shall be  
 39828 displayed.

39829 An optional address offset (see **Addressing in ex** on page 394) can be specified after the last  
 39830 regular expression by including a trailing `'/'` character after the regular expression and  
 39831 specifying the address offset. This offset will be from the line containing the match for the last  
 39832 regular expression specified. It shall be an error if the line offset would indicate a line address  
 39833 less than 1 or greater than the last line in the edit buffer. An address offset of zero shall be  
 39834 supported. It shall be an error to follow the address offset with any other characters than  
 39835 `<blank>` characters.

39836 If not used as a motion command, an optional **z** command (see **Redraw Window** on page 1063)  
 39837 can be specified after the last regular expression by including a trailing `'/'` character after the  
 39838 regular expression, zero or more `<blank>` characters, a `'z'`, zero or more `<blank>` characters, an  
 39839 optional new **window** edit option value, zero or more `<blank>` characters, and a location  
 39840 character. The effect shall be as if the **z** command was executed after the `/` command. It shall be  
 39841 an error to follow the **z** command with any other characters than `<blank>` characters.

39842 The remembered search direction shall be set to forward.

39843 If used as a motion command:

- 39844 1. It shall be an error if the last match references the same character in the edit buffer as the  
 39845 starting cursor.
- 39846 2. If any address offset is specified, the last match shall be adjusted by the specified offset as  
 39847 described previously.
- 39848 3. If the starting cursor is after the last match, then the locations of the starting cursor and the  
 39849 last match in the edit buffer shall be logically swapped.
- 39850 4. If any address offset is specified, the text region shall consist of all lines containing  
 39851 characters from the starting cursor to the last match line, inclusive, and any text copied to a  
 39852 buffer shall be in line mode.
- 39853 5. Otherwise, if the starting line is empty or the starting cursor is at or before the first non-  
 39854 `<blank>` character of the starting line, and the last match line is empty or the last match  
 39855 starts at the first character of the last match line, the text region shall consist of all lines  
 39856 containing characters from the starting cursor to the line before the last match line,  
 39857 inclusive, and any text copied to a buffer shall be in line mode.
- 39858 6. Otherwise, if the last match line is empty or the last match begins at a character at or  
 39859 before the first non-`<blank>` of the last match line, the region of text shall be from the  
 39860 current cursor to the last character of the line before the last match line, inclusive, and any  
 39861 text copied to a buffer shall be in character mode.

39862 7. Otherwise, the region of text shall be from the current cursor (inclusive), to the first  
 39863 character of the last match (exclusive), and any text copied to a buffer shall be in  
 39864 character mode.

39865 If not used as a motion command:

39866 *Current line*: If a match is found, set to the last matched line plus the address offset, if any;  
 39867 otherwise, unchanged.

39868 *Current column*: Set to the last column on which any portion of the first character in the last  
 39869 matched string is displayed, if a match is found; otherwise, unchanged.

### 39870 **Move to First Character in Line**

39871 *Synopsis*: 0 (zero)

39872 Move to the first character on the current line. The character '0' shall not be interpreted as a  
 39873 command if it is immediately preceded by a digit.

39874 If used as a motion command:

- 39875 1. If the cursor character is the first character in the line, it shall be an error.
- 39876 2. The text region shall be from the character before the cursor character up to and including  
 39877 the first character in the line.
- 39878 3. Any text copied to a buffer shall be in character mode.

39879 If not used as a motion command:

39880 *Current line*: Unchanged.

39881 *Current column*: The last column in which any portion of the first character in the line is  
 39882 displayed, or if the line is empty, unchanged.

### 39883 **Execute an ex Command**

39884 *Synopsis*: :

39885 Execute one or more *ex* commands.

39886 If any portion of the screen other than the last line of the screen was overwritten by any *ex*  
 39887 command (except **shell**), *vi* shall display a message indicating that it is waiting for an input from  
 39888 the user, and shall then read a character. This action may also be taken for other, unspecified  
 39889 reasons.

39890 If the next character entered is a ' : ', another *ex* command shall be accepted and executed. Any  
 39891 other character shall cause the screen to be refreshed and *vi* shall return to command mode.

39892 *Current line*: As specified for the *ex* command.

39893 *Current column*: As specified for the *ex* command.

39894 **Repeat Find**39895 *Synopsis:* [count] ;

39896 This command shall be equivalent to the last **F**, **f**, **T**, or **t** command, with the specified *count*, and  
 39897 with the same search character used for the last **F**, **f**, **T**, or **t** command. If there was no previous **F**,  
 39898 **f**, **T**, or **t** command, it shall be an error.

39899 **Shift Left**39900 *Synopsis:* [count] < motion

39901 If the motion command is the &lt; command repeated:

39902 1. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an  
 39903 error.

39904 2. The text region shall be from the current line, up to and including the next *count* -1 lines.

39905 Shift any line in the text region specified by the *count* and motion command one shiftwidth (see  
 39906 the *ex* **shiftwidth** option) toward the start of the line, as described by the *ex* < command. The  
 39907 unshifted lines shall be copied to the unnamed buffer in line mode.

39908 *Current line:* If the motion was from the current cursor position toward the end of the edit  
 39909 buffer, unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 39910 specified by the motion command.

39911 *Current column:* Set to non-<blank>.39912 **Shift Right**39913 *Synopsis:* [count] > motion

39914 If the motion command is the &gt; command repeated:

39915 1. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an  
 39916 error.

39917 2. The text region shall be from the current line, up to and including the next *count* -1 lines.

39918 Shift any line with characters in the text region specified by the *count* and motion command one  
 39919 shiftwidth (see the *ex* **shiftwidth** option) away from the start of the line, as described by the *ex* >  
 39920 command. The unshifted lines shall be copied into the unnamed buffer in line mode.

39921 *Current line:* If the motion was from the current cursor position toward the end of the edit  
 39922 buffer, unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 39923 specified by the motion command.

39924 *Current column:* Set to non-<blank>.39925 **Scan Backwards for Regular Expression**39926 *Synopsis:* ?

39927 Scan backwards; The ? command shall be equivalent to the / command (see **Find Regular**  
 39928 **Expression** on page 1046) with the following exceptions:

39929 1. The input prompt shall be a ' ? '.

39930 2. Each search shall begin from the character before the first character of the last match (or, if  
 39931 it is the first search, the character before the cursor character).

- 39932 3. The search direction shall be from the cursor toward the beginning of the edit buffer, and  
 39933 the **wraps**can edit option shall affect whether the search wraps to the end of the edit buffer  
 39934 and continues.
- 39935 4. The remembered search direction shall be set to backward.

### 39936 **Execute**

39937 *Synopsis:*     @*buffer*

39938 If the *buffer* is specified as @, the last buffer executed shall be used. If no previous buffer has been  
 39939 executed, it shall be an error.

39940 Behave as if the contents of the named buffer were entered as standard input. After each line of a  
 39941 line-mode buffer, and all but the last line of a character mode buffer, behave as if a <newline>  
 39942 character were entered as standard input.

39943 If an error occurs during this process, an error message shall be written, and no more characters  
 39944 resulting from the execution of this command shall be processed.

39945 If a *count* is specified, behave as if that count were entered as user input before the characters  
 39946 from the @ buffer were entered.

39947 *Current line:* As specified for the individual commands.

39948 *Current column:* As specified for the individual commands.

### 39949 **Reverse Case**

39950 *Synopsis:*     [*count*] ~

39951 Reverse the case of the current character and the next *count* –1 characters, such that lowercase  
 39952 characters that have uppercase counterparts shall be changed to uppercase characters, and  
 39953 uppercase characters that have lowercase counterparts shall be changed to lowercase characters,  
 39954 as prescribed by the current locale. No other characters shall be affected by this command.

39955 If there are less than *count* –1 characters after the cursor in the edit buffer, *count* shall be adjusted  
 39956 to the number of characters after the cursor in the edit buffer minus 1.

39957 For the purposes of this command, the next character after the last character on the line shall be  
 39958 the next character in the edit buffer.

39959 *Current line:* Set to the line including the (*count*–1)th character after the cursor.

39960 *Current column:* Set to the last column in which any portion of the (*count*–1)th character after the  
 39961 cursor is displayed.

### 39962 **Reindent**

39963 MAN *Synopsis:*

39964                   [*count*]=[*motion*]

39965 If the *lisp* option is set, reindents the specified lines, as though they were typed in with **lisp** and  
 39966 **autoindent** set.

39967 *Current line:* Unchanged.

39968 *Current column:* Move to the first non-<blank> character of the line or the last character if the  
 39969 line is a blank line.

39970      **Append**39971      *Synopsis:*      [ *count* ] a

39972      Enter text input mode after the current cursor position. No characters already in the edit buffer  
 39973      shall be affected by this command. A *count* shall cause the input text to be appended *count* -1  
 39974      more times to the end of the input.

39975      *Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi**  
 39976      on page 1064).

39977      **Append at End-of-Line**39978      *Synopsis:*      [ *count* ] A39979      This command shall be equivalent to the *vi* command:39980      \$ [ *count* ] a39981      (see **Append**).39982      **Move Backward to Preceding Word**39983      *Synopsis:*      [ *count* ] b

39984      With the exception that words are used as the delimiter instead of bigwords, this command shall  
 39985      be equivalent to the **B** command.

39986      **Move Backward to Preceding Bigword**39987      *Synopsis:*      [ *count* ] B

39988      If the edit buffer is empty or the cursor is on the first character of the edit buffer, it shall be an  
 39989      error. If less than *count* bigwords begin between the cursor and the start of the edit buffer, *count*  
 39990      shall be adjusted to the number of bigword beginnings between the cursor and the start of the  
 39991      edit buffer.

39992      If used as a motion command:

39993      1. The text region shall be from the first character of the *count*th previous bigword beginning  
 39994      up to but not including the cursor character.

39995      2. Any text copied to a buffer shall be in character mode.

39996      If not used as a motion command:

39997      *Current line:* Set to the line containing the *current column*.

39998      *Current column:* Set to the last column upon which any part of the first character of the *count*th  
 39999      previous bigword is displayed.

40000      **Change**40001      *Synopsis:*      [ *buffer* ] [ *count* ] c *motion*40002      If the motion command is the *c* command repeated:

40003      1. The buffer text shall be in line mode.

40004      2. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an  
 40005      error.

40006           3. The text region shall be from the current line up to and including the next *count* –1 lines. |  
40007 Otherwise, the buffer text mode and text region shall be as specified by the motion command. |  
40008 The replaced text shall be copied into *buffer*, if specified, and into the unnamed buffer. If the text |  
40009 to be replaced contains characters from more than a single line, or the buffer text is in line mode, |  
40010 the replaced text shall be copied into the numeric buffers as well. |  
40011 If the buffer text is in line mode: |  
40012           1. Any lines that contain characters in the region shall be deleted, and the editor shall enter |  
40013 text input mode at the beginning of a new line which shall replace the first line deleted. |  
40014           2. If the **autoindent** edit option is set, **autoindent** characters equal to the **autoindent** |  
40015 characters on the first line deleted shall be inserted as if entered by the user. |  
40016 Otherwise, if characters from more than one line are in the region of text: |  
40017           1. The text shall be deleted. |  
40018           2. Any text remaining in the last line in the text region shall be appended to the first line in |  
40019 the region, and the last line in the region shall be deleted. |  
40020           3. The editor shall enter text input mode after the last character not deleted from the first line |  
40021 in the text region, if any; otherwise, on the first column of the first line in the region. |  
40022 Otherwise: |  
40023           1. If the glyph for ' \$ ' is smaller than the region, the end of the region shall be marked with a |  
40024 ' \$ '. |  
40025           2. The editor shall enter text input mode, overwriting the region of text. |  
40026 *Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi** |  
40027 on page 1064). |  
40028 **Change to End-of-Line** |  
40029 *Synopsis:*     [*buffer*][*count*] C |  
40030 This command shall be equivalent to the *vi* command: |  
40031 [*buffer*][*count*] c\$ |  
40032 See the **c** command. |  
40033 **Delete** |  
40034 *Synopsis:*     [*buffer*][*count*] d *motion* |  
40035 If the motion command is the **d** command repeated: |  
40036           1. The buffer text shall be in line mode. |  
40037           2. If there are less than *count* –1 lines after the current line in the edit buffer, it shall be an |  
40038 error. |  
40039           3. The text region shall be from the current line up to and including the next *count* –1 lines. |  
40040 Otherwise, the buffer text mode and text region shall be as specified by the motion command. |  
40041 If in open mode, and the current line is deleted, and the line remains on the display, an '@' |  
40042 character shall be displayed as the first glyph of that line. |

40043 Delete the region of text into *buffer*, if specified, and into the unnamed buffer. If the text to be  
 40044 deleted contains characters from more than a single line, or the buffer text is in line mode, the  
 40045 deleted text shall be copied into the numeric buffers, as well.

40046 *Current line*: Set to the first text region line that appears in the edit buffer, unless that line has  
 40047 been deleted, in which case it shall be set to the last line in the edit buffer, or line 1 if the edit  
 40048 buffer is empty.

40049 *Current column*:

- 40050 1. If the line is empty, set to column position 1.
- 40051 2. Otherwise, if the buffer text is in line mode or the motion was from the cursor toward the  
 40052 end of the edit buffer:
  - 40053 a. If a character from the current line is displayed in the current column, set to the last  
 40054 column that displays any portion of that character.
  - 40055 b. Otherwise, set to the last column in which any portion of any character in the line is  
 40056 displayed.
- 40057 3. Otherwise, if a character is displayed in the column that began the text region, set to the  
 40058 last column that displays any portion of that character.
- 40059 4. Otherwise, set to the last column in which any portion of any character in the line is  
 40060 displayed.

#### 40061 **Delete to End-of-Line**

40062 *Synopsis*: `[buffer] D`

40063 Delete the text from the current position to the end of the current line; equivalent to the *vi*  
 40064 command:

40065 `[buffer] d$`

#### 40066 **Move to End-of-Word**

40067 *Synopsis*: `[count] e`

40068 With the exception that words are used instead of bigwords as the delimiter, this command shall  
 40069 be equivalent to the *E* command.

#### 40070 **Move to End-of-Bigword**

40071 *Synopsis*: `[count] E`

40072 If the edit buffer is empty it shall be an error. If less than *count* bigwords end between the cursor  
 40073 and the end of the edit buffer, *count* shall be adjusted to the number of bigword endings between  
 40074 the cursor and the end of the edit buffer.

40075 If used as a motion command:

- 40076 1. The text region shall be from the last character of the *count*th next bigword up to and  
 40077 including the cursor character.
- 40078 2. Any text copied to a buffer shall be in character mode.

40079 If not used as a motion command:

40080 *Current line*: Set to the line containing the current column.

40081 *Current column*: Set to the last column upon which any part of the last character of the *countth*  
 40082 next bigword is displayed.

#### 40083 **Find Character in Current Line (Forward)**

40084 *Synopsis*: [ *count* ] f *character*

40085 It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

40086 If used as a motion command:

40087 1. The text range shall be from the cursor character up to and including the *countth*  
 40088 occurrence of the specified character after the cursor.

40089 2. Any text copied to a buffer shall be in character mode.

40090 If not used as a motion command:

40091 *Current line*: Unchanged.

40092 *Current column*: Set to the last column in which any portion of the *countth* occurrence of the  
 40093 specified character after the cursor appears in the line.

#### 40094 **Find Character in Current Line (Reverse)**

40095 *Synopsis*: [ *count* ] F *character*

40096 It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

40097 If used as a motion command:

40098 1. The text region shall be from the *countth* occurrence of the specified character before the  
 40099 cursor, up to, but not including the cursor character.

40100 2. Any text copied to a buffer shall be in character mode.

40101 If not used as a motion command:

40102 *Current line*: Unchanged.

40103 *Current column*: Set to the last column in which any portion of the *countth* occurrence of the  
 40104 specified character before the cursor appears in the line.

#### 40105 **Move to Line**

40106 *Synopsis*: [ *count* ] G

40107 If *count* is not specified, it shall default to the last line of the edit buffer. If *count* is greater than  
 40108 the last line of the edit buffer, it shall be an error.

40109 If used as a motion command:

40110 1. The text region shall be from the cursor line up to and including the specified line.

40111 2. Any text copied to a buffer shall be in line mode.

40112 If not used as a motion command:

40113 *Current line*: Set to *count* if *count* if specified; otherwise, the last line.

40114 *Current column*: Set to non-<blank>.

**40115 Move to Top of Screen**

40116 *Synopsis:* [count] H

40117 If the beginning of the line count greater than the first line of which any portion appears on the  
40118 display does not exist, it shall be an error.

40119 If used as a motion command:

- 40120 1. If in open mode, the text region shall be the current line.
- 40121 2. Otherwise, the text region shall be from the starting line up to and including (the first line  
40122 of the display + count -1).
- 40123 3. Any text copied to a buffer shall be in line mode.

40124 If not used as a motion command:

40125 If in open mode, this command shall set the current column to non-<blank> and do nothing else.

40126 Otherwise, it shall set the current line and current column as follows.

40127 *Current line:* Set to (the first line of the display + count -1).

40128 *Current column:* Set to non-<blank>.

**40129 Insert Before Cursor**

40130 *Synopsis:* [count] i

40131 Enter text input mode before the current cursor position. No characters already in the edit buffer  
40132 shall be affected by this command. A *count* shall cause the input text to be appended *count* -1  
40133 more times to the end of the input.

40134 *Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi**  
40135 on page 1064).

**40136 Insert at Beginning of Line**

40137 *Synopsis:* [count] I

40138 This command shall be equivalent to the *vi* command `^[count]i` command.

**40139 Join**

40140 *Synopsis:* [count] J

40141 If the current line is the last line in the edit buffer, it shall be an error.

40142 This command shall be equivalent to the *ex join* command with no addresses, and an *ex*  
40143 command *count* value of 1 if *count* was not specified or if a *count* of 1 was specified, and an *ex*  
40144 command *count* value of *count* -1 for any other value of *count*, except that the current line and  
40145 column shall be set as follows.

40146 *Current line:* Unchanged.

40147 *Current column:* The last column in which any portion of the character following the last  
40148 character in the initial line is displayed, or the last character in the line if no characters were  
40149 appended.

## 40150 **Move to Bottom of Screen**

40151 *Synopsis:*     [ *count* ] L

40152 If the beginning of the line count less than the last line of which any portion appears on the  
40153 display does not exist, it shall be an error.

40154 If used as a motion command:

- 40155     1. If in open mode, the text region shall be the current line.
- 40156     2. Otherwise, the text region shall include all lines from the starting cursor line to (the last  
40157 line of the display  $-(count - 1)$ ).
- 40158     3. Any text copied to a buffer shall be in line mode.

40159 If not used as a motion command:

- 40160     1. If in open mode, this command shall set the current column to non-<blank> and do  
40161 nothing else.
- 40162     2. Otherwise, it shall set the current line and current column as follows.

40163 *Current line:* Set to (the last line of the display  $-(count - 1)$ ).

40164 *Current column:* Set to non-<blank>.

## 40165 **Mark Position**

40166 *Synopsis:*     m *letter*

40167 This command shall be equivalent to the *ex mark* command with the specified character as an  
40168 argument.

## 40169 **Move to Middle of Screen**

40170 *Synopsis:*     M

40171 The middle line of the display shall be calculated as follows:

40172  $(\text{the top line of the display}) + (((\text{number of lines displayed}) + 1) / 2) - 1$

40173 If used as a motion command:

- 40174     1. If in open mode, the text region shall be the current line.
- 40175     2. Otherwise, the text region shall include all lines from the starting cursor line up to and  
40176 including the middle line of the display.
- 40177     3. Any text copied to a buffer shall be in line mode.

40178 If not used as a motion command:

40179 If in open mode, this command shall set the current column to non-<blank> and do nothing else.

40180 Otherwise, it shall set the current line and current column as follows.

40181 *Current line:* Set to the middle line of the display.

40182 *Current column:* Set to non-<blank>.

### 40183 **Repeat Regular Expression Find (Forward)**

40184 *Synopsis:*     n

40185 If the remembered search direction was forward, the **n** command shall be equivalent to the *vi /*  
40186 command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi ?*  
40187 command with no characters entered by the user.

40188 If the **n** command is used as a motion command for the **!** command, the editor shall not enter  
40189 text input mode on the last line on the screen, and shall behave as if the user entered a single '!'  
40190 character as the text input.

### 40191 **Repeat Regular Expression Find (Reverse)**

40192 *Synopsis:*     N

40193 Scan for the next match of the last pattern given to */* or *?*, but in the reverse direction; this is the  
40194 reverse of **n**.

40195 If the remembered search direction was forward, the **N** command shall be equivalent to the *vi ?*  
40196 command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi /*  
40197 command with no characters entered by the user. If the **N** command is used as a motion  
40198 command for the **!** command, the editor shall not enter text input mode on the last line on the  
40199 screen, and shall behave as if the user entered a single **!** character as the text input.

### 40200 **Insert Empty Line Below**

40201 *Synopsis:*     o

40202 Enter text input mode in a new line appended after the current line. A *count* shall cause the input  
40203 text to be appended *count* – 1 more times to the end of the already added text, each time starting  
40204 on a new, appended line.

40205 *Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi**  
40206 on page 1064).

### 40207 **Insert Empty Line Above**

40208 *Synopsis:*     O

40209 Enter text input mode in a new line inserted before the current line. A *count* shall cause the input  
40210 text to be appended *count* – 1 more times to the end of the already added text, each time starting  
40211 on a new, appended line.

40212 *Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi**  
40213 on page 1064).

### 40214 **Put from Buffer Following**

40215 *Synopsis:*     [*buffer*] p

40216 If no *buffer* is specified, the unnamed buffer shall be used.

40217 If the buffer text is in line mode, the text shall be appended below the current line, and each line  
40218 of the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be  
40219 appended *count* – 1 more times to the end of the already added text, each time starting on a new,  
40220 appended line.

40221 If the buffer text is in character mode, the text shall be appended into the current line after the  
40222 cursor, and each line of the buffer other than the first and last shall become a new line in the edit

40223 buffer. A *count* shall cause the buffer text to be appended *count* –1 more times to the end of the  
 40224 already added text, each time starting after the last added character.

40225 *Current line*: If the buffer text is in line mode, set the line to line +1; otherwise, unchanged.

40226 *Current column*: If the buffer text is in line mode:

40227 1. If there is a non-<blank> character in the first line of the buffer, set to the last column on  
 40228 which any portion of the first non-<blank> character in the line is displayed.

40229 2. If there is no non-<blank> character in the first line of the buffer, set to the last column on  
 40230 which any portion of the last character in the first line of the buffer is displayed.

40231 If the buffer text is in character mode:

40232 1. If the text in the buffer is from more than a single line, then set to the last column on which  
 40233 any portion of the first character from the buffer is displayed.

40234 2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any portion  
 40235 of the last character from the buffer is displayed.

40236 3. Otherwise, set to the first column on which any portion of the first character from the  
 40237 buffer is displayed.

#### 40238 **Put from Buffer Before**

40239 *Synopsis*: [ *buffer* ] P

40240 If no *buffer* is specified, the unnamed buffer shall be used.

40241 If the buffer text is in line mode, the text shall be inserted above the current line, and each line of  
 40242 the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be  
 40243 appended *count* –1 more times to the end of the already added text, each time starting on a new,  
 40244 appended line.

40245 If the buffer text is in character mode, the text shall be inserted into the current line before the  
 40246 cursor, and each line of the buffer other than the first and last shall become a new line in the edit  
 40247 buffer. A *count* shall cause the buffer text to be appended *count* –1 more times to the end of the  
 40248 already added text, each time starting after the last added character.

40249 *Current line*: Unchanged.

40250 *Current column*: If the buffer text is in line mode:

40251 1. If there is a non-<blank> character in the first line of the buffer, set to the last column on  
 40252 which any portion of that character is displayed.

40253 2. If there is no non-<blank> character in the first line of the buffer, set to the last column on  
 40254 which any portion of the last character in the first line of the buffer is displayed.

40255 If the buffer text is in character mode:

40256 1. If the buffer is the unnamed buffer, set to the last column on which any portion of the last  
 40257 character from the buffer is displayed.

40258 2. Otherwise, set to the first column on which any portion of the first character from the  
 40259 buffer is displayed.

40260      **Enter ex Mode**40261      *Synopsis:*      Q40262      Leave visual or open mode and enter *ex* command mode.40263      *Current line:* Unchanged.40264      *Current column:* Unchanged.40265      **Replace Character**40266      *Synopsis:*      [count] r character40267      Replace the *count* characters at and after the cursor with the specified character. If there are less  
40268      than *count* characters at and after the cursor on the line, it shall be an error.40269      If character is <control>-V, any next character other than the <newline> shall be stripped of any  
40270      special meaning and used as a literal character.40271      If character is <ESC>, no replacement shall be made and the current line and current column  
40272      shall be unchanged.40273      If character is <carriage-return> or <newline>, *count* new lines shall be appended to the current  
40274      line. All but the last of these lines shall be empty. *count* characters at and after the cursor shall be  
40275      discarded, and any remaining characters after the cursor in the current line shall be moved to the  
40276      last of the new lines. If the **autoindent** edit option is set, they shall be preceded by the same  
40277      number of **autoindent** characters found on the line from which the command was executed.40278      *Current line:* Unchanged unless the replacement character is a <carriage-return> or <newline>  
40279      character, in which case it shall be set to line + *count*.40280      *Current column:* Set to the last column position on which a portion of the last replaced character  
40281      is displayed, or if the replacement character caused new lines to be created, set to non-<blank>.40282      **Replace Characters**40283      *Synopsis:*      R40284      Enter text input mode at the current cursor position. A *count* shall cause the input text to be  
40285      appended *count* - 1 more times to the end of the input.40286      *Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi**  
40287      on page 1064).40288      **Substitute Character**40289      *Synopsis:*      [buffer][count] s40290      This command shall be equivalent to the *vi* command:

40291      [buffer][count] c&lt;space&gt;

## 40292 **Substitute Lines**

40293 *Synopsis:*     [*buffer*][*count*] S

40294 This command shall be equivalent to the *vi* command:

40295 [*buffer*][*count*] c\_

## 40296 **Move Cursor to Before Character (Forward)**

40297 *Synopsis:*     [*count*] t *character*

40298 It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

40299 If used as a motion command:

40300     1. The text region shall be from the cursor up to but not including the *count*th occurrence of  
40301       the specified character after the cursor.

40302     2. Any text copied to a buffer shall be in character mode.

40303 If not used as a motion command:

40304 *Current line:* Unchanged.

40305 *Current column:* Set to the last column in which any portion of the character before the *count*th  
40306 occurrence of the specified character after the cursor appears in the line.

## 40307 **Move Cursor to After Character (Reverse)**

40308 *Synopsis:*     [*count*] T *character*

40309 It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

40310 If used as a motion command:

40311     1. If the character before the cursor is the specified character, it shall be an error.

40312     2. The text region shall be from the character before the cursor up to but not including the  
40313       *count*th occurrence of the specified character before the cursor.

40314     3. Any text copied to a buffer shall be in character mode.

40315 If not used as a motion command:

40316 *Current line:* Unchanged.

40317 *Current column:* Set to the last column in which any portion of the character after the *count*th  
40318 occurrence of the specified character before the cursor appears in the line.

## 40319 **Undo**

40320 *Synopsis:*     u

40321 This command shall be equivalent to the ex **undo** command except that the current line and  
40322 current column shall be set as follows:

40323 *Current line:* Set to the first line added or changed if any; otherwise, move to the line preceding  
40324 any deleted text if one exists; otherwise, move to line 1.

40325 *Current column:* If undoing an ex command, set to the first non-<blank> character.

40326 Otherwise, if undoing a text input command:

40327 1. If the command was an **C**, **c**, **O**, **o**, **R**, **S**, or **s** command, the current column shall be set to  
40328 the value it held when the text input command was entered.

40329 2. Otherwise, set to the last column in which any portion of the first character after the  
40330 deleted text is displayed, or, if no characters follow the text deleted from this line, set to the  
40331 last column in which any portion of the last character in the line is displayed, or 1 if the line  
40332 is empty.

40333 Otherwise, if a single line was modified (that is, not added or deleted) by the **u** command:

40334 1. If text was added or changed, set to the last column in which any portion of the first  
40335 character added or changed is displayed.

40336 2. If text was deleted, set to the last column in which any portion of the first character after  
40337 the deleted text is displayed, or, if no characters follow the deleted text, set to the last  
40338 column in which any portion of the last character in the line is displayed, or 1 if the line is  
40339 empty.

40340 Otherwise, set to non-<blank>.

#### 40341 **Undo Current Line**

40342 *Synopsis:*     **U**

40343 Restore the current line to its state immediately before the most recent time that it became the  
40344 current line.

40345 *Current line:* Unchanged.

40346 *Current column:* Set to the first column in the line in which any portion of the first character in  
40347 the line is displayed.

#### 40348 **Move to Beginning of Word**

40349 *Synopsis:*     [*count*] **w**

40350 With the exception that words are used as the delimiter instead of bigwords, this command shall  
40351 be equivalent to the **W** command.

#### 40352 **Move to Beginning of Bigword**

40353 *Synopsis:*     [*count*] **W**

40354 If the edit buffer is empty, it shall be an error. If there are less than *count* bigwords between the  
40355 cursor and the end of the edit buffer, *count* shall be adjusted to move the cursor to the last  
40356 bigword in the edit buffer.

40357 If used as a motion command:

40358 1. If the associated command is **c**, *count* is 1, and the cursor is on a <blank> character, the  
40359 region of text shall be the current character and no further action shall be taken.

40360 2. If there are less than *count* bigwords between the cursor and the end of the edit buffer, then  
40361 the command shall succeed, and the region of text shall include the last character of the  
40362 edit buffer.

40363 3. If there are <blank> characters or an end-of-line that precede the *count*th bigword, and the  
40364 associated command is **c**, the region of text shall be up to and including the last character  
40365 before the preceding <blank> characters or end-of-line.

40366 4. If there are <blank> characters or an end-of-line that precede the bigword, and the  
 40367 associated command is **d** or **y**, the region of text shall be up to and including the last  
 40368 <blank> character before the start of the bigword or end-of-line.

40369 5. Any text copied to a buffer shall be in character mode.

40370 If not used as a motion command:

40371 1. If the cursor is on the last character of the edit buffer, it shall be an error.

40372 *Current line*: Set to the line containing the current column.

40373 *Current column*: Set to the last column in which any part of the first character of the *count*th next  
 40374 bigword is displayed.

### 40375 **Delete Character at Cursor**

40376 *Synopsis*: `[buffer][count] x`

40377 Delete the *count* characters at and after the current character into *buffer*, if specified, and into the  
 40378 unnamed buffer.

40379 If the line is empty, it shall be an error. If there are less than *count* characters at and after the  
 40380 cursor on the current line, *count* shall be adjusted to the number of characters at and after the  
 40381 cursor.

40382 *Current line*: Unchanged.

40383 *Current column*: If the line is empty, set to column position 1. Otherwise, if there were *count* or  
 40384 less characters at and after the cursor on the current line, set to the last column that displays any  
 40385 part of the last character of the line. Otherwise, unchanged.

### 40386 **Delete Character Before Cursor**

40387 *Synopsis*: `[buffer][count] X`

40388 Delete the *count* characters before the current character into *buffer*, if specified, and into the  
 40389 unnamed buffer.

40390 If there are no characters before the current character on the current line, it shall be an error. If  
 40391 there are less than *count* previous characters on the current line, *count* shall be adjusted to the  
 40392 number of previous characters on the line.

40393 *Current line*: Unchanged.

40394 *Current column*: Set to (*current column* – *the width of the deleted characters*).

### 40395 **Yank**

40396 *Synopsis*: `[buffer][count] y motion`

40397 Copy (yank) the region of text into *buffer*, if specified, and into the unnamed buffer.

40398 If the motion command is the **y** command repeated:

40399 1. The buffer shall be in line mode.

40400 2. If there are less than *count* – 1 lines after the current line in the edit buffer, it shall be an  
 40401 error.

40402 3. The text region shall be from the current line up to and including the next *count* – 1 lines.

|       |                                                                                                                             |  |
|-------|-----------------------------------------------------------------------------------------------------------------------------|--|
| 40403 | Otherwise, the buffer text mode and text region shall be as specified by the motion command.                                |  |
| 40404 | <i>Current line:</i> If the motion was from the current cursor position toward the end of the edit                          |  |
| 40405 | buffer, unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region                      |  |
| 40406 | specified by the motion command.                                                                                            |  |
| 40407 | <i>Current column:</i>                                                                                                      |  |
| 40408 | 1. If the motion was from the current cursor position toward the end of the edit buffer,                                    |  |
| 40409 | unchanged.                                                                                                                  |  |
| 40410 | 2. Otherwise, if the current line is empty, set to column position 1.                                                       |  |
| 40411 | 3. Otherwise, set to the last column that displays any part of the first character in the file that                         |  |
| 40412 | is part of the text region specified by the motion command.                                                                 |  |
| 40413 | <b>Yank Current Line</b>                                                                                                    |  |
| 40414 | <i>Synopsis:</i> [ <i>buffer</i> ][ <i>count</i> ] Y                                                                        |  |
| 40415 | This command shall be equivalent to the <i>vi</i> command:                                                                  |  |
| 40416 | [ <i>buffer</i> ][ <i>count</i> ] y_                                                                                        |  |
| 40417 | <b>Redraw Window</b>                                                                                                        |  |
| 40418 | If in open mode, the <i>z</i> command shall have the Synopsis:                                                              |  |
| 40419 | <i>Synopsis:</i> [ <i>count</i> ] z                                                                                         |  |
| 40420 | If <i>count</i> is not specified, it shall default to the <b>window</b> edit option -1. The <i>z</i> command shall be       |  |
| 40421 | equivalent to the <i>ex z</i> command, with a type character of = and a <i>count</i> of <i>count</i> -2, except that        |  |
| 40422 | the current line and current column shall be set as follows, and the <b>window</b> edit option shall not                    |  |
| 40423 | be affected. If the calculation for the <i>count</i> argument would result in a negative number, the                        |  |
| 40424 | <i>count</i> argument to the <i>ex z</i> command shall be zero. A blank line shall be written after the last line           |  |
| 40425 | is written.                                                                                                                 |  |
| 40426 | <i>Current line:</i> Unchanged.                                                                                             |  |
| 40427 | <i>Current column:</i> Unchanged.                                                                                           |  |
| 40428 | If not in open mode, the <i>z</i> command shall have the following Synopsis:                                                |  |
| 40429 | <i>Synopsis:</i> [ <i>line</i> ] z [ <i>count</i> ] <i>character</i>                                                        |  |
| 40430 | If <i>line</i> is not specified, it shall default to the current line. If <i>line</i> is specified, but is greater than the |  |
| 40431 | number of lines in the edit buffer, it shall default to the number of lines in the edit buffer.                             |  |
| 40432 | If <i>count</i> is specified, the value of the <b>window</b> edit option shall be set to <i>count</i> (as described in the  |  |
| 40433 | <i>ex window</i> command), and the screen shall be redrawn.                                                                 |  |
| 40434 | <i>line</i> shall be placed as specified by the following characters:                                                       |  |
| 40435 | <newline>, <carriage-return>                                                                                                |  |
| 40436 | Place the beginning of the line on the first line of the display.                                                           |  |
| 40437 | . Place the beginning of the line in the center of the display. The middle line of the display                              |  |
| 40438 | shall be calculated as described for the <b>M</b> command.                                                                  |  |
| 40439 | - Place an unspecified portion of the line on the last line of the display.                                                 |  |
| 40440 | + If <i>line</i> was specified, equivalent to the <newline> case. If <i>line</i> was not specified, display a               |  |
| 40441 | screen where the first line of the display shall be (current last line) +1. If there are no lines                           |  |

40442 after the last line in the display, it shall be an error.

40443 ^ If *line* was specified, display a screen where the last line of the display shall contain an  
 40444 unspecified portion of the first line of a display that had an unspecified portion of the  
 40445 specified line on the last line of the display. If this calculation results in a line before the  
 40446 beginning of the edit buffer, display the first screen of the edit buffer.

40447 Otherwise, display a screen where the last line of the display shall contain an unspecified  
 40448 portion of (current first line -1). If this calculation results in a line before the beginning of  
 40449 the edit buffer, it shall be an error.

40450 *Current line:* If *line* and the ' ^ ' character were specified:

40451 1. If the first screen was displayed as a result of the command attempting to display lines  
 40452 before the beginning of the edit buffer: if the first screen was already displayed,  
 40453 unchanged; otherwise, set to (current first line -1).

40454 2. Otherwise, set to the last line of the display.

40455 If *line* and the ' + ' character were specified, set to the first line of the display.

40456 Otherwise, if *line* was specified, set to *line*.

40457 Otherwise, unchanged.

40458 *Current column:* Set to non-<blank>.

40459 **Exit**

40460 *Synopsis:*      ZZ

40461 This command shall be equivalent to the **ex xit** command with no addresses, trailing !, or file  
 40462 name (see the **ex xit** command).

40463 **Input Mode Commands in vi**

40464 In text input mode, the current line shall consist of zero or more of the following categories:

40465 1. Characters preceding the text input entry point  
 40466 Characters in this category shall not be modified during text input mode.

40467 2. **autoindent** characters

40468 **autoindent** characters shall be automatically inserted into each line that is created in text  
 40469 input mode, either as a result of entering a <newline> character or <carriage-return>  
 40470 character while in text input mode, or as an effect of the command itself; for example, **O** or  
 40471 **o** (see the **ex autoindent** command), as if entered by the user.

40472 It shall be possible to erase **autoindent** characters with the <control>-D command; it is  
 40473 unspecified whether they can be erased by <control>-H, <control>-U, and <control>-W  
 40474 characters. Erasing any **autoindent** character turns the glyph into erase-columns and  
 40475 deletes the character from the edit buffer, but does not change its representation on the  
 40476 screen.

40477 3. Text input characters

40478 Text input characters are the characters entered by the user. Erasing any text input  
 40479 character turns the glyph into erase-columns and deletes the character from the edit buffer,  
 40480 but does not change its representation on the screen.

- Each text input character entered by the user (that does not have a special meaning) shall be treated as follows:
- a. The text input character shall be appended to the last character in the edit buffer from the first, second, or third categories.
  - b. If there are no erase-columns on the screen, the text input command was the **R** command, and characters in the fifth category from the original line follow the cursor, the next such character shall be deleted from the edit buffer. If the **slowopen** edit option is not set, the corresponding glyph on the screen shall become erase-columns.
  - c. If there are erase-columns on the screen, as many columns as they occupy, or as are necessary, shall be overwritten to display the text input character. (If only part of a multi-column glyph is overwritten, the remainder shall be left on the screen, and continue to be treated as erase-columns; it is unspecified whether the remainder of the glyph is modified in any way.)
  - d. If additional screen columns are needed to display the text input character:
    1. If the **slowopen** edit option is set, the text input characters shall be displayed on subsequent screen columns, overwriting any characters displayed in those columns.
    2. Otherwise, any characters currently displayed on or after the column on the screen where the text input character is to be displayed shall be pushed ahead the number of screen columns necessary to display the rest of the text input character.
4. Erase-columns
- Erase-columns are not logically part of the edit buffer, appearing only on the screen, and may be overwritten on the screen by subsequent text input characters. When text input mode ends, all erase-columns shall no longer appear on the screen.
- Erase-columns are initially the region of text specified by the **c** command ( see **Change** on page 1051) however, erasing **autoindent** or text input characters causes the glyphs of the erased characters to be treated as erase-columns.
5. Characters following the text region for the **c** command, or the text input entry point for all other commands
- Characters in this category shall not be modified during text input mode, except as specified in category 3.b. for the **R** text input command, or as <blank> characters deleted when a <newline> character or <carriage-return> character is entered.
- It is unspecified whether it is an error to attempt to erase past the beginning of a line that was created by the entry of a <newline> or <carriage-return> character during text input mode. If it is not an error, the editor shall behave as if the erasing character was entered immediately after the last text input character entered on the previous line, and all of the characters on the current line shall be treated as erase-columns.
- When text input mode is entered, or after a text input mode character is entered (except as specified for the special characters below), the cursor shall be positioned as follows:
1. On the first column that displays any part of the first erase-column, if one exists
  2. Otherwise, if the **slowopen** edit option is set, on the first screen column after the last character in the first, second, or third categories, if one exists

- 40525 3. Otherwise, the first column that displays any part of the first character in the fifth category,  
40526 if one exists
- 40527 4. Otherwise, the screen column after the last character in the first, second, or third  
40528 categories, if one exists
- 40529 5. Otherwise, on column position 1

40530 The characters that are updated on the screen during text input mode are unspecified, other than  
40531 that the last text input character shall always be updated, and, if the **slowopen** edit option is not  
40532 set, the current cursor character shall always be updated.

40533 The following specifications are for command characters entered during text input mode.

#### 40534 NUL

40535 *Synopsis:* NUL

40536 If the first character of the text input is a NUL, the most recently input text shall be input as if  
40537 entered by the user, and then text input mode shall be exited. The text shall be input literally;  
40538 that is, characters are neither macro or abbreviation expanded, nor are any characters interpreted  
40539 in any special manner. It is unspecified whether implementations shall support more than 256  
40540 bytes of remembered input text.

#### 40541 <control>-D

40542 *Synopsis:* <control>-D

40543 The <control>-D character shall have no special meaning when in text input mode for a line-  
40544 oriented command (see **Command Descriptions in vi** on page 1031).

40545 This command need not be supported on block-mode terminals.

40546 If the cursor does not follow an **autoindent** character, or an **autoindent** character and a '0' or  
40547 '^' character:

- 40548 1. If the cursor is in column position 1, the <control>-D character shall be discarded and no  
40549 further action taken.
- 40550 2. Otherwise, the <control>-D character shall have no special meaning.

40551 If the last input character was a '0', the cursor shall be moved to column position 1.

40552 Otherwise, if the last input character was a '^', the cursor shall be moved to column position 1.  
40553 In addition, the **autoindent** level for the next input line shall be derived from the same line from  
40554 which the **autoindent** level for the current input line was derived.

40555 Otherwise, the cursor shall be moved back to the column after the previous shiftwidth (see the  
40556 **ex shiftwidth** command) boundary.

40557 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
40558 cursor position shall become erase-columns as described in **Input Mode Commands in vi** on  
40559 page 1064.

40560 *Current line:* Unchanged.

40561 *Current column:* Set to 1 if the <control>-D was preceded by a '^' or '0'; otherwise, set to  
40562 (column - 1) - ((column - 2) % **shiftwidth**).

|       |                                                                                                                 |                                |
|-------|-----------------------------------------------------------------------------------------------------------------|--------------------------------|
| 40563 | <b>&lt;control&gt;-H</b>                                                                                        |                                |
| 40564 | <i>Synopsis:</i>                                                                                                | <b>&lt;control&gt;-H</b>       |
| 40565 | If in text input mode for a line-oriented command, and there are no characters to erase, text                   |                                |
| 40566 | input mode shall be terminated, no further action shall be done for this command, and the                       |                                |
| 40567 | current line and column shall be unchanged.                                                                     |                                |
| 40568 | If there are characters other than <b>autoindent</b> characters that have been input on the current line        |                                |
| 40569 | before the cursor, the cursor shall move back one character.                                                    |                                |
| 40570 | Otherwise, if there are <b>autoindent</b> characters on the current line before the cursor, it is               |                                |
| 40571 | implementation-dependent whether the <b>&lt;control&gt;-H</b> command is an error or if the cursor              |                                |
| 40572 | moves back one <b>autoindent</b> character.                                                                     |                                |
| 40573 | Otherwise, if the cursor is in column position 1 and there are previous lines that have been input,             |                                |
| 40574 | it is implementation-dependent whether the <b>&lt;control&gt;-H</b> command is an error or if it is             |                                |
| 40575 | equivalent to entering <b>&lt;control&gt;-H</b> after the last input character on the previous input line.      |                                |
| 40576 | Otherwise, it shall be an error.                                                                                |                                |
| 40577 | All of the glyphs on columns between the starting cursor position and (inclusively) the ending                  |                                |
| 40578 | cursor position shall become erase-columns as described in <b>Input Mode Commands in vi</b> on                  |                                |
| 40579 | page 1064.                                                                                                      |                                |
| 40580 | The current erase character (see <i>stty</i> ) shall cause an equivalent action to the <b>&lt;control&gt;-H</b> |                                |
| 40581 | command, unless the previously inserted character was a backslash, in which case it shall be as                 |                                |
| 40582 | if the literal current erase character had been inserted instead of the backslash.                              |                                |
| 40583 | <i>Current line:</i> Unchanged, unless previously input lines are erased, in which case it shall be set to      |                                |
| 40584 | line -1.                                                                                                        |                                |
| 40585 | <i>Current column:</i> Set to the first column that displays any portion of the character backed up             |                                |
| 40586 | over.                                                                                                           |                                |
| 40587 | <b>&lt;newline&gt;</b>                                                                                          |                                |
| 40588 | <i>Synopsis:</i>                                                                                                | <b>&lt;newline&gt;</b>         |
| 40589 |                                                                                                                 | <b>&lt;carriage-return&gt;</b> |
| 40590 |                                                                                                                 | <b>&lt;control&gt;-J</b>       |
| 40591 |                                                                                                                 | <b>&lt;control&gt;-M</b>       |
| 40592 | If input was part of a line-oriented command, text input mode shall be terminated and the                       |                                |
| 40593 | command shall continue execution with the input provided.                                                       |                                |
| 40594 | Otherwise, terminate the current line. If there are no characters other than <b>autoindent</b> characters       |                                |
| 40595 | on the line, all characters on the line shall be discarded. Otherwise, it is unspecified whether the            |                                |
| 40596 | <b>autoindent</b> characters in the line are modified by entering these characters.                             |                                |
| 40597 | Continue text input mode on a new line appended after the current line. If the <b>slowopen</b> edit             |                                |
| 40598 | option is set, the lines on the screen below the current line shall not be pushed down, but the                 |                                |
| 40599 | first of them shall be cleared and shall appear to be overwritten. Otherwise, the lines of the                  |                                |
| 40600 | screen below the current line shall be pushed down.                                                             |                                |
| 40601 | If the <b>autoindent</b> edit option is set, an appropriate number of <b>autoindent</b> characters shall be     |                                |
| 40602 | added as a prefix to the line as described by the <b>ex autoindent</b> edit option.                             |                                |
| 40603 | All columns after the cursor that are erase-columns (as described in <b>Input Mode Commands in</b>              |                                |
| 40604 | <b>vi</b> on page 1064) shall be discarded.                                                                     |                                |

40605 If the **autoindent** edit option is set, all <blank> characters immediately following the cursor shall  
 40606 be discarded.

40607 All remaining characters after the cursor shall be transferred to the new line, positioned after any  
 40608 **autoindent** characters.

40609 *Current line:* Set to current line +1.

40610 *Current column:* Set to the first column that displays any portion of the first character after the  
 40611 **autoindent** characters on the new line, if any, or the first column position after the last  
 40612 **autoindent** character, if any, or column position 1.

40613 **<control>-T**

40614 *Synopsis:*     <control>-T

40615 The <control>-T character shall have no special meaning when in text input mode for a line-  
 40616 oriented command (see **Command Descriptions in vi** on page 1031).

40617 This command need not be supported on block-mode terminals.

40618 Behave as if the user entered the minimum number of <<blank>> characters necessary to move  
 40619 the cursor forward to the column position after the next **shiftwidth** (see the *ex* **shiftwidth**  
 40620 command) boundary.

40621 *Current line:* Unchanged.

40622 *Current column:* Set to  $column + shiftwidth - ((column - 1) \% shiftwidth)$ .

40623 **<control>-U**

40624 *Synopsis:*     <control>-U

40625 If there are characters other than **autoindent** characters that have been input on the current line  
 40626 before the cursor, the cursor shall move to the first character input after the **autoindent**  
 40627 characters.

40628 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is  
 40629 implementation-dependent whether the <control>-U command is an error or if the cursor moves  
 40630 to the first column position on the line.

40631 Otherwise, if the cursor is in column position 1 and there are previous lines that have been input,  
 40632 it is implementation-dependent whether the <control>-U command is an error or if it is  
 40633 equivalent to entering <control>-U after the last input character on the previous input line.

40634 Otherwise, it shall be an error.

40635 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 40636 cursor position shall become erase-columns as described in **Input Mode Commands in vi** on  
 40637 page 1064.

40638 The current *kill* character (see *stty*) shall cause an equivalent action to the <control>-U  
 40639 command, unless the previously inserted character was a backslash, in which case it shall be as  
 40640 if the literal current *kill* character had been inserted instead of the backslash.

40641 *Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to  
 40642 line -1.

40643 *Current column:* Set to the first column that displays any portion of the last character backed up  
 40644 over.

40645        **<control>-V**

40646        *Synopsis:*        <control>-V  
 40647                    <control>-Q

40648        Allow the entry of any subsequent character, other than <control>-J or the character, as a literal  
 40649        character, removing any special meaning that it may have to the editor in text input mode. If a  
 40650        <control>-V or <control>-Q is entered before a <control>-J or <newline> character, the  
 40651        <control>-V or <control>-Q character shall be discarded, and the <control>-J or <newline> shall  
 40652        behave as described in the <newline> command character during input mode.

40653        For purposes of the display only, the editor shall behave as if a '^' character was entered, and  
 40654        the cursor shall be positioned as if overwriting the '^' character. When a subsequent character  
 40655        is entered, the editor shall behave as if that character was entered instead of the original  
 40656        <control>-V or <control>-Q character.

40657        *Current line:* Unchanged.

40658        *Current column:* Unchanged.

40659        **<control>-W**

40660        *Synopsis:*        <control>-W

40661        If there are characters other than **autoindent** characters that have been input on the current line  
 40662        before the cursor, the cursor shall move back over the last word preceding the cursor (including  
 40663        any <blank> characters between the end of the last word and the current cursor); the cursor shall  
 40664        not move to before the first character after the end of any **autoindent** characters.

40665        Otherwise, if there are **autoindent** characters on the current line before the cursor, it is  
 40666        implementation-dependent whether the <control>-W command is an error or if the cursor  
 40667        moves to the first column position on the line.

40668        Otherwise, if the cursor is in column position 1 and there are previous lines that have been input,  
 40669        it is implementation-dependent whether the <control>-W command is an error or if it is  
 40670        equivalent to entering <control>-W after the last input character on the previous input line.

40671        Otherwise, it shall be an error.

40672        All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 40673        cursor position shall become erase-columns as described in **Input Mode Commands in vi** on  
 40674        page 1064.

40675        *Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to  
 40676        line -1.

40677        *Current column:* Set to the first column that displays any portion of the last character backed up  
 40678        over.

40679        **<ESC>**

40680        *Synopsis:*        <ESC>

40681        If input was part of a line-oriented command:

- 40682        1. If *interrupt* was entered, text input mode shall be terminated and the editor shall return to  
 40683        command mode. The terminal shall be alerted.
- 40684        2. If <ESC> was entered, text input mode shall be terminated and the command shall  
 40685        continue execution with the input provided.

|       |                                                                                                                        |
|-------|------------------------------------------------------------------------------------------------------------------------|
| 40686 | Otherwise, terminate text input mode and return to command mode.                                                       |
| 40687 | Any <b>autoindent</b> characters entered on newly created lines that have no other characters shall be                 |
| 40688 | deleted.                                                                                                               |
| 40689 | Any leading <b>autoindent</b> and <<blank>> characters on newly created lines shall be rewritten to                    |
| 40690 | be the minimum number of <<blank>> characters possible.                                                                |
| 40691 | The screen shall be redisplayed as necessary to match the contents of the edit buffer.                                 |
| 40692 | <i>Current line:</i> Unchanged.                                                                                        |
| 40693 | <i>Current column:</i>                                                                                                 |
| 40694 | 1. If there are text input characters on the current line, the column shall be set to the last                         |
| 40695 | column where any portion of the last text input character is displayed.                                                |
| 40696 | 2. Otherwise, if a character is displayed in the current column, unchanged.                                            |
| 40697 | 3. Otherwise, set to column position 1.                                                                                |
| 40698 | <b>EXIT STATUS</b>                                                                                                     |
| 40699 | The following exit values shall be returned:                                                                           |
| 40700 | 0 Successful completion.                                                                                               |
| 40701 | >0 An error occurred.                                                                                                  |
| 40702 | <b>CONSEQUENCES OF ERRORS</b>                                                                                          |
| 40703 | When any error is encountered and the standard input is not a terminal device file, <i>vi</i> shall not                |
| 40704 | write the file or return to command or text input mode, and shall terminate with a non-zero exit                       |
| 40705 | status.                                                                                                                |
| 40706 | Otherwise, when an unrecoverable error is encountered it shall be equivalent to a SIGHUP                               |
| 40707 | asynchronous event.                                                                                                    |
| 40708 | Otherwise, when an error is encountered, the editor shall behave as specified in <b>Command</b>                        |
| 40709 | <b>Descriptions in vi</b> on page 1031.                                                                                |
| 40710 | <b>APPLICATION USAGE</b>                                                                                               |
| 40711 | Application writers should note that this utility need not be provided on systems that do not                          |
| 40712 | support the User Portability Utilities option.                                                                         |
| 40713 | <b>EXAMPLES</b>                                                                                                        |
| 40714 | None.                                                                                                                  |
| 40715 | <b>RATIONALE</b>                                                                                                       |
| 40716 | See the RATIONALE for <i>ex</i> for more information on <i>vi</i> . Major portions of the <i>vi</i> utility            |
| 40717 | specification point to <i>ex</i> to avoid inadvertent divergence. While <i>ex</i> and <i>vi</i> have historically been |
| 40718 | implemented as a single utility, this is not required by IEEE Std. 1003.1-200x.                                        |
| 40719 | It is recognized that portions of <i>vi</i> would be difficult, if not impossible, to implement                        |
| 40720 | satisfactorily on a block-mode terminal, or a terminal without any form of cursor addressing,                          |
| 40721 | thus it is not a mandatory requirement that such features should work on all terminals. It is the                      |
| 40722 | intention, however, that a <i>vi</i> implementation should provide the full set of capabilities on all                 |
| 40723 | terminals capable of supporting them.                                                                                  |
| 40724 | Historically, <i>vi</i> exited immediately if the standard input was not a terminal.                                   |
| 40725 | IEEE Std. 1003.1-200x permits, but does not require, this behavior. An end-of-file condition is not                    |
| 40726 | equivalent to an end-of-file character. A common end-of-file character, <control>-D, is                                |
| 40727 | historically a <i>vi</i> command.                                                                                      |

40728 The text in the STANDARD OUTPUT section reflects the usage of the verb *display* in this section;  
 40729 some implementations of *vi* use standard output to write to the terminal, but  
 40730 IEEE Std. 1003.1-200x does not require that to be the case.

40731 Historically, implementations reverted to open mode if the terminal was incapable of  
 40732 supporting full visual mode. IEEE Std. 1003.1-200x requires this behavior. Historically, the open  
 40733 mode of *vi* behaved roughly equivalently to the visual mode, with the exception that only a  
 40734 single physical line from the edit buffer was kept current at any time. This line was normally  
 40735 displayed on the next-to-last line of a terminal with cursor addressing (and the last line  
 40736 performed its normal visual functions for line-oriented commands and messages). In addition,  
 40737 some few commands behaved differently in open mode than in visual mode.  
 40738 IEEE Std. 1003.1-200x requires conformance to historical practice.

40739 Historically, *ex* and *vi* implementations have expected text to proceed in the usual  
 40740 European/Latin order of left to right, top to bottom. There is no requirement in  
 40741 IEEE Std. 1003.1-200x that this be the case. The specification was deliberately written using  
 40742 words like “before”, “after”, “first”, and “last” in order to permit implementations to support  
 40743 the natural text order of the language.

40744 Historically, lines past the end of the edit buffer were marked with single tilde (‘~’) characters;  
 40745 that is, if the one-based display was 20 lines in length, and the last line of the file was on line one,  
 40746 then lines 2-20 would contain only a single ‘~’ character.

40747 Historically, the *vi* editor attempted to display only complete lines at the bottom of the screen (it  
 40748 did display partial lines at the top of the screen). If a line was too long to fit in its entirety at the  
 40749 bottom of the screen, the screen lines where the line would have been displayed were displayed  
 40750 as single ‘@’ characters, instead of displaying part of the line. IEEE Std. 1003.1-200x permits, but  
 40751 does not require, this behavior. Implementations are encouraged to attempt always to display a  
 40752 complete line at the bottom of the screen when doing scrolling or screen positioning by physical  
 40753 lines.

40754 Historically, lines marked with ‘@’ were also used to minimize output to dumb terminals over  
 40755 slow lines; that is, changes local to the cursor were updated, but changes to lines on the screen  
 40756 that were not close to the cursor were simply marked with an ‘@’ sign instead of being updated  
 40757 to match the current text. IEEE Std. 1003.1-200x permits, but does not require this feature  
 40758 because it is used ever less frequently as terminals become smarter and connections are faster.

#### 40759 Initialization in *ex* and *vi*

40760 Historically, *vi* always had a line in the edit buffer, even if the edit buffer was “empty”. For  
 40761 example:

- 40762 1. The *ex* command = executed from visual mode wrote “1” when the buffer was empty.
- 40763 2. Writes from visual mode of an empty edit buffer wrote files of a single character (a  
 40764 <newline> character), while writes from *ex* mode of an empty edit buffer wrote empty  
 40765 files.
- 40766 3. Put and read commands into an empty edit buffer left an empty line at the top of the edit  
 40767 buffer.

40768 For consistency, IEEE Std. 1003.1-200x does not permit any of these behaviors.

40769 Historically, *vi* did not always return the terminal to its original modes; for example, ICRNL was  
 40770 modified if it was not originally set. IEEE Std. 1003.1-200x does not permit this behavior.

## Command Descriptions in vi

Motion commands are among the most complicated aspects of *vi* to describe. With some exceptions, the text region and buffer type effect of a motion command on a *vi* command are described on a case-by-case basis. The descriptions of text regions in IEEE Std. 1003.1-200x are not intended to imply direction; that is, an inclusive region from line *n* to line *n*+5 is identical to a region from line *n*+5 to line *n*. This is of more than academic interest—movements to marks can be in either direction, and, if the **wrapscan** option is set, so can movements to search points. Historically, lines are always stored into buffers in text order; that is, from the start of the edit buffer to the end. IEEE Std. 1003.1-200x requires conformance to historical practice.

Historically, command counts were applied to any associated motion, and were multiplicative to any supplied motion count. For example, **2cw** is the same as **c2w**, and **2c3w** is the same as **c6w**. IEEE Std. 1003.1-200x requires this behavior. Historically, *vi* commands that used bigwords, words, paragraphs, and sentences as objects treated groups of empty lines, or lines that contained only <blank> characters, inconsistently. Some commands treated them as a single entity, while others treated each line separately. For example, the **w**, **W**, and **B** commands treated groups of empty lines as individual words; that is, the command would move the cursor to each new empty line. The **e** and **E** commands treated groups of empty lines as a single word; that is, the first use would move past the group of lines. The **b** command would just beep at the user, or if done from the start of the line as a motion command, fail in unexpected ways. If the lines contained only (or ended with) <blank> characters, the **w** and **W** commands would just beep at the user, the **E** and **e** commands would treat the group as a single word, and the **B** and **b** commands would treat the lines as individual words. For consistency and simplicity of specification, IEEE Std. 1003.1-200x requires that all *vi* commands treat groups of empty or <blank> character-filled lines as a single entity, and that movement through lines ending with <blank> characters be consistent with other movements.

Historically, *vi* documentation indicated that any number of double quotes were skipped after punctuation marks at sentence boundaries; however, implementations only skipped single quotes. IEEE Std. 1003.1-200x requires both to be skipped.

Historically, the first and last characters in the edit buffer were word boundaries. This historical practice is required by IEEE Std. 1003.1-200x.

Historically, *vi* attempted to update the minimum number of columns on the screen possible, which could lead to misleading information being displayed. IEEE Std. 1003.1-200x makes no requirements other than that the current character being entered is displayed correctly, leaving all other decisions in this area up to the implementation.

Historically, lines were arbitrarily folded between columns of any characters that required multiple column positions on the screen, with the exception of tabs, which terminated at the right-hand margin. IEEE Std. 1003.1-200x permits the former and requires the latter. Implementations that do not arbitrarily break lines between columns of characters that occupy multiple column positions should not permit the cursor to rest on a column that does not contain any part of a character.

The historical *vi* had a problem in that all movements were by physical lines, not by logical, or screen, lines. This is often the right thing to do; for example, single line movements, such as **j** or **k**, should work on physical lines. Commands like **dj**, or **j.**, where **.** is a change command, only make sense for physical lines. It is not, however, the right thing to do for screen motion or scrolling commands like <control>-D, <control>-F, and **H**. If the window is fairly small, using physical lines in these cases can result in completely random motion; for example, **1<control>-D** can result in a completely changed screen, without any overlap. This is clearly not what the user wanted. The problem is even worse in the case of the **H**, **L**, and **M** commands—as they position the cursor at the first non-<blank> character of the line, they may all refer to the same location in

40820 large lines, and will result in no movement at all.

40821 In addition, if the line is larger than the screen, using physical lines can make it impossible to  
40822 display parts of the line—there are not any commands that do not display the beginning of the  
40823 line in historical *vi*, and if both the beginning and end of the line cannot be on the screen at the  
40824 same time, the user suffers. Finally, the page and half-page scrolling commands historically  
40825 moved to the first non-<blank> character in the new line. If the line is approximately the same  
40826 size as the screen, this is inadequate because the cursor before and after a <control>-D command  
40827 will refer to the same location on the screen.

40828 Implementations of *ex* and *vi* exist that do not have these problems because the relevant  
40829 commands (<control>-B, <control>-D, <control>-F, <control>-U, <control>-Y, <control>-E, **H**, **L**,  
40830 and **M**) operate on logical screen lines, not physical edit buffer lines.

40831 IEEE Std. 1003.1-200x does not permit this behavior by default because the standard developers  
40832 believed that users would find it too confusing. However, historical practice has been relaxed.  
40833 For example, *ex* and *vi* historically attempted, albeit sometimes unsuccessfully, to never put part  
40834 of a line on the last lines of a screen; for example, if a line would not fit in its entirety, no part of  
40835 the line was displayed, and the screen lines corresponding to the line contained single '@'  
40836 characters. This behavior is permitted, but not required by IEEE Std. 1003.1-200x, so that it is  
40837 possible for implementations to support long lines in small screens more reasonably without  
40838 changing the commands to be logically (instead of physically) oriented. IEEE Std. 1003.1-200x  
40839 also permits implementations to refuse to edit any edit buffer containing a line that will not fit  
40840 on the screen in its entirety.

40841 The display area (for example, the value of the **window** edit option) has historically been  
40842 “grown”, or expanded, to display new text when local movements are done in displays where  
40843 the number of lines displayed is less than the maximum possible. Expansion has historically  
40844 been the first choice, when the target line is less than the maximum possible expansion value  
40845 away. Scrolling has historically been the next choice, done when the target line is less than half a  
40846 display away, and otherwise, the screen was redrawn. There were exceptions, however, in that  
40847 *ex* commands generally always caused the screen to be redrawn. IEEE Std. 1003.1-200x does not  
40848 specify a standard behavior because there may be external issues, such as connection speed, the  
40849 number of characters necessary to redraw as opposed to scroll, or terminal capabilities that  
40850 implementations will have to accommodate.

40851 The current line in IEEE Std. 1003.1-200x maps one-to-one to a physical line in the file. The  
40852 current column does not. There are two different column values that are described by  
40853 IEEE Std. 1003.1-200x. The first is the current column value as set by many of the *vi* commands.  
40854 This value is remembered for the lifetime of the editor. The second column value is the actual  
40855 position on the screen where the cursor rests. The two are not always the same. For example,  
40856 when the cursor is backed by a multi-column character, the actual cursor position on the screen  
40857 has historically been the last column of the character in command mode, and the first column of  
40858 the character in input mode.

40859 Commands that set the current line, but that do not set the current cursor value (for example, **j**  
40860 and **k**) attempt to get as close as possible to the remembered column position, so that the cursor  
40861 tends to restrict itself to a vertical column as the user moves around in the edit buffer.  
40862 IEEE Std. 1003.1-200x requires conformance to historical practice, requiring that the physical  
40863 location of the cursor on the screen be adjusted from the current column value as necessary to  
40864 support this historical behavior.

40865 Historically, only a single line (and for some terminals, a single line minus 1 column) of  
40866 characters could be entered by the user for the line oriented commands; that is, :, !, /, or ?.  
40867 IEEE Std. 1003.1-200x permits, but does not require, this limitation.

Historically, “soft” errors in *vi* caused the terminal to be alerted, but no error message was displayed. As a general rule, no error message was displayed for errors in command execution in *vi*, when the error resulted from the user attempting an invalid or impossible action, or when a searched-for object was not found. Examples of soft errors included **h** at the left margin, **<control>-B** or **[** at the beginning of the file, **2G** at the end of the file, and so on. In addition, errors such as **%**, **]**, **}**, **)**, **N**, **n**, **f**, **F**, **t**, and **T** failing to find the searched-for object were soft as well. Less consistently, **/** and **?** displayed an error message if the pattern was not found, **/**, **?**, **N**, and **n** displayed an error message if no previous regular expression had been specified, and **;** did not display an error message if no previous **f**, **F**, **t**, or **T** command had occurred. Also, behavior in this area might reasonably be based on a runtime evaluation of the speed of a network connection. Finally, some implementations have provided error messages for soft errors in order to assist naive users, based on the value of a verbose edit option. IEEE Std. 1003.1-200x does not list specific errors for which an error message shall be displayed. Implementations should conform to historical practice in the absence of any strong reason to diverge.

### Page Backwards

The **<control>-B** and **<control>-F** commands historically considered it an error to attempt to page past the beginning or end of the file, whereas the **<control>-D** and **<control>-U** commands simply moved to the beginning or end of the file. For consistency, IEEE Std. 1003.1-200x requires the latter behavior for all four commands. All four commands still consider it an error if the current line is at the beginning (**<control>-B**, **<control>-U**) or end (**<control>-F**, **<control>-D**) of the file. Historically, the **<control>-B** and **<control>-F** commands skip two lines in order to include overlapping lines when a single command is entered. This makes less sense in the presence of a *count*, as there will be, by definition, no overlapping lines. The actual calculation used by historical implementations of the *vi* editor for **<control>-B** was:

$((\text{current first line}) - \text{count } W \text{ (window edit option)}) + 2$

and for **<control>-F** was:

$((\text{current first line}) + \text{count } W \text{ (window edit option)}) - 2$

This calculation does not work well when intermixing commands with and without counts; for example, **3<control>-F** is not equivalent to entering the **<control>-F** command three times, and is not reversible by entering the **<control>-B** command three times. For consistency with other *vi* commands that take counts, IEEE Std. 1003.1-200x requires a different calculation.

### Scroll Forward

The 4BSD and System V implementations of *vi* differed on the initial value used by the **scroll** command. 4BSD used:

$((\text{window edit option}) + 1) / 2$

while System V used the value of the **scroll** edit option. The System V version is specified by IEEE Std. 1003.1-200x because the standard developers believed that it was more intuitive and permitted the user a method of setting the scroll value initially without also setting the number of lines that are displayed.

#### 40907 **Scroll Forward by Line**

40908 Historically, the <control>-E and <control>-Y commands considered it an error if the last and  
 40909 first lines, respectively, were already on the screen. IEEE Std. 1003.1-200x requires conformance  
 40910 to historical practice. Historically, the <control>-E and <control>-Y commands had no effect in  
 40911 open mode. For simplicity and consistency of specification, IEEE Std. 1003.1-200x requires that  
 40912 they behave as usual, albeit with a single line screen.

#### 40913 **Clear and Redisplay**

40914 The historical <control>-L command refreshed the screen exactly as it was supposed to be  
 40915 currently displayed, replacing any '@' characters for lines that had been deleted but not  
 40916 updated on the screen with refreshed '@' characters. The intent of the <control>-L command is  
 40917 to refresh when the screen has been accidentally overwritten; for example, by a **write** command  
 40918 from another user, or modem noise.

#### 40919 **Redraw Screen**

40920 The historical <control>-R command redisplayed only when necessary to update lines that had  
 40921 been deleted but not updated on the screen and that were flagged with '@' characters. There is  
 40922 no requirement that the screen be in any way refreshed if no lines of this form are currently  
 40923 displayed. IEEE Std. 1003.1-200x permits implementations to extend this command to refresh  
 40924 lines on the screen flagged with '@' characters because they are too long to be displayed in the  
 40925 current framework; however, the current line and column need not be modified.

#### 40926 **Search for tagstring**

40927 Historically, the first non-<blank> character at or after the cursor was the first character, and all  
 40928 subsequent characters that were word characters, up to the end of the line, were included. For  
 40929 example, with the cursor on the leading space or on the '#' character in the text "#bar@", the  
 40930 tag was "#bar". On the character 'b' it was "bar", and on the 'a', it was "ar".  
 40931 IEEE Std. 1003.1-200x requires this behavior.

#### 40932 **Replace Text with Results from Shell Command**

40933 Historically, the <, >, and ! commands considered most cursor motions other than line-oriented  
 40934 motions an error; for example, the command >/foo<CR> succeeded, while the command >|  
 40935 failed, even though the text region described by the two commands might be identical. For  
 40936 consistency, all three commands only consider entire lines and not partial lines, and the region is  
 40937 defined as any line that contains a character that was specified by the motion.

#### 40938 **Move to Matching Character**

40939 Other matching characters have been left implementation-dependent in order to allow  
 40940 extensions such as matching '<' and '>' for searching HTML, or **#ifdef**, **#else**, and **#endif** for  
 40941 searching C source.

## Repeat Substitution

IEEE Std. 1003.1-200x requires that any **c** and **g** flags specified to the previous substitute command be ignored; however, the **r** flag may still apply, if supported by the implementation.

## Return to Previous (Context or Section)

The **[[**, **]]**, **(**, **)**, **{**, and **}** commands are all affected by “section boundaries”, but in some historical implementations not all of the commands recognize the same section boundaries. This is a bug, not a feature, and a unique section-boundary algorithm was not described for each command. One special case that is preserved is that the sentence command moves to the end of the last line of the edit buffer while the other commands go to the beginning, in order to preserve the traditional character cut semantics of the sentence command. Historically, *vi* section boundaries at the beginning and end of the edit buffer were the first non-<blank> character on the first and last lines of the edit buffer if one exists; otherwise, the last character of the first and last lines of the edit buffer if one exists. To increase consistency with other section locations, this has been simplified by IEEE Std. 1003.1-200x to the first character of the first and last lines of the edit buffer, or the first and the last lines of the edit buffer if they are empty.

Sentence boundaries were problematic in the historical *vi*. They were not only the boundaries as defined for the section and paragraph commands, but they were the first non-<blank> character that occurred after those boundaries, as well. Historically, the *vi* section commands were documented as taking an optional window size as a *count* preceding the command. This was not implemented in historical versions, so IEEE Std. 1003.1-200x requires that the *count* repeat the command, for consistency with other *vi* commands.

## Repeat

Historically, mapped commands other than text input commands could not be repeated using the **period** command. IEEE Std. 1003.1-200x requires conformance to historical practice.

The restrictions on the interpretation of special characters (for example, <control>-H) in the repetition of text input mode commands is intended to match historical practice. For example, given the input sequence:

```
iab<control>-H<control>-H<control>-Hdef<escape>
```

the user should be informed of an error when the sequence is first entered, but not during a command repetition. The character <control>-T is specifically exempted from this restriction. Historical implementations of *vi* ignored <control>-T characters that were input in the original command during command repetition. IEEE Std. 1003.1-200x prohibits this behavior.

## Find Regular Expression

Historically, commands did not affect the line searched to or from if the motion command was a search (**/**, **?**, **N**, **n**) and the final position was the start/end of the line. There were some special cases and *vi* was not consistent. IEEE Std. 1003.1-200x does not permit this behavior, for consistency. Historical implementations permitted, but were unable to handle searches as motion commands that wrapped (that is, due to the edit option **wrapsan**) to the original location. IEEE Std. 1003.1-200x requires that this behavior be treated as an error.

Historically, the syntax **"/RE/0"** was used to force the command to cut text in line mode. IEEE Std. 1003.1-200x requires conformance to historical practice.

Historically, in open mode, a **z** specified to a search command redisplayed the current line instead of displaying the current screen with the current line highlighted. For consistency and simplicity of specification, IEEE Std. 1003.1-200x does not permit this behavior.

Historically, trailing **z** commands were permitted and ignored if entered as part of a search used as a motion command. For consistency and simplicity of specification, IEEE Std. 1003.1-200x does not permit this behavior.

#### Execute an **ex** Command

Historically, **vi** implementations restricted the commands that could be entered on the colon command line (for example, **append** and **change**), and some other commands were known to cause them to fail catastrophically. For consistency, IEEE Std. 1003.1-200x does not permit these restrictions. When executing an **ex** command by entering **:**, it is not possible to enter a <newline> character as part of the command because it is considered the end of the command. A different approach is to enter **ex** command mode by using the **vi Q** command (and later resuming visual mode with the **ex vi** command). In **ex** command mode, the single-line limitation does not exist. So, for example, the following is valid:

```
Q
s/break here/break\
here/
vi
```

IEEE Std. 1003.1-200x requires that, if the **ex** command overwrites any part of the screen that would be erased by a refresh, **vi** pauses for a character from the user. Historically, this character could be any character; for example, a character input by the user before the message appeared, or even a mapped character. This is probably a bug, but implementations that have tried to be more rigorous by requiring that the user enter a specific character, or that the user enter a character after the message was displayed, have been forced by user indignation back into historical behavior. IEEE Std. 1003.1-200x requires conformance to historical practice.

#### Shift Left (Right)

Refer to the Rationale for the **!** and **/** commands. Historically, the **<** and **>** commands sometimes moved the cursor to the first non-<blank> character (for example if the command was repeated or with **\_** as the motion command), and sometimes left it unchanged. IEEE Std. 1003.1-200x does not permit this inconsistency, requiring instead that the cursor always move to the first non-<blank> character. Historically, the **<** and **>** commands did not support buffer arguments, although some implementations allow the specification of an optional buffer. This behavior is neither required nor disallowed by IEEE Std. 1003.1-200x.

#### Execute

Historically, buffers could execute other buffers, and loops, infinite and otherwise, were possible. IEEE Std. 1003.1-200x requires conformance to historical practice. The *\*buffer* syntax of **ex** is not required in **vi**, because it is not historical practice and has been used in some **vi** implementations to support additional scripting languages.

Historically, **vi** only supported the **"@@"** syntax for repeating the last buffer execution. IEEE Std. 1003.1-200x requires that **vi** support the additional **ex** syntax **"@\*"** as well, for consistency.

**41025 Reverse Case**

41026 Historically, the `~` command ignored any associated *count*, and acted only on the characters in  
41027 the current line. For consistency with other *vi* commands, IEEE Std. 1003.1-200x requires that an  
41028 associated *count* act on the next *count* characters, and that the command move to subsequent  
41029 lines if warranted by *count*, to make it possible to modify large pieces of text in a reasonably  
41030 efficient manner. There exist *vi* implementations that optionally require an associated motion  
41031 command for the `~` command. Implementations supporting this functionality are encouraged to  
41032 base it on the **tildedop** edit option and handle the text regions and cursor positioning identically  
41033 to the **yank** command.

**41034 Append**

41035 Historically, *counts* specified to the **A**, **a**, **I**, and **i** commands repeated the input of the first line  
41036 *count* times, and did not repeat the subsequent lines of the input text. IEEE Std. 1003.1-200x  
41037 requires that the entire text input be repeated *count* times.

**41038 Move Backward to Preceding Word**

41039 Historically, *vi* became confused if word commands were used as motion commands in empty  
41040 files. IEEE Std. 1003.1-200x requires that this be an error. Historical implementations of *vi* had a  
41041 large number of bugs in the word movement commands, and they varied greatly in behavior in  
41042 the presence of empty lines, “words” made up of a single character, and lines containing only  
41043 <blank> characters. For consistency and simplicity of specification, IEEE Std. 1003.1-200x does  
41044 not permit this behavior.

**41045 Change to End-of-Line**

41046 Some historical implementations of the **C** command did not behave as described by  
41047 IEEE Std. 1003.1-200x when the **\$** key was remapped because they were implemented by  
41048 pushing the **\$** key onto the input queue and reprocessing it. IEEE Std. 1003.1-200x does not  
41049 permit this behavior. Historically, the **C**, **S**, and **s** commands did not copy replaced text into the  
41050 numeric buffers. For consistency and simplicity of specification, IEEE Std. 1003.1-200x requires  
41051 that they behave like their respective **c** commands in all respects.

**41052 Delete**

41053 Historically, lines in open mode that were deleted were scrolled up, and an @ glyph written over  
41054 the beginning of the line. In the case of terminals that are incapable of the necessary cursor  
41055 motions, the editor erased the deleted line from the screen. IEEE Std. 1003.1-200x requires  
41056 conformance to historical practice; that is, if the terminal cannot display the '@' character, the  
41057 line cannot remain on the screen.

**41058 Delete to End-of-Line**

41059 Some historical implementations of the **D** command did not behave as described by  
41060 IEEE Std. 1003.1-200x when the **\$** key was remapped because they were implemented by  
41061 pushing the **\$** key onto the input queue and reprocessing it. IEEE Std. 1003.1-200x does not  
41062 permit this behavior.

41063 **Join**

41064 An historical oddity of *vi* is that the commands **J**, **1J**, and **2J** are all equivalent.  
 41065 IEEE Std. 1003.1-200x requires conformance to historical practice. The *vi* **J** command is specified  
 41066 in terms of the *ex* **join** command with an *ex* command *count* value. The address correction for a  
 41067 *count* that is past the end of the edit buffer is necessary for historical compatibility for both *ex*  
 41068 and *vi*.

41069 **Mark Position**

41070 Historical practice is that only lowercase letters, plus `'''` and `'''`, could be used to mark a  
 41071 cursor position. IEEE Std. 1003.1-200x requires conformance to historical practice, but  
 41072 encourages implementations to support other characters as marks as well.

41073 **Repeat Regular Expression Find (Forward and Reverse)**

41074 Historically, the **N** and **n** commands could not be used as motion components for the **c**  
 41075 command. With the exception of the **cN** command, which worked if the search crossed a line  
 41076 boundary, the text region would be discarded, and the user would not be in text input mode. For  
 41077 consistency and simplicity of specification, IEEE Std. 1003.1-200x does not permit this behavior.

41078 **Insert Empty Line (Below and Above)**

41079 Historically, counts to the **O** and **o** commands were used as the number of physical lines to  
 41080 open, if the terminal was dumb and the **slowopen** option was not set. This was intended to  
 41081 minimize traffic over slow connections and repainting for dumb terminals. IEEE Std. 1003.1-200x  
 41082 does not permit this behavior, requiring that a *count* to the open command behave as for other  
 41083 text input commands. This change to historical practice was made for consistency, and because a  
 41084 superset of the functionality is provided by the **slowopen** edit option.

41085 **Put from Buffer (Following and Before)**

41086 Historically, *counts* to the **p** and **P** commands were ignored if the buffer was a line mode buffer,  
 41087 but were (mostly) implemented as described in IEEE Std. 1003.1-200x if the buffer was a  
 41088 character mode buffer. Because implementations exist that do not have this limitation, and  
 41089 because pasting lines multiple times is generally useful, IEEE Std. 1003.1-200x requires that *count*  
 41090 be supported for all **p** and **P** commands.

41091 Historical implementations of *vi* were widely known to have major problems in the **p** and **P**  
 41092 commands, particularly when unusual regions of text were copied into the edit buffer. The  
 41093 standard developers viewed these as bugs, and they are not permitted for consistency and  
 41094 simplicity of specification.

41095 Historically, a **P** or **p** command (or an *ex* **put** command executed from open or visual mode)  
 41096 executed in an empty file, left an empty line as the first line of the file. For consistency and  
 41097 simplicity of specification,  $\zeta$ A does not permit this behavior.

41098 **Replace Character**

41099 Historically, the **r** command did not correctly handle the *erase* and *word erase* characters as  
 41100 arguments, nor did it handle an associated *count* greater than 1 with a <carriage-return>  
 41101 character argument, for which it replaced *count* characters with a single <newline> character.  
 41102 IEEE Std. 1003.1-200x does not permit these inconsistencies.

41103 Historically, the **r** command permitted the <control>-V escaping of entered characters, such as  
 41104 <ESC> and the <carriage-return> character; however, it required two leading <control>-V  
 41105 characters instead of one. IEEE Std. 1003.1-200x requires that this be changed for consistency

41106 with the other text input commands of *vi*.

41107 Historically, it is an error to enter the **r** command if there are less than *count* characters at or after  
 41108 the cursor in the line. While a reasonable and unambiguous extension would be to permit the **r**  
 41109 command on empty lines, it would require that too large a *count* be adjusted to match the  
 41110 number of characters at or after the cursor for consistency, which is sufficiently different from  
 41111 historical practice to be avoided. IEEE Std. 1003.1-200x requires conformance to historical  
 41112 practice.

#### 41113 **Replace Characters**

41114 Historically, if there were **autoindent** characters in the line on which the **R** command was run,  
 41115 and **autoindent** was set, the first <newline> character would be properly indented and no  
 41116 characters would be replaced by the <newline> character. Each additional <newline> character  
 41117 would replace *n* characters, where *n* was the number of characters that were needed to indent  
 41118 the rest of the line to the proper indentation level. This behavior is a bug and is not permitted by  
 41119 IEEE Std. 1003.1-200x.

#### 41120 **Undo**

41121 Historical practice for cursor positioning after undoing commands was mixed. In most cases,  
 41122 when undoing commands that affected a single line, the cursor was moved to the start of added  
 41123 or changed text, or immediately after deleted text. However, if the user had moved from the line  
 41124 being changed, the column was either set to the first non-<blank> character, returned to the  
 41125 origin of the command, or remained unchanged. When undoing commands that affected  
 41126 multiple lines or entire lines, the cursor was moved to the first character in the first line restored.  
 41127 As an example of how inconsistent this was, a search, followed by an **o** text input command,  
 41128 followed by an **undo** would return the cursor to the location where the **o** command was entered,  
 41129 but a **cw** command followed by an **o** command followed by an **undo** would return the cursor to  
 41130 the first non-<blank> character of the line. IEEE Std. 1003.1-200x requires the most useful of  
 41131 these behaviors, and discards the least useful, in the interest of consistency and simplicity of  
 41132 specification.

#### 41133 **Yank**

41134 Historically, the **yank** command did not move to the end of the motion if the motion was in the  
 41135 forward direction. It moved to the end of the motion if the motion was in the backward  
 41136 direction, except for the **\_** command, or for the **G** and **'** commands when the end of the motion  
 41137 was on the current line. This was further complicated by the fact that for a number of motion  
 41138 commands, the **yank** command moved the cursor but did not update the screen; for example, a  
 41139 subsequent command would move the cursor from the end of the motion, even though the  
 41140 cursor on the screen had not reflected the cursor movement for the **yank** command.  
 41141 IEEE Std. 1003.1-200x requires that all **yank** commands associated with backward motions move  
 41142 the cursor to the end of the motion for consistency, and specifically, to make **'** commands as  
 41143 motions consistent with search patterns as motions.

41144 **Yank Current Line**

41145 Some historical implementations of the **Y** command did not behave as described by  
 41146 IEEE Std. 1003.1-200x when the `'_'` key was remapped because they were implemented by  
 41147 pushing the `'_'` key onto the input queue and reprocessing it. IEEE Std. 1003.1-200x does not  
 41148 permit this behavior.

41149 **Redraw Window**

41150 Historically, the **z** command always redrew the screen. This is permitted but not required by  
 41151 IEEE Std. 1003.1-200x, because of the frequent use of the **z** command in macros such as **map n**  
 41152 **nz**, for screen positioning, instead of its use to change the screen size. The standard developers  
 41153 believed that expanding or scrolling the screen offered a better interface for users. The ability to  
 41154 redraw the screen is preserved if the optional new window size is specified, and in the  
 41155 `<control>-L` and `<control>-R` commands.

41156 The semantics of **z^** are confusing at best. Historical practice is that the screen before the screen  
 41157 that ended with the specified line is displayed. IEEE Std. 1003.1-200x requires conformance to  
 41158 historical practice.

41159 Historically, the **z** command would not display a partial line at the top or bottom of the screen. If  
 41160 the partial line would normally have been displayed at the bottom of the screen, the command  
 41161 worked, but the partial line was replaced with `'@'` characters. If the partial line would normally  
 41162 have been displayed at the top of the screen, the command would fail. For consistency and  
 41163 simplicity of specification, IEEE Std. 1003.1-200x does not permit this behavior.

41164 Historically, the **z** command with a line specification of 1 ignored the command. For consistency  
 41165 and simplicity of specification, IEEE Std. 1003.1-200x does not permit this behavior.

41166 Historically, the **z** command did not set the cursor column to the first non-`<blank>` character for  
 41167 the character if the first screen was to be displayed, and was already displayed. For consistency  
 41168 and simplicity of specification, IEEE Std. 1003.1-200x does not permit this behavior.

41169 **Input Mode Commands in vi**

41170 Historical implementations of **vi** did not permit the the user to erase more than a single line of  
 41171 input, or to use normal erase characters such as *line erase*, *worderase*, and *erase* to erase  
 41172 **autoindent** characters. As there exist implementations of **vi** that do not have these limitations,  
 41173 both behaviors are permitted, but only historical practice is required. In the case of these  
 41174 extensions, **vi** is required to pause at the **autoindent** and previous line boundaries.

41175 Historical implementations of **vi** updated only the portion of the screen where the current cursor  
 41176 character was displayed. For example, consider the **vi** input keystrokes:

41177 `iabcd<escape>0C<tab>`

41178 Historically, the `<tab>` character would overwrite the characters `"abcd"` when it was displayed.  
 41179 Other implementations replace only the `'a'` character with the `<tab>` character, and then push  
 41180 the rest of the characters ahead of the cursor. Both implementations have problems. The  
 41181 historical implementation is probably visually nicer for the above example; however, for the  
 41182 keystrokes:

41183 `iabcd<ESC>0R<tab><ESC>`

41184 the historical implementation results in the string `"bcd"` disappearing and then magically  
 41185 reappearing when the `<ESC>` character is entered. IEEE Std. 1003.1-200x requires the former  
 41186 behavior when overwriting erase-columns; that is, overwriting characters that are no longer  
 41187 logically part of the edit buffer, and the latter behavior otherwise.

41188 Historical implementations of *vi* discarded the <control>-D and <control>-T characters when  
 41189 they were entered at places where their command functionality was not appropriate.  
 41190 IEEE Std. 1003.1-200x requires that the <control>-T functionality always be available, and that  
 41191 <control>-D be treated as any other key when not operating on **autoindent** characters.

## 41192 NUL

41193 Some historical implementations of *vi* limited the number of characters entered using the NUL  
 41194 input character to 256 bytes. IEEE Std. 1003.1-200x permits this limitation; however,  
 41195 implementations are encouraged to remove this limit.

## 41196 <control>-D

41197 See also Rationale for the input mode command <newline>. The hidden assumptions in the  
 41198 <control>-D command (and in the *vi* **autoindent** specification in general) is that <space>  
 41199 characters take up a single column on the screen and that <tab> characters are comprised of an  
 41200 integral number of <space> characters.

## 41201 <newline>

41202 Implementations are permitted to rewrite **autoindent** characters in the line when <newline>,  
 41203 <carriage-return>, <control>-D, and <control>-T are entered, or when the **shift** commands are  
 41204 used, because historical implementations have both done so and found it necessary to do so. For  
 41205 example, a <control>-D when the cursor is preceded by a single <tab> character, with **tabstop**  
 41206 set to 8, and **shiftwidth** set to 3, will result in the <tab> character being replaced by several  
 41207 <space> characters.

## 41208 <control>-T

41209 See also the Rationale for the input mode command <newline>. Historically, <control>-T only  
 41210 worked if no non-<blank> characters had yet been input in the current input line. In addition,  
 41211 the characters inserted by <control>-T were treated as **autoindent** characters, and could not be  
 41212 erased using normal user erase characters. Because implementations exist that do not have  
 41213 these limitations, and as moving to a column boundary is generally useful, IEEE Std. 1003.1-200x  
 41214 requires that both limitations be removed.

## 41215 <control>-V

41216 Historically, *vi* used ^V, regardless of the value of the literal-next character of the terminal.  
 41217 IEEE Std. 1003.1-200x requires conformance to historical practice.

41218 The uses described for <control>-V can also be accomplished with <control>-Q, which is useful  
 41219 on terminals that use <control>-V for the down-arrow function. However, most historical  
 41220 implementations use <control>-Q for the *termios* START character, so the editor will generally  
 41221 not receive the <control>-Q unless **stty ixon** mode is set to off. (In addition, some historical  
 41222 implementations of *vi* explicitly set **ixon** mode to on, so it was difficult for the user to set it to  
 41223 off.) Any of the command characters described in IEEE Std. 1003.1-200x can be made ineffective  
 41224 by their selection as *termios* control characters, using the *stty* utility or other methods described  
 41225 in the System Interfaces volume of IEEE Std. 1003.1-200x.

|       |                                                                                                       |  |
|-------|-------------------------------------------------------------------------------------------------------|--|
| 41226 | <ESC>                                                                                                 |  |
| 41227 | Historically, SIGINT alerted the terminal when used to end input mode. This behavior is               |  |
| 41228 | permitted, but not required, by IEEE Std. 1003.1-200x.                                                |  |
| 41229 | <b>FUTURE DIRECTIONS</b>                                                                              |  |
| 41230 | None.                                                                                                 |  |
| 41231 | <b>SEE ALSO</b>                                                                                       |  |
| 41232 | <i>ex</i> , <i>stty</i>                                                                               |  |
| 41233 | <b>CHANGE HISTORY</b>                                                                                 |  |
| 41234 | First released in Issue 2.                                                                            |  |
| 41235 | <b>Issue 4</b>                                                                                        |  |
| 41236 | Aligned with the ISO/IEC 9945-2: 1993 standard.                                                       |  |
| 41237 | <b>Issue 5</b>                                                                                        |  |
| 41238 | FUTURE DIRECTIONS section added.                                                                      |  |
| 41239 | <b>Issue 6</b>                                                                                        |  |
| 41240 | This utility is now marked as part of the User Portability Utilities option.                          |  |
| 41241 | The APPLICATION USAGE section is added.                                                               |  |
| 41242 | The obsolescent SYNOPSIS is removed.                                                                  |  |
| 41243 | The following new requirements on POSIX implementations derive from alignment with the                |  |
| 41244 | Single UNIX Specification:                                                                            |  |

| 41246 | <ul style="list-style-type: none"> <li>• The <b>reindent</b> command description is added.</li> </ul> |  |
| 41247 | The <i>vi</i> utility has been extensively rewritten for alignment with the IEEE P1003.2b draft       |  |
| 41248 | standard.                                                                                             |  |

41249 **NAME**

41250           wait — await process completion

41251 **SYNOPSIS**41252           wait [*pid*...]41253 **DESCRIPTION**

41254           When an asynchronous list (see Section 2.9.3.1 on page 74) is started by the shell, the process ID  
 41255           of the last command in each element of the asynchronous list shall become known in the current  
 41256           shell execution environment; see Section 2.12 on page 90.

41257           If the *wait* utility is invoked with no operands, it shall wait until all process IDs known to the  
 41258           invoking shell have terminated and exit with a zero exit status.

41259           If one or more *pid* operands are specified that represent known process IDs, the *wait* utility shall  
 41260           wait until all of them have terminated. If one or more *pid* operands are specified that represent  
 41261           unknown process IDs, *wait* shall treat them as if they were known process IDs that exited with  
 41262           exit status 127. The exit status returned by the *wait* utility shall be the exit status of the process  
 41263           requested by the last *pid* operand.

41264           The known process IDs are applicable only for invocations of *wait* in the current shell execution  
 41265           environment.

41266 **OPTIONS**

41267           None.

41268 **OPERANDS**

41269           The following operand shall be supported:

41270           *pid*           One of the following:

41271                           1. The unsigned decimal integer process ID of a command, for which the utility  
 41272                           is to wait for the termination.

41273                           2. A job control job ID (see the System Interface Definitions volume of  
 41274                           IEEE Std. 1003.1-200x, Section 3.207, Job Control Job ID) that identifies a  
 41275                           background process group to be waited for. The job control job ID notation is  
 41276                           applicable only for invocations of *wait* in the current shell execution  
 41277                           environment; see Section 2.12 on page 90. The exit status of *wait* shall be  
 41278                           determined by the last command in the pipeline.

41279                           **Note:**       The job control job ID type of *pid* is only available on systems  
 41280                           supporting the User Portability Utilities option.

41281 **STDIN**

41282           Not used.

41283 **INPUT FILES**

41284           None.

41285 **ENVIRONMENT VARIABLES**41286           The following environment variables shall affect the execution of *wait*:

41287           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 41288                           If *LANG* is unset or null, the corresponding value from the implementation-  
 41289                           dependent default locale shall be used. If any of the internationalization variables  
 41290                           contains an invalid setting, the utility shall behave as if none of the variables had  
 41291                           been defined.

41292 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 41293 internationalization variables.

41294 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 41295 characters (for example, single-byte as opposed to multi-byte characters in  
 41296 arguments).

41297 **LC\_MESSAGES**  
 41298 Determine the locale that should be used to affect the format and contents of  
 41299 diagnostic messages written to standard error.

41300 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

41301 **ASYNCHRONOUS EVENTS**  
 41302 Default.

41303 **STDOUT**  
 41304 Not used.

41305 **STDERR**  
 41306 Used only for diagnostic messages.

41307 **OUTPUT FILES**  
 41308 None.

41309 **EXTENDED DESCRIPTION**  
 41310 None.

41311 **EXIT STATUS**  
 41312 If one or more operands were specified, all of them have terminated or were not known by the  
 41313 invoking shell, and the status of the last operand specified is known, then the exit status of *wait*  
 41314 shall be the exit status information of the command indicated by the last operand specified. If  
 41315 the process terminated abnormally due to the receipt of a signal, the exit status shall be greater  
 41316 than 128 and shall be distinct from the exit status generated by other signals, but the exact value  
 41317 is unspecified. (See the *kill -l* option.) Otherwise, the *wait* utility shall exit with one of the  
 41318 following values:

41319 0 The *wait* utility was invoked with no operands and all process IDs known by the  
 41320 invoking shell have terminated.

41321 1-126 The *wait* utility detected an error.

41322 127 The command identified by the last *pid* operand specified is unknown.

41323 **CONSEQUENCES OF ERRORS**  
 41324 Default.

41325 **APPLICATION USAGE**  
 41326 On most implementations, *wait* is a shell built-in. If it is called in a subshell or separate utility  
 41327 execution environment, such as one of the following:

41328 (wait)  
 41329 nohup wait ...  
 41330 find . -exec wait ... \;

41331 it returns immediately because there are no known process IDs to wait for in those  
 41332 environments.

41333 Historical implementations of interactive shells have discarded the exit status of terminated  
 41334 background processes before each shell prompt. Therefore, the status of background processes  
 41335 was usually lost unless it terminated while *wait* was waiting for it. This could be a serious

problem when a job that was expected to run for a long time actually terminated quickly with a syntax or initialization error because the exit status returned was usually zero if the requested process ID was not found. This volume of IEEE Std. 1003.1-200x requires the implementation to keep the status of terminated jobs available until the status is requested, so that scripts like:

```

41340 j1&
41341 p1=$!
41342 j2&
41343 wait $p1
41344 echo Job 1 exited with status $?
41345 wait $!
41346 echo Job 2 exited with status $?

```

works without losing status on any of the jobs. The shell is allowed to discard the status of any process that it determines the application cannot get the process ID from the shell. It is also required to remember only {CHILD\_MAX} number of processes in this way. Since the only way to get the process ID from the shell is by using the '!' shell parameter, the shell is allowed to discard the status of an asynchronous list if "\$!" was not referenced before another asynchronous list was started. (This means that the shell only has to keep the status of the last asynchronous list started if the application did not reference "\$!". If the implementation of the shell is smart enough to determine that a reference to "\$!" was not saved anywhere that the application can retrieve it later, it can use this information to trim the list of saved information. Note also that a successful call to *wait* with no operands discards the exit status of all asynchronous lists.)

If the exit status of *wait* is greater than 128, there is no way for the application to know if the waited-for process exited with that value or was killed by a signal. Since most utilities exit with small values, there is seldom any ambiguity. Even in the ambiguous cases, most applications just need to know that the asynchronous job failed; it does not matter whether it detected an error and failed or was killed and did not complete its job normally.

#### 41363 EXAMPLES

Although the exact value used when a process is terminated by a signal is unspecified, if it is known that a signal terminated a process, a script can still reliably figure out which signal using *kill* as shown by the following script:

```

41367 sleep 1000&
41368 pid=$!
41369 kill -kill $pid
41370 wait $pid
41371 echo $pid was terminated by a SIG$(kill -l $?) signal.

```

If the following sequence of commands is run in less than 31 seconds:

```

41373 sleep 257 | sleep 31 &
41374 jobs -l %%

```

either of the following commands returns the exit status of the second *sleep* in the pipeline:

```

41376 wait <pid of sleep 31>
41377 wait %%

```

#### 41378 RATIONALE

The description of *wait* does not refer to the *waitpid()* function from the System Interfaces volume of IEEE Std. 1003.1-200x because that would needlessly overspecify this interface. However, the wording means that *wait* is required to wait for an explicit process when it is given an argument so that the status information of other processes is not consumed. Historical

41383 implementations use The *wait()* function defined in the System Interfaces volume of  
41384 IEEE Std. 1003.1-200x until *wait()* returns the requested process ID or finds that the requested  
41385 process does not exist. Because this means that a shell script could not reliably get the status of  
41386 all background children if a second background job was ever started before the first job finished,  
41387 it is recommended that the *wait* utility use a method such as the functionality provided by the  
41388 *waitpid()* function.

41389 The ability to wait for multiple *pid* operands was adopted from the KornShell.

41390 This new functionality was added because it is needed to determine the exit status of any  
41391 asynchronous list accurately. The only compatibility problem that this change creates is for a  
41392 script like

```
41393 while sleep 60 do
41394 job& echo Job started $(date) as $! done
```

41395 which causes the shell to monitor all of the jobs started until the script terminates or runs out of  
41396 memory. This would not be a problem if the loop did not reference "\$!" or if the script would  
41397 occasionally *wait* for jobs it started.

#### 41398 **FUTURE DIRECTIONS**

41399 None.

#### 41402 **CHANGE HISTORY**

41403 First released in Issue 2.

#### 41404 **Issue 4**

41405 Aligned with the ISO/IEC 9945-2: 1993 standard.

41406 **NAME**

41407           wc — word, line, and byte or character count

41408 **SYNOPSIS**41409           wc [-c|-m][-lw][*file...*]41410 **DESCRIPTION**41411           The *wc* utility shall read one or more input files and, by default, write the number of <newline>  
41412 characters, words, and bytes contained in each input file to the standard output.41413           The utility also shall write a total count for all named files, if more than one input file is  
41414 specified.41415           The *wc* utility shall consider a *word* to be a non-zero-length string of characters delimited by  
41416 white space.41417 **OPTIONS**41418           The *wc* utility shall conform to the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
41419 Section 12.2, Utility Syntax Guidelines.

41420           The following options shall be supported:

41421           **-c**           Write to the standard output the number of bytes in each input file.41422           **-l**           Write to the standard output the number of <newline> characters in each input  
41423 file.41424           **-m**           Write to the standard output the number of characters in each input file.41425           **-w**           Write to the standard output the number of words in each input file.41426           When any option is specified, *wc* shall report only the information requested by the specified  
41427 options.41428 **OPERANDS**

41429           The following operand shall be supported:

41430           *file*           A path name of an input file. If no *file* operands are specified, the standard input  
41431 shall be used.41432 **STDIN**41433           The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
41434 section.41435 **INPUT FILES**

41436           The input files may be of any type.

41437 **ENVIRONMENT VARIABLES**41438           The following environment variables shall affect the execution of *wc*:41439           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
41440           If *LANG* is unset or null, the corresponding value from the implementation-  
41441 dependent default locale shall be used. If any of the internationalization variables  
41442 contains an invalid setting, the utility shall behave as if none of the variables had  
41443 been defined.41444           **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
41445 internationalization variables.41446           **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
41447 characters (for example, single-byte as opposed to multi-byte characters in  
41448 arguments and input files) and which characters are defined as white space

- 41449 characters.
- 41450 **LC\_MESSAGES**
- 41451 Determine the locale that should be used to affect the format and contents of
- 41452 diagnostic messages written to standard error and informative messages written to
- 41453 standard output.
- 41454 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.
- 41455 **ASYNCHRONOUS EVENTS**
- 41456 Default.
- 41457 **STDOUT**
- 41458 By default, the standard output shall contain an entry for each input file of the form:
- 41459 "%d %d %d %s\n", <newlines>, <words>, <bytes>, <file>
- 41460 If the **-m** option is specified, the number of characters shall replace the <bytes> field in this
- 41461 format.
- 41462 If any options are specified and the **-l** option is not specified, the number of <newline>
- 41463 characters shall not be written.
- 41464 If any options are specified and the **-w** option is not specified, the number of words shall not be
- 41465 written.
- 41466 If any options are specified and neither **-c** nor **-m** is specified, the number of bytes or characters
- 41467 shall not be written.
- 41468 If no input *file* operands are specified, no name shall be written and no <blank> characters
- 41469 preceding the path name shall be written.
- 41470 If more than one input *file* operand is specified, an additional line shall be written, of the same
- 41471 format as the other lines, except that the word **total** (in the POSIX locale) shall be written instead
- 41472 of a path name and the total of each column shall be written as appropriate. Such an additional
- 41473 line, if any, is written at the end of the output.
- 41474 **STDERR**
- 41475 Used only for diagnostic messages.
- 41476 **OUTPUT FILES**
- 41477 None.
- 41478 **EXTENDED DESCRIPTION**
- 41479 None.
- 41480 **EXIT STATUS**
- 41481 The following exit values shall be returned:
- 41482 0 Successful completion.
- 41483 >0 An error occurred.
- 41484 **CONSEQUENCES OF ERRORS**
- 41485 Default.

**41486 APPLICATION USAGE**

41487       The **-m** option is not a switch, but an option at the same level as **-c**. Thus, to produce the full  
41488       default output with character counts instead of bytes, the command required is:

41489       wc -mlw

**41490 EXAMPLES**

41491       None.

**41492 RATIONALE**

41493       The output file format pseudo-*printf()* string differs from the the System V version of *wc*:

41494       "%7d%7d%7d %s\n"

41495       which produces possibly ambiguous and unparsable results for very large files, as it assumes no  
41496       number shall exceed six digits.

41497       Some historical implementations use only <space>, <tab>, and <newline> as word separators.  
41498       The equivalent of the ISO C standard *isspace()* function is more appropriate.

41499       The **-c** option stands for “character” count, even though it counts bytes. This stems from the  
41500       sometimes erroneous historical view that bytes and characters are the same size. Due to  
41501       international requirements, the **-m** option (reminiscent of “multi-byte”) was added to obtain  
41502       actual character counts.

41503       Early proposals only specified the results when input files were text files. The current  
41504       specification more closely matches historical practice. (Bytes, words, and <newline>s are  
41505       counted separately and the results are written when an end-of-file is detected.)

41506       Historical implementations of the *wc* utility only accepted one argument to specify the options  
41507       **-c**, **-l**, and **-w**. Some of them also had multiple occurrences of an option cause the  
41508       corresponding count to be written multiple times and had the order of specification of the  
41509       options affect the order of the fields on output, but did not document either of these. Because  
41510       common usage either specifies no options or only one option, and because none of this was  
41511       documented, the changes required by this volume of IEEE Std. 1003.1-200x should not break  
41512       many historical applications (and do not break any historical portable applications).

**41513 FUTURE DIRECTIONS**

41514       None.

**41515 SEE ALSO**

41516       *cksum*

**41517 CHANGE HISTORY**

41518       First released in Issue 2.

**41519 Issue 4**

41520       Aligned with the ISO/IEC 9945-2: 1993 standard.

41521 **NAME**41522           what — identify SCCS files (**DEVELOPMENT**)41523 **SYNOPSIS**41524 XSI        what [-s] *file...*

41525

41526 **DESCRIPTION**

41527       The *what* utility shall search the given files for all occurrences of the pattern that *get* (see *get* on  
 41528       page 510) substitutes for %Z% ("@( # ) ") and shall write to standard output what follows until  
 41529       the first occurrence of one of the following:

41530           "     &gt;     newline     \     NUL

41531 **OPTIONS**

41532       The *what* utility shall conform to the System Interface Definitions volume of  
 41533       IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

41534       The following option is supported:

41535       -s           Quit after finding the first occurrence of the pattern in each file.

41536 **OPERANDS**

41537       The following operands shall be supported:

41538       *file*           A path name of a file to search.41539 **STDIN**

41540       Not used.

41541 **INPUT FILES**

41542       The input files are of any file type.

41543 **ENVIRONMENT VARIABLES**41544       The following environment variables shall affect the execution of *what*:

41545       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 41546                       If *LANG* is unset or null, the corresponding value from the implementation-  
 41547                       dependent default locale shall be used. If any of the internationalization variables  
 41548                       contains an invalid setting, the utility shall behave as if none of the variables had  
 41549                       been defined.

41550       *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 41551                       internationalization variables.

41552       *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
 41553                       characters (for example, single-byte as opposed to multi-byte characters in  
 41554                       arguments and input files).

41555       *LC\_MESSAGES*   Determine the locale that should be used to affect the format and contents of  
 41556                       diagnostic messages written to standard error.  
 41557

41558       *NLSPATH*       Determine the location of message catalogs for the processing of *LC\_MESSAGES*.41559 **ASYNCHRONOUS EVENTS**

41560       Default.

41561 **STDOUT**

41562           The standard output shall consist of the following for each *file* operand:

41563           "%s:\n\t%s\n", <pathname>, <identification string>

41564 **STDERR**

41565           Used only for diagnostic messages.

41566 **OUTPUT FILES**

41567           None.

41568 **EXTENDED DESCRIPTION**

41569           None.

41570 **EXIT STATUS**

41571           The following exit values shall be returned:

41572           0    Any matches were found.

41573           1    Otherwise.

41574 **CONSEQUENCES OF ERRORS**

41575           Default.

41576 **APPLICATION USAGE**

41577           The *what* utility is intended to be used in conjunction with the SCCS command *get*, which automatically inserts identifying information, but it can also be used where the information is inserted by any other means.

41580           When the string "@(#)" is included in a library routine in a shared library, it might not be found in an **a.out** file using that library routine.

41582 **EXAMPLES**

41583           If the C-language program in file **f.c** contains:

41584           char ident[] = "@(#)identification information";

41585           and **f.c** is compiled to yield **f.o** and **a.out**, then the command:

41586           what f.c f.o a.out

41587           writes:

41588           f.c:

41589               identification information

41590               ...

41591           f.o:

41592               identification information

41593               ...

41594           a.out:

41595               identification information

41596               ...

41597 **RATIONALE**

41598           None.

41599 **FUTURE DIRECTIONS**

41600           None.

41601 **SEE ALSO**41602 *get*41603 **CHANGE HISTORY**

41604 First released in Issue 2.

41608 Internationalized environment variable support mandated.

## 41609 NAME

41610       who — display who is on the system

## 41611 SYNOPSIS

41612 UP       who [-mTu]

41613

41614 XSI       who [-mu]-s[-bHlprt][*file*]

41615       who [-mTu][-abdHlprt][*file*]

41616       who -q [*file*]

41617       who am i

41618       who am I

41619

## 41620 DESCRIPTION

41621       The *who* utility shall list various pieces of information about accessible users. The domain of  
41622 accessibility is implementation-dependent.

41623 XSI       Based on the options given, *who* can also list the user's name, terminal line, login time, elapsed  
41624 time since activity occurred on the line, and the process ID of the command interpreter for each  
41625 current system user.

## 41626 OPTIONS

41627       The *who* utility shall conform to the System Interface Definitions volume of  
41628 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

41629       The following options shall be supported. The metavariables, such as *<line>*, refer to fields  
41630 described in the STDOUT section.

41631 XSI       **-a**       Process the implementation-dependent database or named file with the **-b**, **-d**, **-l**,  
41632       **-p**, **-r**, **-t**, **-T** and **-u** options turned on.

41633 XSI       **-b**       Write the time and date of the last reboot.

41634 XSI       **-d**       Write a list of all processes that have expired and not been respawned by the *init*  
41635 system process. The *<exit>* field appears for dead processes and contains the  
41636 termination and exit values of the dead process. This can be useful in determining  
41637 why a process terminated.

41638 XSI       **-H**       Write column headings above the regular output.

41639 XSI       **-l**       (The letter ell.) List only those lines on which the system is waiting for someone to  
41640 login. The *<name>* field is **LOGIN** in such cases. Other fields are the same as for  
41641 user entries except that the *<state>* field does not exist.

41642       **-m**       Output only information about the current terminal.

41643 XSI       **-p**       List any other process that is currently active and has been previously spawned by  
41644 *init*.

41645 XSI       **-q**       (Quick.) List only the names and the number of users currently logged on. When  
41646 this option is used, all other options are ignored.

41647 XSI       **-r**       Write the current *run-level* of the *init* process.

41648 XSI       **-s**       List only the *<name>*, *<line>*, and *<time>* fields. This is the default case.

41649 XSI       **-t**       Indicate the last change to the system clock.

41650           **-T**           Show the state of each terminal, as described in the STDOUT section.

41651 XSI       **-u**           This option lists only those users who are currently logged in. Output the user's  
 41652                           "idle time" in addition to any other information. The idle time is the time since  
 41653                           any activity occurred on the user's terminal. The method of determining this is  
 41654 XSI                       unspecified. The *<name>* is the user's login name. The *<line>* is the name of the line  
 41655                           as found in the directory */dev*. The *<time>* is the time that the user logged in. The  
 41656                           *<activity>* is the number of hours and minutes since activity last occurred on that  
 41657                           particular line. A dot indicates that the terminal has seen activity in the last minute  
 41658                           and is therefore "current". If more than twenty-four hours have elapsed or the line  
 41659                           has not been used since boot time, the entry is marked *<old>*. This field is useful  
 41660                           when trying to determine whether a person is working at the terminal or not. The  
 41661                           *<pid>* is the process ID of the user's login process.

#### 41662 OPERANDS

41663 XSI       The following operands shall be supported:

41664           **am i, am I**   In the POSIX locale, limit the output to describing the invoking user, equivalent to  
 41665                           the **-m** option. The **am** and **i** or **I** must be separate arguments.

41666           **file**       Specify a path name of a file to substitute for the implementation-dependent  
 41667                           database of logged-on users that *who* uses by default.

#### 41668 STDIN

41669           Not used.

#### 41670 INPUT FILES

41671           None.

#### 41672 ENVIRONMENT VARIABLES

41673           The following environment variables shall affect the execution of *who*:

41674           **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 41675                           If **LANG** is unset or null, the corresponding value from the implementation-  
 41676                           dependent default locale shall be used. If any of the internationalization variables  
 41677                           contains an invalid setting, the utility shall behave as if none of the variables had  
 41678                           been defined.

41679           **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 41680                           internationalization variables.

41681           **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 41682                           characters (for example, single-byte as opposed to multi-byte characters in  
 41683                           arguments).

41684           **LC\_MESSAGES**   Determine the locale that should be used to affect the format and contents of  
 41685                           diagnostic messages written to standard error.  
 41686                           

41687           **LC\_TIME**     Determine the locale used for the format and contents of the date and time strings.

41688 XSI       **NLSPATH**   Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

#### 41689 ASYNCHRONOUS EVENTS

41690           Default.

41691 **STDOUT**

41692 XSI OF XSI-conformant systems shall write the default information to the standard output in the  
 41693 following general format:

41694 `<name>[<state>]<line><time>[<activity>][<pid>][<comment>][<exit>]`

41695 The following format shall be used for the **-T** option:

41696 `"%s %c %s %s\n" <name>, <terminal state>, <terminal name>,  
 41697 <time of login>`

41698 where *<terminal state>* is one of the following characters:

- 41699 + The terminal allows write access to other users.
- 41700 – The terminal denies write access to other users.
- 41701 ? The terminal write-access state cannot be determined.

41702 In the POSIX locale, the *<time of login>* shall be equivalent in format to the output of:

41703 `date +"%b %e %H:%M"`

41704 If the **-u** option is used with **-T**, the idle time shall be added to the end of the previous format in  
 41705 an unspecified format.

41706 **STDERR**

41707 Used only for diagnostic messages.

41708 **OUTPUT FILES**

41709 None.

41710 **EXTENDED DESCRIPTION**

41711 None.

41712 **EXIT STATUS**

41713 The following exit values shall be returned:

- 41714 0 Successful completion.
- 41715 >0 An error occurred.

41716 **CONSEQUENCES OF ERRORS**

41717 Default.

41718 **APPLICATION USAGE**

41719 The name *init* used for the system process is the most commonly used on historical systems, but  
 41720 it may vary.

41721 The “domain of accessibility” referred to is a broad concept that permits interpretation either on  
 41722 a very secure basis or even to allow a network-wide implementation like the historical *rwwho*.

41723 Application writers should note that this utility need not be provided on systems that do not  
 41724 support the User Portability Utilities option.

41725 **EXAMPLES**

41726 None.

41727 **RATIONALE**

41728 Due to differences between historical implementations, the base options provided were a  
 41729 compromise to allow users to work with those functions. The standard developers also  
 41730 considered removing all the options, but felt that these options offered users valuable  
 41731 functionality. Additional options to match historical systems are available on XSI-conformant

- 41732 systems.
- 41733 It is recognized that the *who* command may be of limited usefulness, especially in a multi-level  
41734 secure environment. The standard developers considered, however, that having some standard  
41735 method of determining the “accessibility” of other users would aid user portability.
- 41736 No format was specified for the default *who* output for systems not supporting the XSI  
41737 Extension. In such a user-oriented command, designed only for human use, this was not  
41738 considered to be a deficiency.
- 41739 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, and *write* require  
41740 that they use the same format.
- 41741 **FUTURE DIRECTIONS**
- 41742 None.
- 41743 **SEE ALSO**
- 41744 *mesg*
- 41745 **CHANGE HISTORY**
- 41746 First released in Issue 2.
- 41747 **Issue 4**
- 41748 Aligned with the ISO/IEC 9945-2: 1993 standard.
- 41749 **Issue 6**
- 41750 This utility is now marked as part of the User Portability Utilities option.

## 41751 NAME

41752 write — write to another user

## 41753 SYNOPSIS

41754 UP write *user\_name* [*terminal*]

41755

## 41756 DESCRIPTION

41757 The *write* utility shall read lines from the user's standard input and write them to the terminal of  
 41758 another user. When first invoked, it shall write the message:

41759 **Message from** *sender-login-id* (*sending-terminal*) [*date*]...

41760 to *user\_name*. When it has successfully completed the connection, the sender's terminal shall be  
 41761 alerted twice to indicate that what the sender is typing is being written to the recipient's  
 41762 terminal.

41763 If the recipient wants to reply, this can be accomplished by typing:

41764 write *sender-login-id* [*sending-terminal*]

41765 upon receipt of the initial message. Whenever a line of input as delimited by a NL, EOF, or EOL  
 41766 special character (see the System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter  
 41767 11, General Terminal Interface) is accumulated while in canonical input mode, the accumulated  
 41768 data shall be written on the other user's terminal. Characters shall be processed as follows:

- 41769 • Typing the <alert> character shall write the alert character to the recipient's terminal.
- 41770 • Typing the erase and kill characters shall affect the sender's terminal in the manner described  
 41771 by the **termios** interface in the System Interface Definitions volume of IEEE Std. 1003.1-200x,  
 41772 Chapter 11, General Terminal Interface.
- 41773 • Typing the interrupt or end-of-file characters shall cause *write* to write an appropriate  
 41774 message ("EOT\n" in the POSIX locale) to the recipient's terminal and exit.
- 41775 • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those characters  
 41776 to be sent to the recipient's terminal.
- 41777 • When and only when the *stty ixten* local mode is enabled, the existence and processing of  
 41778 additional special control characters and multi-byte or single-byte functions is  
 41779 implementation-dependent.
- 41780 • Typing other non-printable characters shall cause implementation-dependent sequences of  
 41781 printable characters to be written to the recipient's terminal.

41782 To write to a user who is logged in more than once, the *terminal* argument can be used to indicate  
 41783 which terminal to write to; otherwise, the recipient's terminal is selected in an implementation-  
 41784 dependent manner and an informational message is written to the sender's standard output,  
 41785 indicating which terminal was chosen.

41786 Permission to be a recipient of a *write* message can be denied or granted by use of the *mesg*  
 41787 utility. However, a user's privilege may further constrain the domain of accessibility of other  
 41788 users' terminals. The *write* utility shall fail when the user lacks the appropriate privileges to  
 41789 perform the requested action.

## 41790 OPTIONS

41791 None.

41792 **OPERANDS**

41793 The following operands shall be supported:

41794 *user\_name* Login name of the person to whom the message shall be written. The application  
 41795 shall ensure that this operand is of the form returned by the *who* utility.

41796 *terminal* Terminal identification in the same format provided by the *who* utility.

41797 **STDIN**

41798 Lines to be copied to the recipient's terminal is read from standard input.

41799 **INPUT FILES**

41800 None.

41801 **ENVIRONMENT VARIABLES**41802 The following environment variables shall affect the execution of *write*:

41803 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 41804 If *LANG* is unset or null, the corresponding value from the implementation-  
 41805 dependent default locale shall be used. If any of the internationalization variables  
 41806 contains an invalid setting, the utility shall behave as if none of the variables had  
 41807 been defined.

41808 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 41809 internationalization variables.

41810 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 41811 characters (for example, single-byte as opposed to multi-byte characters in  
 41812 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
 41813 equivalent to the sender's, the results are undefined.

41814 *LC\_MESSAGES*

41815 Determine the locale that should be used to affect the format and contents of  
 41816 diagnostic messages written to standard error and informative messages written to  
 41817 standard output.

41818 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

41819 **ASYNCHRONOUS EVENTS**

41820 If an interrupt signal is received, *write* shall write an appropriate message on the recipient's  
 41821 terminal and exits with a status of zero. It shall take the standard action for all other signals.

41822 **STDOUT**

41823 An informational message shall be written to standard output if a recipient is logged in more  
 41824 than once.

41825 **STDERR**

41826 Used only for diagnostic messages.

41827 **OUTPUT FILES**

41828 The recipient's terminal is used for output.

41829 **EXTENDED DESCRIPTION**

41830 None.

41831 **EXIT STATUS**

41832 The following exit values shall be returned:

41833 0 Successful completion.

41834 >0 The addressed user is not logged on or the addressed user denies permission.

41835 **CONSEQUENCES OF ERRORS**

41836 Default.

41837 **APPLICATION USAGE**

41838 The *talk* utility is considered by some users to be a more usable utility on full-screen terminals.

41839 Application writers should note that this utility need not be provided on systems that do not  
41840 support the User Portability Utilities option.

41841 **EXAMPLES**

41842 None.

41843 **RATIONALE**

41844 The *write* utility was included in this volume of IEEE Std. 1003.1-200x since it can be  
41845 implemented on all terminal types. The standard developers considered the *talk* utility, which  
41846 cannot be implemented on certain terminals, to be a “better” communications interface. Both of  
41847 these programs are in widespread use on historical implementations. Therefore, the standard  
41848 developers decided that both utilities should be specified.

41849 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
41850 require that they all use or accept the same format.

41851 **FUTURE DIRECTIONS**

41852 None.

41853 **SEE ALSO**

41854 *mesg*, *talk*, *who*, the System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 11,  
41855 General Terminal Interface

41856 **CHANGE HISTORY**

41857 First released in Issue 2.

41858 **Issue 4**

41859 Aligned with the ISO/IEC 9945-2: 1993 standard.

41860 **Issue 5**

41861 FUTURE DIRECTIONS section added.

41862 **Issue 6**

41863 This utility is now marked as part of the User Portability Utilities option.

41864 The normative text is reworded to avoid use of the term “must” for application requirements.

41865 **NAME**41866 **xargs** — construct argument lists and invoke utility41867 **SYNOPSIS**

```
41868 xsi xargs [-t][-p][-E eofstr][-I replstr][-L number][-n number [-x]]
```

```
41869 [-s size][utility [argument...]]
```

41870 **DESCRIPTION**

41871 The *xargs* utility shall construct a command line consisting of the *utility* and *argument* operands  
 41872 specified followed by as many arguments read in sequence from standard input as fit in length  
 41873 and number constraints specified by the options. The *xargs* utility shall then invoke the  
 41874 constructed command line and wait for its completion. This sequence shall be repeated until one  
 41875 of the following occurs:

- 41876 • An end-of-file condition is detected on standard input.
- 41877 • The logical end-of-file string (see the *-E eofstr* option) is found on standard input after  
 41878 double-quote processing, apostrophe processing, and backslash escape processing (see next  
 41879 paragraph).
- 41880 • An invocation of a constructed command line returns an exit status of 255.

41881 The application shall ensure that arguments in the standard input are separated by unquoted  
 41882 <blank> characters, or unescaped <blank> characters or <newline> characters. A string of zero  
 41883 or more non-double-quote ( ' ) ' and non-<newline> characters can be quoted by enclosing  
 41884 them in double-quotes. A string of zero or more non-apostrophe ( ' ' ' ) and non-<newline>  
 41885 characters can be quoted by enclosing them in apostrophes. Any unquoted character can be  
 41886 escaped by preceding it with a backslash. The utility shall be executed one or more times until  
 41887 the end-of-file is reached or the logical end-of file string is found. The results are unspecified if  
 41888 the utility named by *utility* attempts to read from its standard input.

41889 The generated command line length shall be the sum of the size in bytes of the utility name and  
 41890 each argument treated as strings, including a null byte terminator for each of these strings. The  
 41891 *xargs* utility shall limit the command line length such that when the command line is invoked,  
 41892 the combined argument and environment lists (see the *exec* family of functions in the System  
 41893 Interfaces volume of IEEE Std. 1003.1-200x) shall not exceed {ARG\_MAX}-2 048 bytes. Within  
 41894 this constraint, if neither the *-n* nor the *-s* option is specified, the default command line length  
 41895 shall be at least {LINE\_MAX}.

41896 **OPTIONS**

41897 The *xargs* utility shall conform to the System Interface Definitions volume of  
 41898 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

41899 The following options shall be supported:

41900 xsi ***-E eofstr*** Use *eofstr* as the logical end-of-file string. If *-E* is not specified, it is unspecified  
 41901 whether the logical end-of-file string is the underscore character ( ' \_ ' ) or the end-  
 41902 of-file string capability is disabled. When *eofstr* is the null string, the logical end-  
 41903 of-file string capability shall be disabled and underscore characters shall be taken  
 41904 literally.

41905 xsi ***-I replstr*** Insert mode: *utility* is executed for each line from standard input, taking the entire  
 41906 line as a single argument, inserting it in *arguments* for each occurrence of *replstr*. A  
 41907 maximum of five arguments in *arguments* can each contain one or more instances  
 41908 of *replstr*. Any <blank> characters at the beginning of each line shall be ignored.  
 41909 Constructed arguments cannot grow larger than 255 bytes. Option *-x* is forced on.  
 41910 The *-I* and *-i* options are mutually-exclusive; the last one specified shall take  
 41911 effect.

|           |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 41912 XSI | <b>-L number</b>                           | The <i>utility</i> shall be executed for each non-empty <i>number</i> lines of arguments from standard input. The last invocation of <i>utility</i> shall be with fewer lines of arguments if fewer than <i>number</i> remain. A line is considered to end with the first <newline> character unless the last character of the line is a <blank> character; a trailing <blank> character signals continuation to the next non-empty line, inclusive. The <b>-L</b> , <b>-l</b> , and <b>-n</b> options are mutually-exclusive; the last one specified shall take effect. |
| 41913     |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 41914     |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 41915     |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 41916     |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 41946     | The following operands shall be supported: |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 41947     | <i>utility</i>                             | The name of the utility to be invoked, found by search path using the <i>PATH</i> environment variable, described in the System Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables. If <i>utility</i> is omitted, the default shall be the <i>echo</i> utility. If the <i>utility</i> operand names any of the special built-in utilities in Section 2.14 on page 96, the results are undefined.                                                                                                                                    |
| 41948     |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 41949     |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 41950     |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 41951     |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 41952     | <i>argument</i>                            | An initial option or operand for the invocation of <i>utility</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

41953 **STDIN**

41954 The standard input shall be a text file. The results are unspecified if an end-of-file condition is  
 41955 detected immediately following an escaped <newline> character.

41956 **INPUT FILES**

41957 MAN The file `/dev/tty` is used to read responses required by the `-p` option.

41958 **ENVIRONMENT VARIABLES**

41959 The following environment variables shall affect the execution of *xargs*:

41960 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 41961 If *LANG* is unset or null, the corresponding value from the implementation-  
 41962 dependent default locale shall be used. If any of the internationalization variables  
 41963 contains an invalid setting, the utility shall behave as if none of the variables had  
 41964 been defined.

41965 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 41966 internationalization variables.

41967 *LC\_COLLATE*

41968 Determine the locale for the behavior of ranges, equivalence classes and multi-  
 41969 character collating elements used in the extended regular expression defined for  
 41970 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

41971 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 41972 characters (for example, single-byte as opposed to multi-byte characters in  
 41973 arguments and input files) and the behavior of character classes used in the  
 41974 extended regular expression defined for the **yesexpr** locale keyword in the  
 41975 *LC\_MESSAGES* category.

41976 *LC\_MESSAGES*

41977 Determine the locale for the processing of affirmative responses and that should be  
 41978 used to affect the format and contents of diagnostic messages written to standard  
 41979 error.

41980 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

41981 *PATH* Determine the location of *utility*, as described in the System Interface Definitions  
 41982 volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables.

41983 **ASYNCHRONOUS EVENTS**

41984 Default.

41985 **STDOUT**

41986 Not used.

41987 **STDERR**

41988 MAN Used for diagnostic messages and the `-t` and `-p` options. If the `-t` option is specified, the *utility*  
 41989 and its constructed argument list shall be written to standard error, as it will be invoked, prior to  
 41990 MAN invocation. If `-p` is specified, a prompt of the following format shall be written (in the POSIX  
 41991 locale):

41992 " . . . "

41993 at the end of the line of the output from `-t`.

41994 **OUTPUT FILES**

41995       None.

41996 **EXTENDED DESCRIPTION**

41997       None.

41998 **EXIT STATUS**

41999       The following exit values shall be returned:

- 42000           0    All invocations of *utility* returned exit status zero.
- 42001           1-125   A command line meeting the specified requirements could not be assembled, one or more of the invocations of *utility* returned a non-zero exit status, or some other error occurred.
- 42002
- 42003
- 42004           126   The utility specified by *utility* was found but could not be invoked.
- 42005           127   The utility specified by *utility* could not be found.

42006 **CONSEQUENCES OF ERRORS**

42007       If a command line meeting the specified requirements cannot be assembled, the utility cannot be invoked, an invocation of the utility is terminated by a signal, or an invocation of the utility exits with exit status 255, the *xargs* utility shall write a diagnostic message and exit without processing any remaining input.

42008

42009

42010

42011 **APPLICATION USAGE**

42012       The 255 exit status allows a utility being used by *xargs* to tell *xargs* to terminate if it knows no further invocations using the current data stream succeeds. Thus, *utility* should explicitly *exit* with an appropriate value to avoid accidentally returning with 255.

42013

42014

42015       Note that input is parsed as lines; <blank> characters separate arguments. If *xargs* is used to bundle output of commands like *find dir -print* or *ls* into commands to be executed, unexpected results are likely if any file names contain any <blank> characters or <newline> characters. This can be fixed by using *find* to call a script that converts each file found into a quoted string that is then piped to *xargs*. Note that the quoting rules used by *xargs* are not the same as in the shell. They were not made consistent here because existing applications depend on the current rules and the shell syntax is not fully compatible with it. An easy rule that can be used to transform any string into a quoted form that *xargs* interprets correctly is to precede each character in the string with a backslash.

42016

42017

42018

42019

42020

42021

42022

42023

42024       On implementations with a large value for {ARG\_MAX}, *xargs* may produce command lines longer than {LINE\_MAX}. For invocation of utilities, this is not a problem. If *xargs* is being used to create a text file, users should explicitly set the maximum command line length with the *-s* option.

42025

42026

42027

42028       The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if an error occurs so that applications can distinguish “failure to find a utility” from “invoked utility exited with an error indication”. The value 127 was chosen because it is not commonly used for other meanings; most utilities use small values for “normal error conditions” and the values above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could be found, but not invoked. Some scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for any other reason.

42037

## 42038 EXAMPLES

42039 1. The following moves all files from directory **\$1** to directory **\$2**, and echo each move  
 42040 command just before doing it:

42041 `ls $1 | xargs -I {} -t mv $1/{} $2/{} |`

42042 2. The following command combines the output of the parenthesised commands onto one  
 42043 line, which is then written to the end-of-file **log**:

42044 `(logname; date; printf "%s\n" "$0 $*") | xargs >>log`

42045 3. The following command invokes *diff* with successive pairs of arguments originally typed  
 42046 as command line arguments (assuming there are no embedded <blank> characters in the  
 42047 elements of the original argument list):

42048 `printf "%s\n" "$*" | xargs -n 2 -x diff`

42049 4. The user is asked which files in the current directory shall be archived. The files are  
 42050 archived into **arch**; *a*, one at a time, or *b*, many at a time.

42051 `a. ls | xargs -p -L 1 ar -r arch`

42052 `b. ls | xargs -p -L 1 | xargs ar -r arch`

42053 5. The following executes with successive pairs of arguments originally typed as command  
 42054 line arguments:

42055 `echo $* | xargs -n 2 diff`

## 42056 RATIONALE

42057 The *xargs* utility was usually found only in System V-based systems; BSD systems included an  
 42058 *apply* utility that provided functionality similar to *xargs -n number*. The SVID lists *xargs* as a  
 42059 software development extension. This volume of IEEE Std. 1003.1-200x does not share the view  
 42060 that it is used only for development, and therefore it is not optional.

42061 The classic application of the *xargs* utility is in conjunction with the *find* utility to reduce the  
 42062 number of processes launched by a simplistic use of the *find-exec* combination. The *xargs* utility  
 42063 is also used to enforce an upper limit on memory required to launch a process. With this basis in  
 42064 mind, this volume of IEEE Std. 1003.1-200x selected only the minimal features required.

42065 The *-n number* option was used classically to evoke a utility using pairs of operands, yet the  
 42066 general case has problems when *utility* spawns child processes of its own. The *xargs* utility can  
 42067 sap resources from these children, especially those sharing the environment of the parent.

42068 The *command*, *env*, *nohup*, and *xargs* utilities have been specified to use exit code 127 if an error  
 42069 occurs so that applications can distinguish “failure to find a utility” from “invoked utility exited  
 42070 with an error indication”. The value 127 was chosen because it is not commonly used for other  
 42071 meanings; most utilities use small values for “normal error conditions”, and the values above  
 42072 128 can be confused with termination due to receipt of a signal. The value 126 was chosen in a  
 42073 similar manner to indicate that the utility could be found, but not invoked. Some scripts produce  
 42074 meaningful error messages differentiating the 126 and 127 cases. The distinction between exit  
 42075 codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to *exec* the  
 42076 utility fail with [ENOENT] and that uses 126 when any attempt to *exec* the utility fails for any  
 42077 other reason.

42078 Although the 255 exit status is mostly an accident of historical implementations, it allows a  
 42079 utility being used by *xargs* to tell *xargs* to terminate if it knows no further invocations using the  
 42080 current data stream shall succeed. Any non-zero exit status from a utility falls into the 1-125  
 42081 range when *xargs* exits. There is no statement of how the various non-zero utility exit status

codes are accumulated by *xargs*. The value could be the addition of all codes, their highest value, the last one received, or a single value such as 1. Since no algorithm is arguably better than the others, and since many of the standard utilities say little more (portably) than “pass/fail”, no new algorithm was invented.

Several other *xargs* options were withdrawn because simple alternatives already exist within this volume of IEEE Std. 1003.1-200x. For example, the *-e eofstr* option can be replaced by features of *sed*. The *-i replstr* option can be just as efficiently performed using a shell *for* loop. Since *xargs* calls an *exec* function with each input line, the *-i* option does not usually exploit the grouping capabilities of *xargs*.

The requirement that *xargs* never produce command lines such that invocation of *utility* is within 2 048 bytes of hitting the POSIX *exec* {ARG\_MAX} limitations is intended to guarantee that the invoked utility has room to modify its environment variables and command line arguments and still be able to invoke another utility. Note that the minimum {ARG\_MAX} allowed by the System Interfaces volume of IEEE Std. 1003.1-200x is 4 096 bytes and the minimum value allowed by the this volume of IEEE Std. 1003.1-200x is 2 048 bytes; therefore, the 2 048 bytes difference seems reasonable. Note, however, that *xargs* may never be able to invoke a utility if the environment passed in to *xargs* comes close to using {ARG\_MAX} bytes.

The version of *xargs* required by this volume of IEEE Std. 1003.1-200x is required to wait for the completion of the invoked command before invoking another command. This was done because historical scripts using *xargs* assumed sequential execution. Implementations wanting to provide parallel operation of the invoked utilities are encouraged to add an option enabling parallel invocation, but should still wait for termination of all of the children before *xargs* terminates normally.

The *-e* option was omitted from the ISO POSIX-2:1993 standard in the belief that the *eofstr* option-argument was recognized only when it was on a line by itself and before quote and escape processing were performed, and that the logical end-of-file processing was only enabled if a *-e* option was specified. In that case, a simple *sed* script could be used to duplicate the *-e* functionality. Further investigation revealed that:

- The logical end-of-file string was checked for after quote and escape processing, making a *sed* script that provided equivalent functionality much more difficult to write.
- The default was to perform logical end-of-file processing with an underscore as the logical end-of-file string.

To correct this misunderstanding, the *-E eofstr* option was adopted from Issue 4 in an amendment to IEEE Std. 1003.1-200x. Users should note that the description of the *-E* option matches historical documentation of the *-e* option (which was not adopted because it did not support the Utility Syntax Guidelines), by saying that if *eofstr* is the null string, logical end-of-file processing is disabled. Historical implementations of *xargs* actually did not disable logical end-of-file processing; they treated a null argument found in the input as a logical end-of-file string. (A null *string* argument could be generated using single or double quotes ( ' ' or " "). Since this behavior was not documented historically, it is considered to be a bug.

## FUTURE DIRECTIONS

A version supporting the Utility Syntax Guidelines may be introduced.

## SEE ALSO

42126 **CHANGE HISTORY**

42127 First released in Issue 2.

42128 **Issue 4**

42129 Aligned with the ISO/IEC 9945-2: 1993 standard.

42130 **Issue 5**

42131 Second FUTURE DIRECTION added.

42132 **Issue 6**42133 The obsolescent **-e**, **-i**, and **-l** options are removed.42134 The following new requirements on POSIX implementations derive from alignment with the  
42135 Single UNIX Specification:

- 42136 • The **-p** option is added.
- 42137 • In the INPUT FILES section, the file **/dev/tty** is used to read responses required by the **-p**  
42138 option.
- 42139 • The STDERR section is updated to describe the **-p** option.

42140 The description of the **-E** option is aligned with the ISO POSIX-2: 1993 standard. |

42141 The normative text is reworded to avoid use of the term “must” for application requirements. |

## 42142 NAME

42143 yacc — yet another compiler compiler (DEVELOPMENT)

## 42144 SYNOPSIS

42145 yacc [-dltv][*-b file\_prefix*][*-p sym\_prefix*] *grammar*

## 42146 DESCRIPTION

42147 The *yacc* utility shall read a description of a context-free grammar in *file* and write C source code,  
 42148 conforming to the ISO C standard, to a code file, and optionally header information into a  
 42149 header file, in the current directory. The C code shall define a function and related routines and  
 42150 macros for an automaton that executes a parsing algorithm meeting the requirements in  
 42151 **Algorithms** on page 1119.

42152 The form and meaning of the grammar are described in the EXTENDED DESCRIPTION section.

42153 The C source code and header file shall be produced in a form suitable as input for the C  
 42154 compiler (see *c89* on page 246).

## 42155 OPTIONS

42156 The *yacc* utility shall conform to the System Interface Definitions volume of  
 42157 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

42158 The following options shall be supported:

42159 **-b *file\_prefix*** Use *file\_prefix* instead of *y* as the prefix for all output file names. The code file  
 42160 *y.tab.c*, the header file *y.tab.h* (created when **-d** is specified), and the description  
 42161 file *y.output* (created when **-v** is specified), shall be changed to *file\_prefix.tab.c*,  
 42162 *file\_prefix.tab.h*, and *file\_prefix.output*, respectively.

42163 **-d** Write the header file; by default only the code file is written. The **#define**  
 42164 statements that associate the token codes assigned by *yacc* with the user-declared  
 42165 token names. This allows source files other than *y.tab.c* to access the token codes.

42166 **-l** Produce a code file that does not contain any **#line** constructs. If this option is not  
 42167 present, it is unspecified whether the code file or header file contains **#line**  
 42168 directives. This should only be used after the grammar and the associated actions  
 42169 are fully debugged.

42170 **-p *sym\_prefix*** Use *sym\_prefix* instead of *yy* as the prefix for all external names produced by *yacc*.  
 42171 The names affected shall include the functions *yyparse*, *yylex*, and *yyerror*, and the  
 42172 variables *yylval*, *yychar*, and *yydebug*. (In the remainder of this section, the six  
 42173 symbols cited are referenced using their default names only as a notational  
 42174 convenience.) Local names may also be affected by the **-p** option; however, the **-p**  
 42175 option shall not affect **#define** symbols generated by *yacc*.

42176 **-t** Modify conditional compilation directives to permit compilation of debugging  
 42177 code in the code file. Runtime debugging statements shall always be contained in  
 42178 the code file, but by default conditional compilation directives prevent their  
 42179 compilation.

42180 **-v** Write a file containing a description of the parser and a report of conflicts  
 42181 generated by ambiguities in the grammar.

## 42182 OPERANDS

42183 The following operand is required:

42184 *grammar* A path name of a file containing instructions, hereafter called *grammar*, for which a  
 42185 parser is to be created. The format for the grammar is described in the EXTENDED  
 42186 DESCRIPTION section.

**42187 STDIN**

42188 Not used.

**42189 INPUT FILES**

42190 The file *grammar* shall be a text file formatted as specified in the EXTENDED DESCRIPTION  
42191 section.

**42192 ENVIRONMENT VARIABLES**

42193 The following environment variables shall affect the execution of *yacc*:

42194 **LANG** Provide a default value for the internationalization variables that are unset or null.  
42195 If *LANG* is unset or null, the corresponding value from the implementation-  
42196 dependent default locale shall be used. If any of the internationalization variables  
42197 contains an invalid setting, the utility shall behave as if none of the variables had  
42198 been defined.

42199 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
42200 internationalization variables.

42201 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
42202 characters (for example, single-byte as opposed to multi-byte characters in  
42203 arguments and input files).

**42204 LC\_MESSAGES**

42205 Determine the locale that should be used to affect the format and contents of  
42206 diagnostic messages written to standard error.

42207 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

42208 The *LANG* and *LC\_\** variables affect the execution of the *yacc* utility as stated. The *main* function  
42209 defined in **Yacc Library** on page 1119 shall call:

42210 `setlocale(LC_ALL, " ")`

42211 and thus, the program generated by *yacc* also shall be affected by the contents of these variables  
42212 at runtime.

**42213 ASYNCHRONOUS EVENTS**

42214 Default.

**42215 STDOUT**

42216 Not used.

**42217 STDERR**

42218 If shift/reduce or reduce/reduce conflicts are detected in *grammar*, *yacc* writes a report of those  
42219 conflicts to the standard error in an unspecified format.

42220 Standard error is also used for diagnostic messages.

**42221 OUTPUT FILES**

42222 The code file, the header file, and the description file shall be text files. All are described in the  
42223 following sections.

42224      **Code File**

42225      This file shall contain the C source code for the *yyparse* routine. It shall contain code for the  
 42226      various semantic actions with macro substitution performed on them as described in the  
 42227      EXTENDED DESCRIPTION section. It also shall contain a copy of the **#define** statements in the  
 42228      header file. If a **%union** declaration is used, the declaration for YYSTYPE shall be also included  
 42229      in this file.

42230      **Header File**

42231      The header file shall contain **#define** statements that associate the token numbers with the token  
 42232      names. This allows source files other than the code file to access the token codes. If a **%union**  
 42233      declaration is used, the declaration for YYSTYPE and an *extern YYSTYPE yylval* declaration shall  
 42234      be also included in this file.

42235      **Description File**

42236      The description file shall be a text file containing a description of the state machine  
 42237      corresponding to the parser, using an unspecified format. Limits for internal tables (see **Limits**  
 42238      on page 1120) shall also be reported, in an implementation-dependent manner. (Some  
 42239      implementations may use dynamic allocation techniques and have no specific limit values to  
 42240      report.)

42241      **EXTENDED DESCRIPTION**

42242      The *yacc* command accepts a language that is used to define a grammar for a target language to  
 42243      be parsed by the tables and code generated by *yacc*. The language accepted by *yacc* as a  
 42244      grammar for the target language is described below using the *yacc* input language itself.

42245      The input *grammar* includes rules describing the input structure of the target language and code  
 42246      to be invoked when these rules are recognized to provide the associated semantic action. The  
 42247      code to be executed shall appear as bodies of text that are intended to be C-language code. The  
 42248      C-language inclusions are presumed to form a correct function when processed by *yacc* into its  
 42249      output files. The code included in this way shall be executed during the recognition of the target  
 42250      language.

42251      Given a grammar, the *yacc* utility generates the files described in the OUTPUT FILES section.  
 42252      The code file can be compiled and linked using *cc* or *c89*. If the declaration and programs  
 42253      sections of the grammar file did not include definitions of *main*, *yylex*, and *yyerror*, the compiled  
 42254      output requires linking with externally supplied version of those functions. Default versions of  
 42255      *main* and *yyerror* are supplied in the *yacc* library and can be linked in by using the *-ly* operand to  
 42256      *c89*. The *yacc* library interfaces need not support interfaces with other than the default **yy**  
 42257      symbol prefix. The application provides the lexical analyzer function, *yylex*; the *lex* utility is  
 42258      specifically designed to generate such a routine.

42259      **Input Language**

42260      The application ensure that every specification file consists of three sections in order:  
 42261      *declarations*, *grammar rules*, and *programs*, separated by double percent signs ("%"). The  
 42262      declarations and programs sections can be empty. If the latter is empty, the preceding "%"   
 42263      mark separating it from the rules section can be omitted.

42264      The input is free form text following the structure of the grammar defined below.

42265      **Lexical Structure of the Grammar**

42266      The characters <blank>, <newline>, and <form-feed> shall be ignored, except that the  
 42267      application shall ensure that they do not appear in names or multi-character reserved symbols.  
 42268      Comments shall be enclosed in `"/* . . . */"`, and can appear wherever a name is valid.

42269      Names are of arbitrary length, made up of letters, periods (`'.'`), underscores (`'_'`), and non-  
 42270      initial digits. Uppercase and lowercase letters are distinct. Portable applications shall not use  
 42271      names beginning in `yy` or `YY` since the `yacc` parser uses such names. Many of the names appear  
 42272      in the final output of `yacc`, and thus they should be chosen to conform with any additional rules  
 42273      created by the C compiler to be used. In particular they appear in `#define` statements.

42274      A literal shall consist of a single character enclosed in single-quotes (`' '`). All of the escape  
 42275      sequences supported for character constants by the ISO C standard shall be supported by `yacc`.

42276      The relationship with the lexical analyzer is discussed in detail below.

42277      The application shall ensure that the NUL character is not used in grammar rules or literals.

42278      **Declarations Section**

42279      The declarations section is used to define the symbols used to define the target language and  
 42280      their relationship with each other. In particular, much of the additional information required to  
 42281      resolve ambiguities in the context-free grammar for the target language is provided here.

42282      Usually `yacc` assigns the relationship between the symbolic names it generates and their  
 42283      underlying numeric value. The declarations section makes it possible to control the assignment  
 42284      of these values.

42285      It is also possible to keep semantic information associated with the tokens currently on the parse  
 42286      stack in a user-defined C-language **union**, if the members of the union are associated with the  
 42287      various names in the grammar. The declarations section provides for this as well.

42288      The first group of declarators below all take a list of names as arguments. That list can optionally  
 42289      be preceded by the name of a C union member (called a *tag* below) appearing within `'<'` and  
 42290      `'>'`. (As an exception to the typographical conventions of the rest of this volume of  
 42291      IEEE Std. 1003.1-200x, in this case `<tag>` does not represent a metavariable, but the literal angle  
 42292      bracket characters surrounding a symbol.) The use of *tag* specifies that the tokens named on this  
 42293      line shall be of the same C type as the union member referenced by *tag*. This is discussed in  
 42294      more detail below.

42295      For lists used to define tokens, the first appearance of a given token can be followed by a  
 42296      positive integer (as a string of decimal digits). If this is done, the underlying value assigned to it  
 42297      for lexical purposes is taken to be that number.

42298      `%token [<tag>] name [number][name [number]]. . .`

42299      Declares *names* to be a token. If *tag* is present, the C type for all tokens on this line shall be  
 42300      declared to be the type referenced by *tag*. If a positive integer, *number*, follows a *name*, that  
 42301      value shall be assigned to the token.

42302      `%left [<tag>] name [number][name [number]]. . .`

42303      `%right [<tag>] name [number][name [number]]. . .`

42304      Declares *name* to be a token, and assigns precedence to it. One or more lines, each beginning  
 42305      with one of these symbols, can appear in this section. All tokens on the same line have the  
 42306      same precedence level and associativity; the lines are in order of increasing precedence or  
 42307      binding strength. `%left` denotes that the operators on that line are left associative, and  
 42308      `%right` similarly denotes right associative operators. If *tag* is present, it shall declare a C  
 42309      type for *names* as described for `%token`.

42310       %nonassoc [<tag>] *name* [*number*][*name* [*number*]]. . .  
 42311           Declares *name* to be a token, and indicates that this cannot be used associatively. If the  
 42312           parser encounters associative use of this token it reports an error. If *tag* is present, it shall  
 42313           declare a C type for *names* as described for **%token**.

42314       %type [<tag>] *name*. . .  
 42315           Declares that union member *names* are non-terminals, and thus it is required to have a *tag*  
 42316           field at its beginning. Because it deals with non-terminals only, assigning a token number or  
 42317           using a literal is also prohibited. If this construct is present, *yacc* shall perform type  
 42318           checking; if this construct is not present, the parse stack shall hold only the **int** type.

42319       Every name used in *grammar* undefined by a **%token**, **%left**, **%right**, or **%nonassoc** declaration is  
 42320       assumed to represent a non-terminal symbol. The *yacc* utility shall report an error for any non-  
 42321       terminal symbol that does not appear on the left side of at least one grammar rule.

42322       Once the type, precedence, or token number of a name is specified, it shall not be changed. If the  
 42323       first declaration of a token does not assign a token number, *yacc* shall assign a token number.  
 42324       Once this assignment is made, the token number shall not be changed by explicit assignment.

42325       The following declarators do not follow the previous pattern.

42326       %start *name*  
 42327           Declares the non-terminal *name* to be the *start symbol*, which represents the largest, most  
 42328           general structure described by the grammar rules. By default, it is the left-hand side of the  
 42329           first grammar rule; this default can be overridden with this declaration.

42330       %union { *body of union (in C)* }  
 42331           Declares the *yacc* value stack to be a union of the various types of values desired. By default,  
 42332           the values returned by actions (see below) and the lexical analyzer shall be integers. The  
 42333           *yacc* utility keeps track of types, and it shall insert corresponding union member names in  
 42334           order to perform strict type checking of the resulting parser.

42335           Alternatively, given that at least one <tag> construct is used, the union can be declared in a  
 42336           header file (which shall be included in the declarations section by using an **#include**  
 42337           construct within %{ and %}), and a **typedef** used to define the symbol YYSTYPE to  
 42338           represent this union. The effect of **%union** is to provide the declaration of YYSTYPE directly  
 42339           from the *yacc* input.

42340       %{ ... %}  
 42341           C-language declarations and definitions can appear in the declarations section, enclosed by  
 42342           these marks. These statements shall be copied into the code file, and have global scope  
 42343           within it so that they can be used in the rules and program sections.

42344       The application shall ensure that the declarations section is terminated by the token %%. |

#### 42345       **Grammar Rules in yacc**

42346       The rules section defines the context-free grammar to be accepted by the function *yacc* generates,  
 42347       and associates with those rules C-language actions and additional precedence information. The  
 42348       grammar is described below, and a formal definition follows.

42349       The rules section is comprised of one or more grammar rules. A grammar rule has the form:

42350       A : BODY ;

42351       The symbol **A** represents a non-terminal name, and **BODY** represents a sequence of zero or  
 42352       more *names*, *literals*, and *semantic actions* that can then be followed by optional *precedence rules*.  
 42353       Only the names and literals participate in the formation of the grammar; the semantic actions  
 42354       and precedence rules are used in other ways. The colon and the semicolon are *yacc* punctuation.

42355 If there are several successive grammar rules with the same left-hand side, the vertical bar ' | '   
 42356 can be used to avoid rewriting the left-hand side; in this case the semicolon appears only after   
 42357 the last rule. The BODY part can be empty (or empty of names and literals) to indicate that the   
 42358 non-terminal symbol matches the empty string.

42359 The yacc utility assigns a unique number to each rule. Rules using the vertical bar notation are   
 42360 distinct rules. The number assigned to the rule appears in the description file.

42361 The elements comprising a BODY are:

42362 *name, literal*

42363 These form the rules of the grammar: *name* is either a *token* or a *non-terminal*; *literal*   
 42364 stands for itself (less the lexically required quotation marks).

42365 *semantic action*

42366 With each grammar rule, the user can associate actions to be performed each time   
 42367 the rule is recognized in the input process. (Note that the word "action" can also   
 42368 refer to the actions of the parser—shift, reduce, and so on.)

42369 These actions can return values and can obtain the values returned by previous   
 42370 actions. These values are kept in objects of type YYSTYPE (see %union). The   
 42371 result value of the action shall be kept on the parse stack with the left-hand side of   
 42372 the rule, to be accessed by other reductions as part of their right-hand side. By   
 42373 using the <tag> information provided in the declarations section, the code   
 42374 generated by yacc can be strictly type checked and contain arbitrary information. In   
 42375 addition, the lexical analyzer can provide the same kinds of values for tokens, if   
 42376 desired.

42377 An action is an arbitrary C statement and as such can do input or output, call   
 42378 subprograms and alter external variables. An action is one or more C statements   
 42379 enclosed in curly braces ' { ' and ' } '.

42380 Certain pseudo-variables can be used in the action. These are macros for access to   
 42381 data structures known internally to yacc.

42382 \$\$ The value of the action can be set by assigning it to \$\$ . If type   
 42383 checking is enabled and the type of the value to be assigned cannot   
 42384 be determined, a diagnostic message may be generated.

42385 \$number This refers to the value returned by the component specified by the   
 42386 token *number* in the right side of a rule, reading from left to right;   
 42387 *number* can be zero or negative. If it is, it refers to the data associated   
 42388 with the name on the parser's stack preceding the leftmost symbol of   
 42389 the current rule. (That is, "\$0" refers to the name immediately   
 42390 preceding the leftmost name in the current rule, to be found on the   
 42391 parser's stack and "\$-1" refers to the symbol to *its* left.) If *number*   
 42392 refers to an element past the current point in the rule, or beyond the   
 42393 bottom of the stack, the result is undefined. If type checking is   
 42394 enabled and the type of the value to be assigned cannot be   
 42395 determined, a diagnostic message may be generated.

42396 \$<tag>number These correspond exactly to the corresponding symbols without the   
 42397 *tag* inclusion, but allow for strict type checking (and preclude   
 42398 unwanted type conversions). The effect is that the macro is expanded   
 42399 to use *tag* to select an element from the YYSTYPE union (using   
 42400 *dataname.tag*). This is particularly useful if *number* is not positive.   
 42401

|       |                                    |                                                                                                                     |
|-------|------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| 42402 | <code>\$&lt;tag&gt;\$</code>       | This imposes on the reference the type of the union member                                                          |
| 42403 |                                    | referenced by <i>tag</i> . This construction is applicable when a reference                                         |
| 42404 |                                    | to a left context value occurs in the grammar, and provides yacc with                                               |
| 42405 |                                    | a means for selecting a type.                                                                                       |
| 42406 |                                    | Actions can occur in the middle of a rule as well as at the end; an action can access                               |
| 42407 |                                    | values returned by actions to its left, and in turn the value it returns can be                                     |
| 42408 |                                    | accessed by actions to its right. An action appearing in the middle of a rule shall be                              |
| 42409 |                                    | equivalent to replacing the action with a new non-terminal symbol and adding an                                     |
| 42410 |                                    | empty rule with that non-terminal symbol on the left-hand side. The semantic                                        |
| 42411 |                                    | action associated with the new rule shall be equivalent to the original action. The                                 |
| 42412 |                                    | use of actions within rules might introduce conflicts that would not otherwise                                      |
| 42413 |                                    | exist.                                                                                                              |
| 42414 |                                    | By default, the value of a rule shall be the value of the first element in it. If the first                         |
| 42415 |                                    | element does not have a type (particularly in the case of a literal) and type                                       |
| 42416 |                                    | checking is turned on by <code>%type</code> an error message shall result.                                          |
| 42417 | <i>precedence</i>                  | The keyword <code>%prec</code> can be used to change the precedence level associated with a                         |
| 42418 |                                    | particular grammar rule. Examples of this are in cases where a unary and binary                                     |
| 42419 |                                    | operator have the same symbolic representation, but need to be given different                                      |
| 42420 |                                    | precedences, or where the handling of an ambiguous if-else construction is                                          |
| 42421 |                                    | necessary. The reserved symbol <code>%prec</code> can appear immediately after the body of                          |
| 42422 |                                    | the grammar rule and can be followed by a token name or a literal. It shall cause                                   |
| 42423 |                                    | the precedence of the grammar rule to become that of the following token name or                                    |
| 42424 |                                    | literal. The action for the rule as a whole can follow <code>%prec</code> .                                         |
| 42425 |                                    | If a program section follows, the application shall ensure that the grammar rules are terminated                    |
| 42426 |                                    | by <code>%%</code> .                                                                                                |
| 42427 | <b>Programs Section</b>            |                                                                                                                     |
| 42428 |                                    | The <i>programs</i> section can include the definition of the lexical analyzer <code>yylex()</code> , and any other |
| 42429 |                                    | functions, for example those used in the actions specified in the grammar rules. It is unspecified                  |
| 42430 |                                    | whether the programs section precedes or follows the semantic actions in the output file;                           |
| 42431 |                                    | therefore, if the application contains any macro definitions and declarations intended to apply to                  |
| 42432 |                                    | the code in the semantic actions, it shall place them within " <code>%{ . . . %}</code> " in the declarations       |
| 42433 |                                    | section.                                                                                                            |
| 42434 | <b>Input Grammar</b>               |                                                                                                                     |
| 42435 |                                    | The following input to yacc yields a parser for the input to yacc. This formal syntax takes                         |
| 42436 |                                    | precedence over the preceding text syntax description.                                                              |
| 42437 |                                    | The lexical structure is defined less precisely; <b>Lexical Structure of the Grammar</b> on page 1111               |
| 42438 |                                    | defines most terms. The correspondence between the previous terms and the tokens below is as                        |
| 42439 |                                    | follows.                                                                                                            |
| 42440 | <b>IDENTIFIER</b>                  | This corresponds to the concept of <i>name</i> , given previously. It also includes                                 |
| 42441 |                                    | literals as defined previously.                                                                                     |
| 42442 | <b>C_IDENTIFIER</b>                | This is a name, and additionally it is known to be followed by a colon. A literal                                   |
| 42443 |                                    | cannot yield this token.                                                                                            |
| 42444 | <b>NUMBER</b>                      | A string of digits (a non-negative decimal integer).                                                                |
| 42445 | <b>TYPE, LEFT, MARK, and so on</b> |                                                                                                                     |
| 42446 |                                    | These correspond directly to <code>%type</code> , <code>%left</code> , <code>%%</code> , and so on.                 |

42447            {...}            This indicates C-language source code, with the possible inclusion of '\$'  
 42448                               macros as discussed previously.

### 42449 **Notes to Reviewers**

## 42529 Conflicts

42530 The parser produced for an input grammar may contain states in which conflicts occur. The  
 42531 conflicts occur because the grammar is not LALR(1). An ambiguous grammar always contains at  
 42532 least one LALR(1) conflict. The yacc utility shall resolve all conflicts, using either default rules or  
 42533 user-specified precedence rules.

42534 Conflicts are either shift/reduce conflicts or reduce/reduce conflicts. A shift/reduce conflict is  
 42535 where, for a given state and lookahead symbol, both a shift action and a reduce action are  
 42536 possible. A reduce/reduce conflict is where, for a given state and lookahead symbol, reductions  
 42537 by two different rules are possible.

42538 The rules below describe how to specify what actions to take when a conflict occurs. Not all  
 42539 shift/reduce conflicts can be successfully resolved this way because the conflict may be due to  
 42540 something other than ambiguity, so incautious use of these facilities can cause the language

accepted by the parser to be much different from that which was intended. The description file shall contain sufficient information to understand the cause of the conflict. Where ambiguity is the reason either the default or explicit rules should be adequate to produce a working parser.

The declared precedences and associativities (see **Declarations Section** on page 1111) are used to resolve parsing conflicts as follows:

1. A precedence and associativity is associated with each grammar rule; it is the precedence and associativity of the last token or literal in the body of the rule. If the **%prec** keyword is used, it overrides this default. Some grammar rules might not have both precedence and associativity.
2. If there is a shift/reduce conflict, and both the grammar rule and the input symbol have precedence and associativity associated with them, then the conflict is resolved in favor of the action (shift or reduce) associated with the higher precedence. If the precedences are the same, then the associativity is used; left associative implies reduce, right associative implies shift, and non-associative implies an error in the string being parsed.
3. When there is a shift/reduce conflict that cannot be resolved by rule 2, the shift is done. Conflicts resolved this way are counted in the diagnostic output described in **Error Handling**.
4. When there is a reduce/reduce conflict, a reduction is done by the grammar rule that occurs earlier in the input sequence. Conflicts resolved this way are counted in the diagnostic output described in **Error Handling**.

Conflicts resolved by precedence or associativity shall not be counted in the shift/reduce and reduce/reduce conflicts reported by yacc on either standard error or in the description file.

## **Error Handling**

The token **error** shall be reserved for error handling. The name **error** can be used in grammar rules. It indicates places where the parser can recover from a syntax error. The default value of **error** shall be 256. Its value can be changed using a **%token** declaration. The lexical analyzer should not return the value of **error**. (Multi-byte characters should be recognized by the lexical analyzer and returned as tokens. They should not be returned as multi-byte character literals. The token **error** that is used for error recovery is normally assigned the value 256 in the historical implementation. Thus, the token value 256, which used in many multi-byte character sets, is not available for use as the value of a user-defined token.)

The parser shall detect a syntax error when it is in a state where the action associated with the lookahead symbol is **error**. A semantic action can cause the parser to initiate error handling by executing the macro **YYERROR**. When **YYERROR** is executed, the semantic action passes control back to the parser. **YYERROR** cannot be used outside of semantic actions.

When the parser detects a syntax error, it normally calls *yyerror* with the character string "syntax error" as its argument. The call shall not be made if the parser is still recovering from a previous error when the error is detected. The parser is considered to be recovering from a previous error until the parser has shifted over at least three normal input symbols since the last error was detected or a semantic action has executed the macro *yyerrorok*. The parser shall not call *yyerror* when **YYERROR** is executed.

The macro function **YYRECOVERING** shall return 1 if a syntax error has been detected and the parser has not yet fully recovered from it. Otherwise, zero shall be returned.

When a syntax error is detected by the parser, the parser shall check if a previous syntax error has been detected. If a previous error was detected, and if no normal input symbols have been shifted since the preceding error was detected, the parser checks if the lookahead symbol is an

42587 endmarker (see **Interface to the Lexical Analyzer**). If it is, the parser shall return with a non-  
42588 zero value. Otherwise, the lookahead symbol shall be discarded and normal parsing shall  
42589 resume.

42590 When YYERROR is executed or when the parser detects a syntax error and no previous error has  
42591 been detected, or at least one normal input symbol has been shifted since the previous error was  
42592 detected, the parser shall pop back one state at a time until the parse stack is empty or the  
42593 current state allows a shift over **error**. If the parser empties the parse stack, it shall return with a  
42594 non-zero value. Otherwise, it shall shift over **error** and then resume normal parsing. If the parser  
42595 reads a lookahead symbol before the error was detected, that symbol shall still be the lookahead  
42596 symbol when parsing is resumed.

42597 The macro *yterror* in a semantic action shall cause the parser to act as if it has fully recovered  
42598 from any previous errors. The macro *yyclearin* shall cause the parser to discard the current  
42599 lookahead token. If the current lookahead token has not yet been read, *yyclearin* shall have no  
42600 effect.

42601 The macro YYACCEPT shall cause the parser to return with the value zero. The macro  
42602 YYABORT shall cause the parser to return with a non-zero value.

### 42603 **Interface to the Lexical Analyzer**

42604 The *yylex* function is an integer-valued function that returns a *token number* representing the kind  
42605 of token read. If there is a value associated with the token returned by *yylex* (see the discussion  
42606 of *tag* above), it shall be assigned to the external variable *yylval*.

42607 If the parser and *yylex* do not agree on these token numbers, reliable communication between  
42608 them cannot occur. For (one character) literals, the token is simply the numeric value of the  
42609 character in the current character set. The numbers for other tokens can either be chosen by *yacc*,  
42610 or chosen by the user. In either case, the **#define** construct of C is used to allow *yylex* to return  
42611 these numbers symbolically. The **#define** statements are put into the code file, and the header  
42612 file if that file is requested. The set of characters permitted by *yacc* in an identifier is larger than  
42613 that permitted by C. Token names found to contain such characters shall not be included in the  
42614 **#define** declarations.

42615 If the token numbers are chosen by *yacc*, the tokens other than literals shall be assigned numbers  
42616 greater than 256, although no order is implied. A token can be explicitly assigned a number by  
42617 following its first appearance in the declarations section with a number. Names and literals not  
42618 defined this way retain their default definition. All token numbers assigned by *yacc* shall be  
42619 unique and distinct from the token numbers used for literals and user-assigned tokens. If  
42620 duplicate token numbers cause conflicts in parser generation, *yacc* shall report an error;  
42621 otherwise, it is unspecified whether the token assignment is accepted or an error is reported.

42622 The end of the input is marked by a special token called the *endmarker*, which has a token  
42623 number that is zero or negative. (These values are invalid for any other token.) All lexical  
42624 analyzers shall return zero or negative as a token number upon reaching the end of their input. If  
42625 the tokens up to, but excluding, the endmarker form a structure that matches the start symbol,  
42626 the parser shall accept the input. If the endmarker is seen in any other context, it shall be  
42627 considered an error.

## 42628 **Completing the Program**

42629 In addition to *yyparse* and *yylex*, the functions *yyerror* and *main* are required to make a complete  
 42630 program. The application can supply *main* and *yyerror*, or those routines can be obtained from  
 42631 the *yacc* library.

## 42632 **Yacc Library**

42633 The following functions appear only in the *yacc* library accessible through the `-ly` operand to *cc*  
 42634 or *c89*; they can therefore be redefined by a portable application:

### 42635 **int main(void)**

42636 This function shall call *yyparse* and exit with an unspecified value. Other actions within this  
 42637 function are unspecified.

### 42638 **int yyerror(const char \*s)**

42639 This function shall write the NUL-terminated argument to standard error, followed by a  
 42640 <newline> character.

42641 The order of the `-ly` and `-ll` operands given to *cc* or *c89* is significant; the application shall  
 42642 either provide its own *main* function or ensure that `-ly` precedes `-ll`.

## 42643 **Debugging the Parser**

42644 The parser generated by *yacc* shall have diagnostic facilities in it that can be optionally enabled  
 42645 at either compile time or at runtime (if enabled at compile time). The compilation of the runtime  
 42646 debugging code is under the control of *YYDEBUG*, a preprocessor symbol. If *YYDEBUG* has a  
 42647 non-zero value, the debugging code shall be included. If its value is zero, the code shall not be  
 42648 included.

42649 In parsers where the debugging code has been included, the external **int** *yydebug* can be used to  
 42650 turn debugging on (with a non-zero value) and off (zero value) at runtime. The initial value of  
 42651 *yydebug* shall be zero.

42652 When `-t` is specified, the code file shall be built such that, if *YYDEBUG* is not already defined at  
 42653 compilation time (using the *c89* `-D YYDEBUG` option, for example), *YYDEBUG* shall be set  
 42654 explicitly to 1. When `-t` is not specified, the code file shall be built such that, if *YYDEBUG* is not  
 42655 already defined, it shall be set explicitly to zero.

42656 The format of the debugging output is unspecified but includes at least enough information to  
 42657 determine the shift and reduce actions, and the input symbols. It also provides information  
 42658 about error recovery.

## 42659 **Algorithms**

42660 The parser constructed by *yacc* implements an LALR(1) parsing algorithm as documented in the  
 42661 literature. It is unspecified whether the parser is table-driven or direct-coded.

42662 A parser generated by *yacc* shall never request an input symbol from *yylex* while in a state where  
 42663 the only actions other than the error action are reductions by a single rule.

42664 The literature of parsing theory defines these concepts.

**Limits**

The yacc utility may have several internal tables. The minimum maximums for these tables are shown in the following table. The exact meaning of these values is implementation-dependent. The implementation shall define the relationship between these values and between them and any error messages that the implementation may generate should it run out of space for any internal structure. An implementation may combine groups of these resources into a single pool as long as the total available to the user does not fall below the sum of the sizes specified by this section.

**Table 4-22** Internal Limits in yacc

| Limit      | Minimum<br>Maximum | Description                                                                                                                                                                                                                                             |
|------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {NTERMS}   | 126                | Number of tokens.                                                                                                                                                                                                                                       |
| {NNONTERM} | 200                | Number of non-terminals.                                                                                                                                                                                                                                |
| {NPROD}    | 300                | Number of rules.                                                                                                                                                                                                                                        |
| {NSTATES}  | 600                | Number of states.                                                                                                                                                                                                                                       |
| {MEMSIZE}  | 5 200              | Length of rules. The total length, in names (tokens and non-terminals), of all the rules of the grammar. The left-hand side is counted for each rule, even if it is not explicitly repeated, as specified in <b>Grammar Rules in yacc</b> on page 1112. |
| {ACTSIZE}  | 4 000              | Number of actions. “Actions” here (and in the description file) refer to parser actions (shift, reduce, and so on) not to semantic actions defined in <b>Grammar Rules in yacc</b> on page 1112.                                                        |

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

If any errors are encountered, the run is aborted and yacc exits with a non-zero status. Partial code files and header files may be produced. The summary information in the description file always shall be produced if the **-v** flag is present.

**APPLICATION USAGE**

Historical implementations experience name conflicts on the names **yacc.tmp**, **yacc.acts**, **yacc.debug**, **y.tab.c**, **y.tab.h**, and **y.output** if more than one copy of yacc is running in a single directory at one time. The **-b** option was added to overcome this problem. The related problem of allowing multiple yacc parsers to be placed in the same file was addressed by adding a **-p** option to override the previously hard-coded yy variable prefix.

The description of the **-p** option specifies the minimal set of function and variable names that cause conflict when multiple parsers are linked together. YYSTYPE does not need to be changed. Instead, the programmer can use **-b** to give the header files for different parsers different names, and then the file with the yylex for a given parser can include the header for that parser. Names such as **yyclearerr** do not need to be changed because they are used only in the actions; they do not have linkage. It is possible that an implementation has other names, either internal ones for implementing things such as **yyclearerr**, or providing non-standard features that it wants to change with **-p**.

42712 Unary operators that are the same token as a binary operator in general need their precedence  
 42713 adjusted. This is handled by the **%prec** advisory symbol associated with the particular grammar  
 42714 rule defining that unary operator. (See **Grammar Rules in yacc** on page 1112.) Applications are  
 42715 not required to use this operator for unary operators, but the grammars that do not require it are  
 42716 rare.

#### 42717 EXAMPLES

42718 Access to the *yacc* library is obtained with library search operands to *cc* or *c89*. To use the *yacc*  
 42719 library *main*:

```
42720 c89 y.tab.c -l y
```

42721 Both the *lex* library and the *yacc* library contain *main*. To access the *yacc main*:

```
42722 c89 y.tab.c lex.yy.c -l y -l l
```

42723 This ensures that the *yacc* library is searched first, so that its *main* is used.

42724 The historical *yacc* libraries have contained two simple functions that are normally coded by the  
 42725 application programmer. These library functions are similar to the following code:

```
42726 #include <locale.h>
42727 int main(void)
42728 {
42729 extern int yyparse();
42730 setlocale(LC_ALL, "");
42731 /* If the following parser is one created by lex, the
42732 application must be careful to ensure that LC_CTYPE
42733 and LC_COLLATE are set to the POSIX locale. */
42734 (void) yyparse();
42735 return (0);
42736 }
42737 #include <stdio.h>
42738 int yyerror(const char *msg)
42739 {
42740 (void) fprintf(stderr, "%s\n", msg);
42741 return (0);
42742 }
```

#### 42743 RATIONALE

42744 The references in **Referenced Documents** on page xv may be helpful in constructing the parser  
 42745 generator. The referenced DeRemer, Frank, and Pennello Article (along with the works it  
 42746 references) describes a technique to generate parsers that conform to this volume of  
 42747 IEEE Std. 1003.1-200x. Work in this area continues to be done, so implementors should consult  
 42748 current literature before doing any new implementations. The original Knuth Article is the  
 42749 theoretical basis for this kind of parser, but the tables it generates are impractically large for  
 42750 reasonable grammars and should not be used. The “equivalent to” wording is intentional to  
 42751 assure that the best tables that are LALR(1) can be generated.

42752 There has been confusion between the class of grammars, the algorithms needed to generate  
 42753 parsers, and the algorithms needed to parse the languages. They are all reasonably orthogonal.  
 42754 In particular, a parser generator that accepts the full range of LR(1) grammars need not generate  
 42755 a table any more complex than one that accepts SLR(1) (a relatively weak class of LR grammars)  
 42756 for a grammar that happens to be SLR(1). Such an implementation need not recognize the case,  
 42757 either; table compression can yield the SLR(1) table (or one even smaller than that) without

recognizing that the grammar is SLR(1). The speed of an LR(1) parser for any class is dependent more upon the table representation and compression (or the code generation if a direct parser is generated) than upon the class of grammar that the table generator handles.

The speed of the parser generator is somewhat dependent upon the class of grammar it handles. However, the original Knuth Article algorithms for constructing LR parsers was judged by its author to be impractically slow at that time. Although full LR is more complex than LALR(1), as computer speeds and algorithms improve, the difference (in terms of acceptable wall-clock execution time) is becoming less significant.

Potential authors are cautioned that the referenced DeRemer, Frank, and Pennello Article previously cited identifies a bug (an over-simplification of the computation of LALR(1) lookahead sets) in some of the LALR(1) algorithm statements that preceded it to publication. They should take the time to seek out that paper, as well as current relevant work, particularly Aho's.

The **-b** option was added to provide a portable method for permitting yacc to work on multiple separate parsers in the same directory. If a directory contains more than one yacc grammar, and both grammars are constructed at the same time (by, for example, a parallel *make* program), conflict results. While the solution is not historical practice, it corrects a known deficiency in historical implementations. Corresponding changes were made to all sections that referenced the file names **y.tab.c** (now "the code file"), **y.tab.h** (now "the header file"), and **y.output** (now "the description file").

The grammar for yacc input is based on System V documentation. The textual description shows there that the ' ; ' is required at the end of the rule. The grammar and the implementation do not require this. (The use of **C\_IDENTIFIER** causes a reduce to occur in the right place.)

Also, in that implementation, the constructs such as **%token** can be terminated by a semicolon, but this is not permitted by the grammar. The keywords such as **%token** can also appear in uppercase, which is again not discussed. In most places where '%' is used, '\' can be substituted, and there are alternate spellings for some of the symbols (for example, **%LEFT** can be "%<" or even "\<").

Historically, **<tag>** can contain any characters except '>', including white space, in the implementation. However, since the *tag* must reference a ISO C standard union member, in practice conforming implementations need to support only the set of characters for ISO C standard identifiers in this context.

Some historical implementations are known to accept actions that are terminated by a period. Historical implementations often allow '\$' in names. A conforming implementation does not need to support either of these behaviors.

Deciding when to use **%prec** illustrates the difficulty in specifying the behavior of yacc. There may be situations in which the *grammar* is not, strictly speaking, in error, and yet yacc cannot interpret it unambiguously. The resolution of ambiguities in the grammar can in many instances be resolved by providing additional information, such as using **%type** or **%union** declarations. It is often easier and it usually yields a smaller parser to take this alternative when it is appropriate.

The size and execution time of a program produced without the runtime debugging code is usually smaller and slightly faster in historical implementations.

Statistics messages from several historical implementations include the following types of information:

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 42803 | <i>n</i> /512 terminals, <i>n</i> /300 non-terminals                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 42819 | The format of the <b>y.output</b> file is not given because specification of the format was not seen to enhance application portability. The listing is primarily intended to help human users understand and debug the parser; use of <b>y.output</b> by a portable application script would be unusual. Furthermore, implementations have not produced consistent output and no popular format was apparent. The format selected by the implementation should be human-readable, in addition to the requirement that it be a text file. |

| 42835 | <b>CHANGE HISTORY</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 42836 | First released in Issue 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 42837 | <b>Issue 4</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 42838 | Aligned with the ISO/IEC 9945-2:1993 standard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 42839 | <b>Issue 5</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 42840 | FUTURE DIRECTIONS section added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 42841 | <b>Issue 6</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 42842 | Minor changes have been added to align with the IEEE P1003.2b draft standard.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 42843 | The normative text is reworded to avoid use of the term “must” for application requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                              |

42844 **NAME**

42845           zcat — expand and concatenate data

42846 **SYNOPSIS**42847 XSI       zcat [*file...*]

42848

42849 **DESCRIPTION**

42850       The *zcat* utility shall write to standard output the uncompressed form of files that have been  
 42851       compressed using the *compress* utility. It is the equivalent of *uncompress -c*. Input files are not  
 42852       affected.

42853 **OPTIONS**

42854       None.

42855 **OPERANDS**

42856       The following operand shall be supported:

42857       *file*           The path name of a file previously processed by the *compress* utility. If *file* already  
 42858       has the *.Z* suffix specified, it is used as submitted. Otherwise, the *.Z* suffix is  
 42859       appended to the file name prior to processing.

42860 **STDIN**42861       The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.42862 **INPUT FILES**42863       Input files shall be compressed files that are in the format produced by the *compress* utility.42864 **ENVIRONMENT VARIABLES**42865       The following environment variables shall affect the execution of *zcat*:

42866       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 42867       If *LANG* is unset or null, the corresponding value from the implementation-  
 42868       dependent default locale shall be used. If any of the internationalization variables  
 42869       contains an invalid setting, the utility shall behave as if none of the variables had  
 42870       been defined.

42871       *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 42872       internationalization variables.

42873       *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
 42874       characters (for example, single-byte as opposed to multi-byte characters in  
 42875       arguments).

42876       *LC\_MESSAGES*   Determine the locale that should be used to affect the format and contents of  
 42877       diagnostic messages written to standard error.  
 42878

42879       *NLSPATH*       Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

42880 **ASYNCHRONOUS EVENTS**

42881       Default.

42882 **STDOUT**

42883       The compressed files given as input shall be written on standard output in their uncompressed  
 42884       form.

42885 **STDERR**

42886           Used only for diagnostic messages.

42887 **OUTPUT FILES**

42888           None.

42889 **EXTENDED DESCRIPTION**

42890           None.

42891 **EXIT STATUS**

42892           The following exit values shall be returned:

42893           0   Successful completion.

42894           &gt;0  An error occurred.

42895 **CONSEQUENCES OF ERRORS**

42896           Default.

42897 **APPLICATION USAGE**

42898           None.

42899 **EXAMPLES**

42900           None.

42901 **RATIONALE**

42902           None.

42903 **FUTURE DIRECTIONS**

42904           None.

42905 **SEE ALSO**42906           *compress, uncompress*42907 **CHANGE HISTORY**

42908           First released in Issue 4.

## Portability Considerations (Informative)

42910

### Notes to Reviewers

42912 *This section with side shading will not appear in the final copy. - Ed.*

42913 This chapter needs a complete overhaul. Volunteers are wanted to tackle this task.

42914 This chapter contains information to satisfy the recommendations of the TSG-1 Final Report  
42915 Annex A:

42916 Section 5.1 describes perceived user requirements.

42917 • Section 5.2 on page 1129 indicates how the facilities of this volume of IEEE Std. 1003.1-200x  
42918 satisfy those requirements.

42919 • Section 5.3 on page 1132 offers guidance to writers of profiles on how the configurable  
42920 options, limits, and optional behavior of this volume of IEEE Std. 1003.1-200x should be cited  
42921 in profiles.

### 5.1 User Requirements

42923 This section describes the user requirements that were perceived by the developers of this  
42924 volume of IEEE Std. 1003.1-200x. The primary source for these requirements was an analysis of  
42925 historical practice in widespread use, as typified by the base documents listed Chapter 1 on page  
42926 1.

42927 The universe of users applicable to this volume of IEEE Std. 1003.1-200x is a superset of those  
42928 addressed by the System Interfaces volume of IEEE Std. 1003.1-200x: users requiring open  
42929 systems solutions for source-code portability of applications involving multi-programming and  
42930 process management (creating processes, signaling, and so on); access to files and directories in a  
42931 hierarchy of file systems (opening, reading, writing, deleting files, and so on); access to  
42932 asynchronous communications ports and other special devices; access to information about  
42933 other users of the system. The users of the System Interfaces volume of IEEE Std. 1003.1-200x are  
42934 limited to those employing applications written in high-level languages, such as C, Ada, or  
42935 FORTRAN.

42936 The following additional users are identified for this volume of IEEE Std. 1003.1-200x:

- 42937 • Users who desire portable applications that do not necessarily require the characteristics of  
42938 high-level languages (for example, the speed of execution of compiled languages or the  
42939 relative security of source code intellectual property inherent in the compilation process)
- 42940 • Users who desire portable applications that can be developed quickly and can be modified  
42941 readily without the use of compilers and other system components that may be unavailable  
42942 on small systems or those without special application development capabilities
- 42943 • Users who interact with a system to achieve general-purpose time-sharing capabilities  
42944 common to most business or government offices or academic environments: editing, filing,  
42945 inter-user communications, printing, and so on
- 42946 • Users who develop applications for POSIX-conformant systems

42947 An acknowledged restriction on applicable users is that they are limited to the group of  
42948 individuals who are familiar with the style of interaction characteristic of historically-derived

42949 systems based on one of the UNIX operating systems (as opposed to other historical systems  
42950 with different models, such as MS/DOS, Macintosh, VMS, MVS, and so on). Typical users would  
42951 include program developers, engineers, or general-purpose time-sharing users.

42952 The following subsections list the perceived requirements for this universe of users, in addition  
42953 to those identified by the System Interfaces volume of IEEE Std. 1003.1-200x.

#### 42954 **5.1.1 Command Language**

42955 Users should be able to define procedures that combine simple tools and/or applications into  
42956 higher-level components that perform to the specific needs of the user. The user should be able  
42957 to store, recall, use, and modify these procedures. These procedures should employ a powerful  
42958 command language that is used for recurring tasks in portable applications (scripts) in the same  
42959 way that it is used interactively to accomplish one-time tasks. The language and the utilities that  
42960 it uses must be consistent between systems to reduce errors and retraining.

#### 42961 **5.1.2 Interactive Facilities**

42962 Use the system to accomplish individual tasks at an interactive terminal. The interface should be  
42963 consistent, intuitive, and offer usability enhancements to increase the productivity of terminal  
42964 users, reduce errors, and minimize retraining costs. Online documentation or usage assistance  
42965 should be available.

#### 42966 **5.1.3 Accomplish Multiple Tasks Simultaneously**

42967 Access applications and interactive facilities from a single terminal without requiring serial  
42968 execution: switch between multiple interactive tasks; schedule one-time or periodic background  
42969 work; display the status of all work in progress or scheduled; influence the priority scheduling of  
42970 work, when authorized.

#### 42971 **5.1.4 Complex Data Manipulation**

42972 Manipulate data in files in complex ways: sort, merge, compare, translate, edit, format, pattern  
42973 match, select subsets (strings, columns, fields, rows, and so on). These facilities should be  
42974 available to both portable applications and interactive users.

#### 42975 **5.1.5 File Hierarchy Manipulation**

42976 Create, delete, move/rename, copy, backup/archive, and display files and directories. These  
42977 facilities should be available to both portable applications and interactive users.

#### 42978 **5.1.6 Locale Configuration**

42979 Customize applications and interactive sessions for the cultural and language conventions of the  
42980 user. Employ a wide variety of standard character encodings. These facilities should be available  
42981 to both portable applications and interactive users.

**42982 5.1.7 Inter-User Communication**

42983 Send messages or transfer files to other users on the same system or other systems on a network.  
 42984 These facilities should be available to both portable applications and interactive users.

**42985 5.1.8 System Environment**

42986 Display information about the status of the system (activities of users and their interactive and  
 42987 background work, file system utilization, system time, configuration, and presence of optional  
 42988 facilities) and the environment of the user (terminal characteristics, and so on). Inform the  
 42989 system operator/administrator of problems. Control access to user files and other resources.

**42990 5.1.9 Printing**

42991 Output files on a variety of output device classes, accessing devices on local or network-  
 42992 connected systems. Control (or influence) the formatting, priority scheduling, and output  
 42993 distribution of work. These facilities should be available to both portable applications and  
 42994 interactive users.

**42995 5.1.10 Software Development**

42996 Develop (create and manage source files, compile/interpret, debug) portable open systems  
 42997 applications and package them for distribution to, and updating of, other systems.

**42998 5.2 Portability Capabilities**

42999 This section describes the significant portability capabilities of this volume of  
 43000 IEEE Std. 1003.1-200x and indicates how the user requirements listed in Section 5.1 on page 1127  
 43001 are addressed. The capabilities are listed in the same format as the preceding user requirements;  
 43002 they are summarized below:

- 43003 • Command Language
- 43004 • Interactive Facilities
- 43005 • Accomplish Multiple Tasks Simultaneously
- 43006 • Complex Data Manipulation
- 43007 • File Hierarchy Manipulation
- 43008 • Locale Configuration
- 43009 • Inter-user Communication
- 43010 • System Environment
- 43011 • Printing
- 43012 • Software Development

43013 The shell command language, as described in Chapter 2 on page 35, is a common language  
 43014 useful in batch scripts, through an API to high-level languages (for the C-Language Binding  
 43015 option, *system()* and *popen()*) and through an interactive terminal (see *sh* on page 888). The shell  
 43016 language has many of the characteristics of a high-level language, but it has been designed to be  
 43017 more suitable for user terminal entry and includes interactive debugging facilities. Through the  
 43018 use of pipelining, many complex commands can be constructed from combinations of data  
 43019 filters and other common components. Shell scripts can be created, stored, recalled, and

43020 modified by the user with simple editors.

43021 In addition to the basic shell language, the following utilities offer features that simplify and  
 43022 enhance programmatic access to the utilities and provide features normally found only in high-  
 43023 level languages: *basename*, *bc*, *command*, *dirname*, *echo*, *env*, *expr*, *false*, *printf*, *read*, *sleep*, *tee*, *test*,  
 43024 *time*<sup>4</sup>, *true*, *wait*, *xargs*, and all of the special built-in utilities in Section 2.14 on page 96.

#### 43025 **Unsatisfied Requirements**

43026 None.

### 43027 **5.2.1 Interactive Facilities**

43028 The utilities offer a common style of command line interface through conformance to the Utility  
 43029 Syntax Guidelines (see the System Interface Definitions volume of IEEE Std. 1003.1-200x, Section  
 43030 12.2, Utility Syntax Guidelines) and the common utility defaults (see Section 1.11 on page 25).  
 43031 The *sh* utility offers an interactive command line history and editing facility. The following  
 43032 utilities in the User Portability Utilities option have been customized for interactive use: *alias*, *ex*,  
 43033 *fc*, *mailx*, *more*, *talk*, *vi*, *unalias*, and *write*; the *man* utility offers online access to system  
 43034 documentation.

#### 43035 **Unsatisfied Requirements**

43036 The command line interface to individual utilities is as intuitive and consistent as historical  
 43037 practice allows. Work underway based on graphical user interfaces (see Section 1.7 on page 10)  
 43038 may be more suitable for novice or occasional users of the system.

### 43039 **5.2.2 Accomplish Multiple Tasks Simultaneously**

43040 The shell command language offers background processing through the asynchronous list  
 43041 command form; see Section 2.9.3.1 on page 74. The *nohup* utility makes background processing  
 43042 more robust and usable. The *kill* utility can terminate background jobs. When the User  
 43043 Portability Utilities option and the POSIX.1 Job Control option are supported, the following  
 43044 utilities can support more complex background work: *bg*, *fg*, and *jobs*. With just the User  
 43045 Portability Utilities option, the following can support periodic job scheduling, control, and  
 43046 display: *at*, *batch*, *crontab*, *nice*, *ps*, and *renice*.

#### 43047 **Unsatisfied Requirements**

43048 Terminals with multiple windows may be more suitable for some multi-tasking interactive uses  
 43049 than the job control approach in this volume of IEEE Std. 1003.1-200x. See the comments on  
 43050 graphical user interfaces in Section 5.2.1. The *nice* and *renice* utilities do not necessarily take  
 43051 advantage of complex system scheduling algorithms that are being developed by realtime  
 43052 standards efforts; additional facilities are expected in future versions of this volume of  
 43053 IEEE Std. 1003.1-200x. More sophisticated job processing facilities will be introduced in a future  
 43054 version, based on work in supercomputing standards efforts.

43055 \_\_\_\_\_

43056 4. The utilities listed with an asterisk are present only on systems which support the User Portability Utilities option. There may be  
 43057 further restrictions on the utilities offered with various configuration option combinations; see the individual utility descriptions.

43058 **5.2.3 Complex Data Manipulation**

43059 The following utilities address user requirements in this area: *asa*, *awk*, *bc*, *cmp*, *comm*, *csplit\**, *cut*,  
 43060 *dd*, *diff*, *ed*, *ex\**, *expand\**, *expr*, *find*, *fold*, *grep*, *head*, *join*, *od*, *paste*, *pr*, *printf*, *sed*, *sort*, *split\**, *tabs\**, *tail*,  
 43061 *tr*, *unexpand\**, *uniq*, *uudecode\**, *uencode\**, and *wc*.

43062 **Unsatisfied Requirements**

43063 Sophisticated text formatting utilities, such as *troff* or *TeX*, are not included. Standards work in  
 43064 the area of SGML may satisfy this.

43065 **5.2.4 File Hierarchy Manipulation**

43066 The following utilities address user requirements in this area: *basename*, *cat*, *cd*, *chgrp*, *chmod*,  
 43067 *chown*, *cksum*, *cp*, *dd*, *df\**, *diff*, *dirname*, *du\**, *find*, *ls*, *ln*, *mkdir*, *mkfifo*, *mv*, *patch\**, *pathchk*, *pax*, *pwd*,  
 43068 *rm*, *rmdir*, *test*, and *touch*.

43069 **Unsatisfied Requirements**

43070 Some graphical user interfaces offer more intuitive file manager components that allow file  
 43071 manipulation through the movement of icons for novice users.

43072 **5.2.5 Locale Configuration**

43073 The standard utilities are affected by the various *LC\_* variables to achieve locale-dependent  
 43074 operation: character classification, collation sequences, REs and shell pattern matching,  
 43075 date/time formats, numeric formatting, and monetary formatting. When the  
 43076 POSIX2\_LOCALEDEF option is supported, applications can provide their own locale definition  
 43077 files. The following utilities address user requirements in this area: *date*, *ed*, *ex\**, *find*, *grep*, *locale*,  
 43078 *localedef*, *more\**, *sed*, *sh*, *sort*, *tr*, *uniq*, and *vi\**.

43079 **Unsatisfied Requirements**

43080 Some aspects of multi-byte character and state-encoded character encodings have not yet been  
 43081 addressed. The C-language functions, such as *getopt()*, are generally limited to single-byte  
 43082 characters. The effect of the *LC\_MESSAGES* variable on message formats is only suggested at  
 43083 this time, and utilities for message catalog manipulation have not been defined.

43084 **5.2.6 Inter-User Communication**

43085 The following utilities address user requirements in this area: *cksum*, *mailx\**, *mesg\**, *patch\**, *pax*,  
 43086 *talk\**, *uudecode\**, *uencode\**, *who\**, and *write\**.

43087 **Unsatisfied Requirements**

43088 The historical UUCP utilities are not included. This type of requirement will be addressed as  
 43089 part of networking standards efforts.

43090 **5.2.7 System Environment**

43091 The following utilities address user requirements in this area: *chgrp*, *chmod*, *chown*, *df\**, *du\**, *env*,  
 43092 *getconf*, *id*, *logger*, *logname*, *mesg\**, *newgrp\**, *ps\**, *stty*, *tput\**, *tty*, *umask*, *uname*, and *who\**.

43093 **Unsatisfied Requirements**

43094 Considerable extra control of security, privilege, and auditing facilities will be added in a future  
 43095 version, based on work underway in security standards efforts.

43096 **5.2.8 Printing**

43097 The following utilities address user requirements in this area: *pr* and *lp*.

43098 **Unsatisfied Requirements**

43099 There are no features to control the formatting or scheduling of the print jobs. Such facilities will  
 43100 be added in a future version, based on work underway in system administration standards  
 43101 efforts.

43102 **5.2.9 Software Development**

43103 The following utilities address user requirements in this area: *ar*, *asa*, *awk*, *c89*, *ctags\**, *fort77*,  
 43104 *getconf*, *getopts*, *lex*, *localedef*, *make*, *nm\**, *od*, *patch\**, *pax*, *strings\**, *strip*, *time\**, and *yacc*.

43105 The *system()*, *popen()*, *pclose()*, *regcomp()*, *regexexec()*, *regerror()*, *regfree()*, *fnmatch()*, *getopt()*,  
 43106 *glob()*, *globfree()*, *wordexp()*, and *wordfree()* functions allow C-language programmers to access  
 43107 some of the interfaces used by the utilities, such as argument processing, REs, and pattern  
 43108 matching.

43109 **Unsatisfied Requirements**

43110 There are no language-specific development tools related to languages other than C and  
 43111 FORTRAN. The C tools are more complete and varied than the FORTRAN tools. There is no  
 43112 source-code control system. There is no data dictionary or other CASE-like development tools.

43113 **5.3 Profiling Considerations**

43114 This section offers guidance to writers of profiles on how the configurable options, limits, and  
 43115 optional behavior of this volume of IEEE Std. 1003.1-200x should be cited in profiles. Profile  
 43116 writers should consult the general guidance in POSIX.0 when writing POSIX Standardized  
 43117 Profiles.

43118 The information in this section is an inclusive list of features that should be considered by profile  
 43119 writers. Further subsetting of this volume of IEEE Std. 1003.1-200x, including the specification of  
 43120 behavior currently described as unspecified, undefined, implementation-dependent, or with the  
 43121 verbs “may” or “need not” violates the intent of the developers of this volume of  
 43122 IEEE Std. 1003.1-200x and the guidelines of ISO/IEC TR 10000-1.

### 43123 5.3.1 Configuration Options

43124 There are three broad optional configurations suggested by this volume of IEEE Std. 1003.1-200x:  
 43125 basic execution system, development system, and user portability interactive system. The  
 43126 options to support these, and other minor configuration options, are listed in the System  
 43127 Interface Definitions volume of IEEE Std. 1003.1-200x, Chapter 2, Conformance. Profile writers  
 43128 should consult the following list and the comments concerning user requirements addressed by  
 43129 various POSIX.2 components in Section 5.2 on page 1129.

#### 43130 POSIX2\_UPE

43131 The system supports the User Portability Utilities option.

43132 This option is a requirement for a user portability interactive system. It is required  
 43133 frequently except for those systems, such as embedded realtime or dedicated application  
 43134 systems, that support little or no interactive time-sharing work by users or operators.

#### 43135 POSIX2\_SW\_DEV

43136 The system supports the Software Development Utilities option.

43137 This option is required by many systems, even those in which actual software development  
 43138 does not occur. The *make* utility, in particular, is required by many application software  
 43139 packages as they are installed onto the system. If POSIX2\_C\_DEV is supported,  
 43140 POSIX2\_SW\_DEV is almost a mandatory requirement because of *ar* and *make*.

#### 43141 POSIX2\_C\_BIND

43142 The system supports the C-Language Bindings option.

43143 This option is required on some systems developing complex C applications or on any  
 43144 system installing C applications in source form that require the functions in this option. The  
 43145 *system()* and *popen()* functions, in particular, are widely used by applications; the others are  
 43146 rather more specialized.

#### 43147 POSIX2\_C\_DEV

43148 The system supports the C-Language Development Utilities option.

43149 This option is required by many systems, even those in which actual C-language software  
 43150 development does not occur. The *c89* utility, in particular, is required by many application  
 43151 software packages as they are installed onto the system. The *lex* and *yacc* utilities are used  
 43152 less frequently.

#### 43153 POSIX2\_FORT\_DEV

43154 The system supports the FORTRAN Development Utilities option

43155 As with C, this option is needed on any system developing or installing FORTRAN  
 43156 applications in source form.

#### 43157 POSIX2\_FORT\_RUN

43158 The system supports the FORTRAN Runtime Utilities option.

43159 This option is required for some FORTRAN applications that need the *asa* utility to convert  
 43160 Hollerith printing statement output. It is unknown how frequently this occurs.

#### 43161 POSIX2\_LOCALEDEF

43162 The system supports the creation of locales.

43163 This option is needed if applications require their own customized locale definitions to  
 43164 operate. It is presently unknown whether many applications are dependent on this.  
 43165 However, the option is virtually mandatory for systems in which internationalized  
 43166 applications are developed.

43167 POSIX2\_CHAR\_TERM

43168 The system supports at least one terminal type capable of all operations described in this  
43169 volume of IEEE Std. 1003.1-200x.

43170 On systems with POSIX2\_UPE, this option is almost always required. It was developed  
43171 solely to allow certain specialized vendors and user applications to bypass the requirement  
43172 for general-purpose asynchronous terminal support. For example, an application and  
43173 system that was suitable for block-mode terminals, such as IBM 3270s, would not need this  
43174 option.

### 43175 5.3.2 Configurable Limits

43176 Very few of the limits in Section 1.9 on page 21 need to be increased for profiles. No profile can  
43177 cite lower values.

43178 {POSIX2\_BC\_BASE\_MAX}

43179 {POSIX2\_BC\_DIM\_MAX}

43180 {POSIX2\_BC\_SCALE\_MAX}

43181 {POSIX2\_BC\_STRING\_MAX}

43182 No increase is anticipated for any of these *bc* values, except for very specialized  
43183 applications involving huge numbers.

43184 {POSIX2\_COLL\_WEIGHTS\_MAX}

43185 Some natural languages with complex collation requirements require an increase from  
43186 the default 2 to 4; no higher numbers are anticipated.

43187 {POSIX2\_EXPR\_NEST\_MAX}

43188 No increase is anticipated.

43189 {POSIX2\_LINE\_MAX}

43190 This number is much larger than most historical applications have been able to use. At  
43191 some future time, applications may be rewritten to take advantage of even larger  
43192 values, but this is unlikely at the present time.

43193 {POSIX2\_RE\_DUP\_MAX}

43194 No increase is anticipated.

43195 {POSIX2\_VERSION}

43196 This is actually not a limit, but a standard version stamp. Generally, a profile should  
43197 specify this volume of IEEE Std. 1003.1-200x by a name in the normative references  
43198 section, not this value.

### 43199 5.3.3 Optional Behavior

43200 In this volume of IEEE Std. 1003.1-200x, there are no instances of the terms unspecified,  
43201 undefined, or implementation-dependent, or the verbs “may” or “need not” that the developers  
43202 of this volume of IEEE Std. 1003.1-200x anticipate or sanction as suitable for profile or test  
43203 method citation. All of these are merely warnings to portable applications to avoid certain areas  
43204 that can vary from system to system, and even over time on the same system. In many cases,  
43205 these terms are used explicitly to allow for extensions, but profiles should not anticipate and  
43206 require such extensions; future versions of this volume of IEEE Std. 1003.1-200x may do so.

|    |                                         |      |                                             |          |
|----|-----------------------------------------|------|---------------------------------------------|----------|
| 2  | _POSIX_VDISABLE.....                    | 929  | crontab.....                                | 310      |
| 3  | actions equivalent to functions.....    | 13   | fg.....                                     | 476      |
| 4  | admin.....                              | 160  | jobs.....                                   | 555      |
| 5  | ADV.....                                | 14   | nice.....                                   | 698      |
| 6  | AIO.....                                | 14   | nohup.....                                  | 711      |
| 7  | alias.....                              | 165  | renice.....                                 | 856      |
| 8  | alias substitution.....                 | 40   | BAR.....                                    | 14       |
| 9  | AND lists.....                          | 75   | basename.....                               | 222      |
| 10 | AND-OR list.....                        | 73   | batch.....                                  | 225      |
| 11 | appending redirected output.....        | 61   | bc.....                                     | 228      |
